Jane Crawford was the heroic woman of Green County, Kentucky, who rode horse back sixty miles to Danville, Kentucky, and there submitted to the first operation known as "Ovariotomy," performed by the unknown backwoods physician and surgeon, Ephraim McDowell, who later became world famous for this and other notable surgery

Mrs Crawford recovered from the operation and rode back to her home in Green County where she continued to live for some years Later, with her family she moved to Indiana Following the death of her husband, Thomas Crawford, she went to live with her son, the Rev James Crawford, a Presbyterian minister, who lived on a farm just across the road from the cemetery where his mother, the remarkable Jane Crawford of pioneer surgery, now sleeps

Perhaps some of the Auxiliary members may find an opportunity to visit this sacred spot during the coming summer while motoring in

Indiana

CARBON MONOXIDE IN GARAGES

The statistics of ambulance services in New York City show that a surprising number are for the resuscitation of persons who start their cars with the doors of the garage closed Commenting on the frequency of these accidents the Journal of the American Medical Association for February 11 says

One might suppose that the menace of carbon monoride had been brought sufficiently to the attention of the public to avert frequent disaster. Apparently this is not yet the case Carbon monoride originates from the incomplete combustion of carbonaceous material. It is a component of illuminating gas which formerly occasioned nearly all the cases of poisoning with the compound. Today the automobile supplies the greatest danger. According to Henderson and Haggard the exhaust gas from internal combustion engines contains carbon monoride in percentages range. (Continued on page 414—adv xmi)

SEALED AMBER BOTTLES

Protect the Vitamin Potency of

PATCH'S FLAVORED COD LIVER OIL

It is now generally agreed that cod liver oil is the richest known source of vitamin A and anti-rachitic vitamin. In the administration of cod liver oil, however, much depends upon the vitamin potency of the oil which is prescribed.

the vitamin potency of the oil which is prescribed.

Patch's Flavored Cod Liver Oil is recognized by the profession as a dependable highly potent product which gives definite results. This product is made in the Patch Company plants along the North Atlantic Coast from strictly fresh livers In addition to the land plants the Patch Company operates cookers on trawlers which sail out of the New England ports. On these trawlers the oil is made within a very short time after the fish are hauled in over the side of the boat. A sample of every lot of oil produced is biologically assayed. The vitamin potency is guaranteed. In order to preserve the high vitamin potency Patch's Flavored Cod Liver Oil is bottled at once in amber glass bottles to keep out the light. It is also promptly sealed to keep out the air. These precautions are taken because light and air destroy vitamin potency. Thus Patch's Flavored Cod Liver Oil reaches the patient in its original potent condition.

Children really enjoy Patch's Flavored Cod Liver Oil

Children really enjoy Patch's Flavored Cod Liver Oil because it tastes good. If you can give a small dose of highly potent and pleasantly flavored cod liver oil the problem of administration is solved.

Any Artistic Workman Can Produce a Handsome Artificial Limb

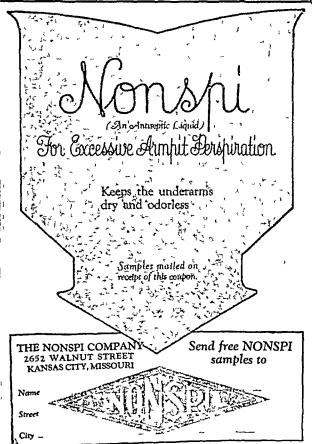

But what about fitting the stump? What about the alignment of the artificial limb? What about durability? What about pressure at the sensitive points? Not to mention such important matters as the special care of the stumps of diabetic patients

The manufacture of artificial limbs is a science as well as an art. Mastering it is the work of a lifetime. The house of A A MARKS, Inc., has given three generations to this work, and respectfully places its skill at the disposal of your patients.

ing from a fraction of 1 per cent to 7 per cent or even higher The variation depends on the proportion of air and gasoline in the mixture burned, the carbon monoxide increases with increase in the proportion of gasoline, that is, with a rich mixture A rough estimate of the volume of carbon monoxide that an automobile may produce is 1 cubic foot (28 liters) a minute for each 20 horse power This is sufficient to render the atmosphere of a single car garage deadly within five minutes, if the engine is run while the garage doors are closed A man breathing such an atmosphere often falls helpless before he realizes that he is affected, hence many fatalities In streets where traffic is congested, the content of carbon monoxide rises to about 100 parts per million of air, enough to cause slight headache after long exposure

According to a careful investigation, 400 parts of carbon monoxide per million of air is a maximum that may be endured by persons for one hour without noticeable effects, and 100 parts per million may be taken as a maximum for continuous exposure for about seven hours a day without noticeable effects. The facts on record indicate that the ventilation of garages will still bear careful watching if the atmosphere developed in them, particularly in severe weather, is to be retained above reproach from the point of view of hygiene

POLITICS IN PUBLIC HEALTH

The Wyoming section of Colorado Medicine, the organ of the medical societies of Colorado and Wyoming, in the February Journal says editorially

"Secretary Hassed of the State Board of Health has called a meeting in Cheyenne of all of the county health officers of the state It is understood that the health officers are planning to form a state association move in the right direction, if it does not become a political machine, but it is starting out with a bad handicap in as much as every one of the officers belong to one political partya condition which has never existed before, and if there is any part of the state administration which should be kept out of politics, the Health Department is that one that should The idea of rewarding political acbe free tivity by appointment as a health officer is nauseating in the extreme, and it is doubtful if the plain citizens of Wyoming will stomach

MEDICAL LEGISLATION IN VIRGINIA

The Virginia Medical Monthly for March contains the following editorial summary of the medical bills that were before the State Legislature—Editor's note

At the present session of the Virginia Legislature, the public policy and public health committee of the Medical Society of Virginia, acting jointly with the legislative committee of the State Medical Examining Board, undertook four major objectives and at the present time has apparently accomplished all that could be desired under the circumstances

The unlicensed chiropractors introduced a bill which had for its purpose the creation of a chiropractor board and other conditions pertaining thereto. The committee on general laws of the House of Delegates, on January 27th, by a vote of 12 to 1 refused to report the bill out of the committee, which means its defeat

A bill introduced in the Senate by our committee to repeal the DeCollard poropath bill, enacted during the session of 1918, was favorably considered by the Senate committee, passed by the Senate and has been read for the second time before the House, and passed on for the third reading by a vote of 82 to 6 This infamous poropath act will now be removed from the statutes of Virginia

Another bill introduced by our committee, to prohibit the operating of a "diploma mill," or the practicing of any one who is a graduate from a "diploma mill," is now being held up by the committee's request

Acting upon the authority of the society at the Petersburg meeting, our committee also introduced a bill to re-enact the present medical laws The entire bill was rearranged, though not changed in substance, and is now on the calendar of the House for the second reading, after having been recommended by the committee on general laws with a vote of 12 to 1 This bill puts all persons who practice the "art of healing" on the same basis, before the medical examining board, and is satisfactory to the homeopaths, osteopaths, chiropodists and optometrists, as well as the Christian Science healers The chiropractors, who were legalized by the acts of 1916, are not disturbed in any way, except in the sense of being required to conform to the state health laws and to the standard ethics on advertising Of course no recognition is made of the chiropractors who began practicing after January There are about 72 of these, and 17 legalized chiropractors Both of these groups have combined, have employed an attorney and are exercising every effort to defeat our bill

(Continued from page 415-adv six)

The Society's committee has had a very strenuous existence ever since the General Assembly convened in combating the situations developed by the chiropractors Strange as it may seem, some of our representatives are most energetic in their behalf There has been a general lack of interest on the part of the rank and file of the profession throughout the state, which has thrown the entire responsibility on the shoulders of the committee, and even when called upon by telegram, a number of prominent physicians have not seemed to know what the committee was endeavoring to do

It is almost impossible for the committee, who are strangers to a large number of the representatives, to satisfy any particular member of the General Assembly, when the latter's own physician has not taken the trouble to inform him as to the menace of drugless healers, who have persistently lobbied against all the rules, against the State Board of Health, toxin-antitoxin, vaccination, the conception of germ diseases and everything else that is in opposition to their monetary gain

In the next issue we hope to report that the re-enactment bill will have passed so that in the future when there are any violations of the law the statute as now written will be clear and prosecution can be secured

HALF TRUTHS

The March 8th issue of the New England Journal of Medicine has an editorial on Social Ethics versus Medical Ethics, from which the following abstract is taken. Editor's note.

The Professor of Social Ethics at Harvard has recently been quoted in the press as having stated before a lay audience that only nine out of some 215 known diseases exist for which the medical profession has remedies that are absolutely necessary for the life of the person If one resorts to quibbling over terms, an argument in favor of the exact truth of this statement may be made, and the professor specializes in exact truths. The knife is not absolutely necessary for the life of the patient with acute appendicitis or empyema, the malarial patient may survive without quinine or the victim of diphtheria without antitoxin

The implication to be derived from a casual reading of this report is that the need of a physician is real in only nine diseases, that the remaining 206 will cure themselves as a result of the benefit only of good nursing Feeling that the professor of Social Ethics must have been misquoted by the newspaper, the Journal asked him to correct some of the apparent inaccuracies in the report, but the

(Continued on page 417-adv \$31)

(Continued from page 416-adv xx)

reply seems to indicate that he was not mis-

quoted

The exact truth, even if we admit that these statements were the exact truth, may frequently create distinctly false impressions if it is not properly interpreted and explained for the benefit of those who have not a detailed knowledge of the subject. The professor's undensed statements certainly create the impression that he believes the medical profession to be of little value except in the specific instances of nine diseases He does not qualify his statement by explaining that medical attention in many more diseases may make the difference between health and invalidism, between comfort and pain, between happiness and misery He does not explain that medical attention and guidance may frequently be the means of averting disease and promoting the fullest enjoyment of health, he neglects to state that through the offices of the medical profession the public health is what it is, instead of what it might be, he neglects to state that there are twice nine diseases for which specific remedies exist which may cure, even if death is not always the alternative to cure, he makes no mention of the many conditions in which surgery is actually a life-saving pro-

In his remarks the professor shows that he fails to appreciate or wilfully neglects to analyze for the benefit of the public the true scope of medicine in these modern days knowledge of medicine is gained with travail and employed with difficulty It is designed for the good of the public and can reach the peak of its usefulness only through education of the public to understand and appreciate its manifold blessings The professor beyond others is in a position to aid in that education, for the public holds him as a prophet in the land, but his opportunity has been neglected, instead of teaching his following to avail itself of the opportunities opened to them, he has made statements which tend to create a feeling of distrust, of disillusionment towards the profession of which he is a member and which has in the past so often flocked to his standard

WORKMEN'S EXAMINATIONS

A physician wishing to give convincing reasons why applicants for employment should undergo a physical examination will be interested in the following article by Dr. E C Jackson printed in the March issue of the Journal of the Medical Society of New Jersey—Editor's note.

Second Edition, Revised and Enlarged

Bodkin's Diseases of the Rectum

By MARTIN L. BODKIN, MD., F.ACS

Rectal Surgeon, St Catherine's Hospital Associated Surgeon, Broad Street Hospital, New York.

The entire text for this edition has been carefully revised and amplified. Several important new chapters have been added.

The application of bacteriology to the causes of the different types of the simple catarrhal diseases of the colon and rectum and the treatment of these diseases are satisfactorily explained in a special chapter. This information of the cultivation of bacteria from the food we eat has heretofore been so meager that the average practitioner and student could not apply his knowledge in a practical manner to either medicine or surgery

PATERNALISM

People generally expect the government or social agencies to regulate unhygienic conditions, especially when they affect the other fellow. Yet there is a widespread resentment when an agency actually attempts the regulation, for American citizens act on the principle of personal liberty, however, much they may believe in paternalism in the absence.

The groups of persons organized for health and social purposes are doing a noble and necessary work in every community, but they meet opposition and criticism. An example of such criticism is the following quotation from the Ohio State: Medical Journal for March— Editor's note

Once upon a time, as all good fairy yarns go, a "man's home

was his castle"

That was before the days of the modern Knights and Ladies of Social Uplift and Welfare, with their heavily laden purses of philanthrophy and government subsidies

Under the broad banners of humanitarianism these phalanxes swarmed over communities, investigating, regulating, charting and photographing the habits, characteristics, personalities, weaknesses and strengths of the individuals

Government itself was drafted into service to aid in accomplishing the objectives sought by these saviors in their rush to revolutionize living conditions and standardize humanity

The Nation's Business, in a current issue, comments upon this trend briefly, but with such clarity that it should appeal to every thoughtful citizen

"How government grows and grows!" this Journal remarks "Here are two paragrphs from in interview with Lieut Mina Van Winkle, head of the woman's bureau of the Washington Police department, urging the development of her department.

'The work of the women's bureau is analogous to the mo-

tion picture constantly passing across the screen without intermission or stoppage. The pictures are of the skeleton closets of a big cross-section of the people and their communities, largely respectable although sometimes there are dips down into the slums and the underworld.

"But what of the ghosts of the They are of skeleton closet? many forms, the cheap, nasty theatre, the unsupervised dance hall, the unmarried mother, the runaway boy, the foolish shoplifter, the child of the street, the distracted mother unable to control her daughter, and a thousand other specters of sordid unhappy problems which, if properly and promptly adjusted, could come from the uneasy closet into the sun of the living room "

All of these conditions are regrettable, all of them need regulation If Mrs Van Winkle can regulate a "distracted mother unable to control her daughter" why not let her regulate my son? At what point in our passion for regulation of individual life shall we stop? We used to feel that a police department was for the protection of life and property from attacks of others But it seems to be coming to a point where it is the purpose of the police to protect the individual from himself, and further relieve parents and school and church of their time-honored responsibilities

LISTER'S OBSERVATION OF INFLAMMATION

The Wisconsin Medical Journal for March quotes the following description of inflammation written by Lord Lister in 1855 —Editor's note

I am now really doing work I have long wished to see the process of inflammation in the frog s foot and, as I think I one told you, felt that the early stages of that process had not been traced as they might be so as to see the transition from a state of healthy increased red-

INCORPORATED

31 Union Square New York City (Continued from page 419—adv xxii) ness to inflammation Accordingly, having for some weeks past been getting together the necessary apparatus and having gotten a frog from Duddington Loch I proceeded last evening to the investigation

I had the frog so placed that I could inject anything into the web under the microscope with a syringe By using a two-thirds object glass I had a fine large field of view and had under observation always the same artery, of the field of capillaries into which it divided to the two veins which returned the flow from them, and thus I was able to watch with great precision the effects produced I first threw on water of about 80 degrees, which had the effect of causing the artery to contract to obliteration almost for a few seconds, then tollowed a dilatation to a little above the natural caliber, when the flow of blood was greater than natural After a few seconds more the natural caliber was resumed, the warm water having previously flowed away from the web Then I threw on successively hotter and hotter water with the same effect that the subsequent dilatation was greater when the temperature was hotter, until at last I used water at nearly 200 degrees, and pretty long contin-The effect of this was a degree of dilatation of the artery far greater than ever before, two or three times its natural caliber, and at first an enormously increased flow of blood, the capillary network becoming far more red than natural and each capillary beginning to admit three or four corpuscles abreast instead of only one, as seen in the figure But this could not go on for long for the capillaries becoming distended and stuffed with the red corpuscles, the blood was first retarded and then stagnant Thus with the simplest of substitutive heat I traced the process of inflammation in the beginning

CERVICAL ADENITIS*

A Surgical Consideration

By R. FRANKLIN CARTER, M.D., NEW YORK, N. Y.

/ / \

E NLARGEMENT of the lymp nodes of the head and neck regions, resulting from infection or its products within the cervical lymph system, is a common medical problem—one which receives a variety of treatment by both the medical and surgical men of the profession. However, when the problem is reduced to one of infection and placed upon a common basis of infection in general, it is neither one for the medical nor surgical specialists, but simply one of infection, conforming to the rules laid down for infection, and all its factors should be met and dealth with accordingly

A working knowledge of the anatomy of the lymph system of this region is the first requisite, and fortunately this can be acquired in the poorest library from any standard text-book on anatomy It does not require extensive dissection either upon the living or dead to learn from what region a group of nodes receives their lymph supply, nor does it require any elaborate differential diagnostic method to determine the group of nodes in-The lymph nodes in this region are sufficiently distinct in location to enable the examiner to distinguish with every assurance, the exact group involved, and upon determining the group in which the affected node lies the point of entrance of the infection may be said to be in a known region. If the node is primarily involved, or if it be secondarily involved, evidence to that effect is present in the enlargement or reaction of the nodes in the primary group

On the skin surface of the extremities, a portal of entry is readily found and given credit for being such in patients with lymphangitis and lymphadenitis as the superficial lines of inflammatory redness attest, leading from the affected zone to the one of secondary infection in the lymph nodes. In the lymph system of

Read at the Annual Meeting of the Medical Society of the State of New York at Nagara Falls \ Y, May 11 1927

the head and neck, the lymph channels from the mucous and cutaneous surfaces are not in a position to show the path of infection when there is an inflammatory reaction present, so it is more natural to look upon the node itself as the offending agent But when viewed as a problem of infection the node remains a secondary problem and should be so dealt with

A review of patients in which variations have been found is of no value as the variations are not constant. More important are those patients in which experience has uncovered unexpected and previously unrecognized sources of infection. This latter group is enlarging with the increasing number of patients and that group, classed as the undetermined source of infection, is diminishing. Especially in children the portal of entry may be difficult to discover.

Because of the large number of submaxillary lymph node infections in infants, attention was directed toward this group and it was found they were free from common lesions to explain the entrance of infection. Classification of patients as to their ages showed this type of patient to be in the teething age and to come almost invariably from that class of people in which hygienic preparation of the articles for feeding the child, both by artificial and natural methods, was least respected. While in this instance the portal of entry cannot be closed to infection virulent infection can be prevented by proper instruction of the mother in the cause and relief

Eczema and impetigo are well recognized as producing lesions through which infection may gain entrance, pediculi however may cause such a mild dermatitis as to escape notice were not the evidence of the infection apparent in other deposits of the pediculi

Acute lesions in the nasopharynx, either those accompanying the ordinary infectious diseases or occurring singly, more often produce a toxic form of lymphadenitis which does

The Nelson Re-Constructive (Plastic) Surgery by Dr Ferris Smith, AB, MD, FACS, Head and Neck Surgeon to Blodgett Memorial Hospital, Plastic Surgeon to St Mary's Hospital, Grand Rapids, Assoc Surgeon and Lecturer at the International Clinic of Plastic Surgery, Paris, represents a new departure in medical book publishing, making use of the Loose-leaf binding device which for years has been in use in all banks and business houses and has been so successfully adapted to the publication of medical books by Thomas Nelson & Sons

A special feature of Plastic Surgery made possible by the Loose-Leaf System is a series of 88 stereoscope plates which can be removed from the volumes and examined with the stereoscope which is furnished with the These plates illustrate in the minutest detail the technique of various procedures described, giving the surgeon an idea of the various steps that is impossible with the use of the usual flat illustrations

We refer to page 34 in this issue of the New York State Journal of Medi-CINE for a full description of this new work. It is the most practical that we have ever seen for giving details of surgical technique, showing the various operations step by step, practically doubling the value of the work Nearly 200 other illustrations-drawings and photographs—enrich the text—Adv

BOWEL SLUGGISHNESS

In an investigation of the causes and treatment of various types of chronic constipation, Lohrisch and others have emphasized the value of restoring the feces to a soft, yielding state

In this way they claim that normal peristalsis can be obtained in a purely mechanical fashion and in a manner which does not run counter to natural processes

Far superior, therefore, to the usual type of cathartic or laxative is the use of Petrolagar-an emulsion of mineral oil with agar-agar

With Petrolagar the action is purely mechanical and when prescribed together with a regimen of appropriate diet and exercise, natural results are obtained and the period of bowel re-education materially shortened -Adv

COW'S MILK AND WATER

The doctor knows the importance of breast milk in relation to infant feeding It is "the voice of nature" calling for a healthy, well-nourished ınfant

The absence of breast milk constitutes an emergency in the life of every infant. When such an emergency comes to the doctor's own infant, it is significant how many physicians unhesitatingly turn to the best known substitute for breast milk-namely, cow's milk, water and Mead's Dextri-Maltose

WHY DRY MILK?

The production of clean milk is en gaging the attention of health authori ties to a greater extent than ever before The heavy toll in lives which liquid milk has taken in the past and is still taking, notwithstanding many regulations and inspections by Health Departments, has called for efforts on the part of all milk producers to reduce this milk hazard

In 1893 pasteurization was first at tempted Pasteurization has done much to eliminate milk-borne infections How ever in order to be safe, milk must be carefully pasteurized and health au thorities everywhere are taking steps to see that the pasteurization is carefully carried out This, of course, involves the human equation, and there are rec ords of many epidemics caused by milk supposed to have been pasteurized in which pasteurization has been faulty −Adv

FOR THE TREATMENT OF **PNEUMONIA**

The vaccine treatment of pneumoma has not given very satisfactory results. With the purpose of obviating the chief difficulty in the vaccine therapy of this disease, namely, tardiness of action, Parke, Davis & Co have brought out a new antigen, one that represents the vaccine principle but acts much more It is called Pneumococcus rapidly

Vaccines are killed bacteria. Pneu mococcus Immunogen is obtained from cultures of the three specific types of pneumococcus, but there are no bacteria, dead or alive, in it It seems, from the researches conducted and published by Parke, Davis & Co, that the antigenic principle of bacteria is not so much in the bacteria as on them, it can be washed off Pneumococcus Immunogen consists of the washings of pneumococci, tested serologically to demonstrate its superiority to a corre sponding bacterial vaccine.

The Immunogen is administered, as a rule, intramuscularly, though it can be given intravenously in smaller doses, and the injections may be repeated at virulence or quantity of the invading force, or in the strength of resistance on the part of

the particular host

The age of the individual, character of onset, and course of enlargement, together with careful history of conditions in region drained by that particular group of nodes, furnish grounds for differential diagnosis from tumors of lymph nodes

Finding and attending to the focus of infection is the primary step in importance and sequence of the treatment of the case. The area indicated by the anatomical division of the lymph system is most often found to be the nasopharynx with its superficial lymphoid structure, favorable for the harboring of infection of a chronic variety, low grade pathogenic organisms, and for the entrance of tuberculosis infection. Low grade pathogenic infection about the apex of a decayed or uninterrupted tooth is a common focus in the adult. Treatment directed toward the node itself should never be surgical removal in this stage.

Removal of the enlarged nodes without locating and attending to the original focus will lead to difficulty in both the pyogenic and tubercular varieties. In the former by the occurrence of the infection in the adjoining nodes of the same group or in nodes of the next group in sequence, and in the latter by permitting an active tubercular focus to continue unhampered by the natural protective forces, the lymph nodes Enlargement of nodes from tubercular infection is often the only external evidence of a tubercular invasion and they should receive secondary attention in the treatment of the individual as a whole Where inferior deep cervical or axillary nodes are involved the tubercular process has come from the lungs by way of the periboncial lymph nodes which receive tubercular bacilli when picked up by the primary lymphaticis in the The tubercular abscess in the lung may rupture into a bronchus and the material be coughed up into the pharynx and the bacilli find their way into the superior deep cervical group through the tonsil or adenoid tissue In addition, tubercle bacilli from outside sources may gain entrance to the superior deep cervical group directly through the tonsil and adenoid tissue. The first and second route of entry of infection into the cervical lymph nodes may be present in the same individual but one should never assume the third or outside source to be present until the lungs have proven to be negative both clinically and by the X-ray

When there are other areas of infection in the bones, joints, or lungs or a history of exposure to active adult type, the infection should be classed as the adult type When after dilgent search no other focus of infection nor history of exposure can be ascertained and only where the superior deep group are involved should the Bovine type of bacillus be considered the existing cause. In this latter group local measures alone will suffice, namely, removal of infected lymphoid tissue in the nasopharynx, X-ray stimulation of the nodes and general attention to hygiene such as may be carried out without institutional observation

The majority of those infected with the adult type in addition to the local measures should have the best treatment available for the care of the tubercular Absolute rest, sunlight and strict observation of the dietary

Scar formation together with calcification of a tubercular node may leave an unsightly mass in an exposed area which in itself is more objectionable than a scar in that area would be, when that occurs surgical removal may be the procedure of choice for cometic reasons

X-ray stimulation offers the best means of hastening repair in the tubercular and pathogenic variety, both in the struggle on the part of the node to overcome and render inert substances, either bacterial or toxic, which have entered to cause the reaction and in restoring the node to its normal functioning state. Destructive X-rays are of course contraindicated as that would enhance the action upon the protective forces of deleterious substances, usually bacterial in character, and permit the process to continue to the purulent stage.

Vaccinotherapy in the patients with an active pyogenic focus will be of use only in the most favorable of patients. And the very nature of the condition, being chronic, excludes the use of vaccine. For a vaccine made from weakened organisms, taken from a chronic discharging focus, has little stimulating force. In the case of an exacerbation of a chronic focus, where the culture for vaccine can be obtained from the area of infection, benefit from subcutaneous injection of a properly prepared vaccine will follow when the infection is due to staphyloccus.

Acute Purulent Inflammation follows simple acute inflammation or occurs when virulent bacteria gain entrance in sufficient number to overwhelm the resisting forces of the attacked In this instance the node receives primary consideration because of the failure of the resisting forces to successfully cope with the invading force Primary treatment of the node affected does not reduce the necessity for searching out and blocking the point of entry fected tonsils and teeth should be removed without delay when not themselves, the seat of acute inflammation and subcutaneous or submucous infections treated at once and radi-Removal of the adjoining nodes in the same group is the most treacherous thing to be

not as a rule undergo purulent degeneration. These lesions from custom receive primary attention and the inflammation in the lymph system receives scant notice, oftentimes not a thought is given to the enlargement of the nodes—from experience they are known to re-

FIGURE I
Cervical Lymph Nodes (from Toldt)

cede in such patients. However, in the other and larger group of patients with lymphadenitis in those nodes receiving lymph from the nasopharynx, the lesion acting as a portal of entry is not acute and often cannot be recognized as an infected zone by one not especially traied to do so. Therefore, it rests with all who may assume the responsibility in such a case to know the lymph anatomy and be prepared to direct a given patient to one especially fitted for detecting a source of infection in the area indicated by the node affected—a submaxillary node infection to the dentist and a superior deep cervical to the nose and throat specialist and not vice versa

Classification of disease is the keynote in its treatment. Upon classification depends the type and variety of treatment and upon experience, teaching and a knowledge of infection within this area depends the ability to classify. When once the reaction has been classified the treatment has been determined. The reaction to infection or its products may conveniently be classified as Simple inflammation.

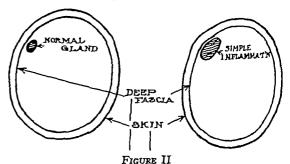

acute and chronic, and purulent inflammation, acute and chronic.

Simple Acute Inflammation, accompanying affection of the skin and mucous membranes in this region, is so common that attention is seldom centered upon the nodes involved, especially that enlargement of nodes occurring with and following the acute infectious diseases of childhood, and other self limited infections in which the portal of entry is closed by the natural course of the disease or those in which the inflammatory reaction is toxic and not bacterial

Enlargement of the nodes from congestion, edema and active hyperplasia of the lymphoid elements without fixation, fluctuation, tenderness to pressure, swelling of surrounding structures and redness of skin denotes a simple inflammatory process which terminates in complete resolution. Ending thus these patients are not usually classed among the so-called "glands of the neck" but from them valuable points of information concerning the extent and origin of the infection may be obtained

Treatment consists in making a differential diagnosis, treating the origin of infection and not molesting the nodes. Simple acute inflam mation in one group receiving both primary and secondary lymphatics from the area in which the source of infection lies may be of aid in narrowing the field of search in locating the source of the acute purulent type, viz, simple enlargement of the preauricular, abscess in the superior deep cervical, and focus a chronic con junctivitis

Simple Chronic Inflammation comprises that group in which diagnosis becomes a real differential problem. Chronic enlargement of the lymph nodes throughout the entire cervical region, accompanying enlargement in other regions of the body, are not included and do not come under the principles of cause and treat-

Schematic representation of the important structures.

ment therein outlined But when there is simple enlargement in a single group or chain of nodes, the reaction varies only in degree from that occurring in the other types under consideration. The cause may be similar and from the same source differing in either the

when made 1/4 inch in length, placed in the crease of the neck, made at the proper time and drained 48 hours only

Opening the abscess after it has perforated the superficial division of deep cervical fascia and destroyed the intervening fat requires simple puncture with no further drainage. The fat having been destroyed it is never replaced, the skin becomes adherent to deep fascia and a fixed depression occurs which varies in depth with the thickness of adipose tissue present, for which the only cure is excision and bringing together the normal layers of the adjacent fat and skin

Opening a superficial abscess at its margin permits sinus formation if drainage is used for 48 hours and results in a depression over site of abscess but without scar fixation by adherence of the skin to fascia unless all the fat between the fascia and skin has been destroyed

Chronic Purulent Inflammation includes two groups of patients. Those having had a cervical abscess which was opened or opened spontaneously which continues to drain or breaks through afresh with a discharge of pus and detritus at intervals (the primary abscess may have been acute or chronic in its development), and those developing slowly without signs of acute inflammation but with evident necrosis and pus formation at the time of presenting, themselves for treatment. The type of infection may be the same for both groups

The cause for the course of infection becoming chronic in the first group, that of chronic discharge, lies in the method employed Either the focus of infection had not been removed or the entire node had not been destroyed when the abscess was opened Non-removal of a chronic focus of infection, which is active and supplying infectious material, is a cause for many discharging sinuses in that they furnish added fuel for the flame and fan the flame by weakening the host in its general resisting The remains of a node in the wall of an abscess heals slowly, granulates profusely, and furnishes favorable breeding ground for the slow growth of bacteria, which process produces a constant discharge sufficient to keep open a sinus for a considerable length of time When, however, the entire node has been destroyed before its capsule is ruptured, the connective tissue abscess wall will readily resolve and in that process the products of resolution are absorbed and no discharge continues

The chronic pyogenic form, characterized by a thick purulent discharge without caseous or calcified material, responds to treatment directed toward stimulation of the process of resolution, as does the tuberculous variety with a thin flaky discharge often containing calcified

substance The type of reaction being purulent does not affect the necessity for attending to the other factors mentioned in this connection under simple chronic inflammation

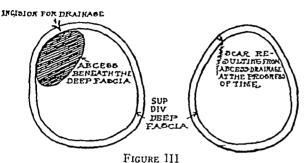

Determining the depth and direction of the sinus is important in locating the group to which the particular node belongs. And from the knowledge the X-ray may be applied as a stimulant to the abscess region. To expose a sinus to radium or X-ray and heal the outlet of a chronic discharging abscess is to put off trouble. This feature was noticeable in some of the early-cases. Sunlight and other forms of heliotherapy have this latter effect and are not advisable as local stimulants.

The second type presenting before opening are much easier to diagnose and treat, mainly because the focus of infection is still active and it can be found and treated or removed course of the abscess can be determined and an opening made at the proper time, thereby saving important structures, the skin and fat, and not opening before the node substance has become entirely destroyed Prolonged drainage is entirely unnecessary In the chronic pyogenic form, a drain of gauze inserted loosely for 48 hours and not replaced suffices. In the tuberculous type, an attempt is made by pressing the surrounding tissue to express through the opening all of the purulent material Force may be used as these abscesses contain no bacteria that will set up inflammation in the cellular tissue and if pus is extruded into the healthy tissue it is readily absorbed as the abscess cavities are sterile. No drain is inserted and the punctured wound collapses to drain no more. In some early patients, the drainage wound was opened again in a few days because of the apparent collection at the site of the abscess In every instance a blood clot was found to fill the abscess cavity and unless great care was observed these cases become secondarily infected and troublesome

A culture of the pus taken prevents a low grade progenic abscess from being mistaken for a cold abscess and if drain is indicated by the presence of pyogenic bacteria a second puncture through the original sinus can be done in 48 hours without an anesthetic and drainage inserted for 48 hours

When treated properly, infected nodes of the neck do not present a serious problem to the medical attendant during the infection nor is it one of any residual importance to one so affected. Cosmetic results count for more than the infection in every class of patient, except the acute purulent type, and in those as good cosmetic results can be obtained without increasing the danger to the patient of infection, if careful study of the early stage of the infection is observed by all those assuming responsibility of treatment.

done and in no way prevents entrance of infection into the general system while the original source is left open to admit infectious bacteria which have free access to the general circulation except for the sieve-like action of the node in checking their progress so that the proper forces of defense may have an opportunity to seek out and destroy the invading bodies

Purulent type—deep cervical abscess—rupture of capsule Resulting scar

Examination at this stage reveals a discreet tender mass varying in size still retaining the nodular shape and characteristics. Rupture of the abscess through the node capsule, with the formation of a cervical abscess, produces the usual symptoms in that the abscess is no longer discrete, the surrounding structures are edematous, infiltrated and fixed. Fluctuation becomes apparent from the skin surface at this stage and the depth of the purulent material which is always advancing toward the skin surface may be estimated.

Now there is an important local anatomical fact which must be taken into consideration at this point. All the cervical lymph nodes are situated beneath the superficial division of deep cervical fascia and the resulting scar depends very largely upon the ability of the surgeon to accurately estimate the approach of the advancing abscess to this fascia-opening for drainage before or when it has reached this fascia, depending upon the depth of the node The abscess will perforate the superficial division of deep cervical fascia and then become a superficial cervical abscess with all the other signs present and in addition redness and edema of the skin, and finally perforation and a spontaneous cure Drainage of this type of cervical abscess does not require wide incision and packing An incision 1/4 inch long made just through the skin permits a sharp nosed clamp to be plunged into the abscess cavity by piercing the intervening fat and superficial division deep cervical fascia If the knife is plunged through into the abscess cavity troublesome bleeding may occur from vein puncture, necessitating enlargement of incision to clamp the bleeding vessel Since confining the incision to the thickness of skin and

using a clamp to open into the abscess cavity there has not been sufficient bleeding in any case to require clamping a vessel. The vessels are pushed aside as the clamp passes through the superficial cervical structures. Introduction of a drain for 48 hours without attempt to express the purulent material more than will easily run out upon making the opening suffices to establish a sinus sufficient to drain out the material which has been completely broken down

Drains used are single wick gauze, which are soft and do not cause pressure with destruction of fat but are sufficient to establish a sinus through which the purulent material is all very quickly extruded by the movements of the muscles of the neck in turning and lifting the head. No further drains are inserted after 48 hours and there has not been an instance of secondary opening in a node of this type

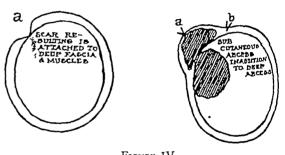

FIGURE IV
Superfic al cervical abscess Ruptured through the su
perfic al division of deep cervical fascia when opened at
a" leaves scar and depression

Multiple cervical abscess from more than one node of this group should not be confused with secondary drainage of the same abscess. It is at times possible to open an adjacent glandular abscess through the opening into the first abscess cavity after the first has been draining for a day or two, when the second can be mapped out as being directly adjacent. Plunging the clamp through the first sinus into the adjacent abscess, except in the region of the large blood vessels, has been done and the superficial scar formation further limited

Draining sinuses have remained for an average of fourteen days. Drainage longer than this in a small number of cases has been due to failure in removing a chronic source of infection, and in opening into a glandular abscess before the glandular substance has been entirely destroyed, which was followed by prolific granulation of the sinus.

Large incisions and packing with gauze as was formerly practised result in delayed healing of the sinus Unsightly skin scars with depressions from destruction of fat due to long drainage and ulceration of the fatty tissue

Scars resulting from this type of treatment are negligible and often have to be searched for

ence of hyperglycæmia—rather the reverse Furthermore, it is notorious that the value of insulin is decreased 50 to 75 per cent in the presence of infection and that once drainage is established the power of insulin rapidly returns, exactly

why, no one has yet explained

In addition to the four peritonitis cases above cited, there were two others that received immediate operation One died He was 66 years of age with an NPN of 73 10 and a blood sugar We did the proper thing and operated There was a localized abscess, immediately which was drained He was started with nitrousoxide and oxygen, but we were unable to hold him without ether This was in 1923 no insulin and the diet was not well regulated He died two weeks after the operation other case had a midnight operation last June Appendectomy with drainage was performed. The next day mild diabetes was discovered. This responded to treatment with recovery. Of six cases of suppurative peritonitis, four died (66 per cent) Cutler has found our nondiabetic death rate in suppurative peritonitis to be 105 per cent.

There were seventeen patients admitted with cellulitis, of which one died These all showed the phenomenon of an increase of sugar on a limited diet, and many showed acidosis typical case was Mrs McI from the Vanderbilt Clinic. She had lived on a diet of C65-P70-F120 with units 16, twice a day With this she was comfortable and showed no sugar or acetone The abscess on her thigh developed On the same diet and with the same amount of insulin, her blood sugar became .25 with a CO, of 4470 Sugar and acetone appeared in the urine Under local anaesthesia the abcess was incised and drained The next day the blood sugar had dropped to 19 with the same diet, and on discharge, eleven days later, the blood sugar was normal with the wound almost healed No change had been made in the diet or the insulin. It was an interesting demonstration of the diminution of the sugar tolerance with the entrance of suppuration Along the same line Dr Kirby Dwight⁸ demonstrated, in two cases, that in open infected wounds, the metabolism of sugar had an inverse ratio to the wound bacterial count under the Carrel-Dakin treatment

We also noted that the healing of these infected wounds was slower in the diabetic even though the blood sugar was reduced to normal and proper drainage had been secured All the abscess cases were discharged with the diabetes under control and the wounds healed or granulated

We next come to a much more serious problem—carbuncles We had eight, of which two died They averaged 57 years in age and had had the carbuncle for an average of eleven days on admission to the hospital. They were located on the back, the neck and the chin. The majority showed acetone on admission and the routine treatment was started. These patients are of particular interest for they should give as good results as carbuncles in the non-dia-

betic, under proper care.

Mr J W was a ten year diabetic of 68 years who came in with a two weeks history of infection and a carbuncle of the back, six inches in diameter His blood sugar was 38 with acetone and diacetic in the urine, and a blood CO2 of 4500 He received immediate crucial incision under nitrous oxide and oxygen was given a diet of C60-P-40-F80 with units ten, three times a day. The acetone disappeared the next day, but we had to run the insulin up to 70 units per day and the carbohydrate to 90 grams In spite of this the carbuncle extended and finally, ten days later the extension was excised His blood sugar then promptly dropped to normal and the insulin to 45 units per day On leaving the hospital five units three times a day were sufficient

Mr A. A., private patient, died four days after admission He had had the carbuncle for five days and the relationship to diabetes was not recognized until the morning after admis-He had been operated upon immediately under gas and ether, but the next day in spite of that, there was only sugar in the urine. He had an NPN of 11700, a CO2 of 44 and a blood sugar of .24 the day after the operation He was given 55 units of insulin and a fluid diet. The carbuncle extended and the second day after the first operation an enlargement of the incision was made under gas and oxygen The day after this he died. The mistakes were that he was given ether without having first tested the urine, and secondly, the procedure The other carbuncle was not radical enough who died two days after admission was not relieved by operation The carbuncle had involved the chin and there was a fulminating secondary involvement of the throat Seven cases were treated by surgery and one by x-ray therapy

GANGRENE-DIABETES WITH ARTERIOSCLEROSIS

Two cases of gangrene of the fingers presented themselves Both had moderate diabetes and both had mild infections. These cleared up after amputation of the finger associated with diabetic therapy. At no time did they cause any anxiety.

There were nineteen cases of gangrene of the toes. One of these never had operative procedure. He had lost one limb through amputation and did not want to lose the other Sixteen submitted to conservative surgery and only four were successful. Of the twelve failures, five went on and died without any more

DIABETES IN SURGERY*

By WILLIAM CRAWFORD WHITE, MD, NEW YORK, N Y

a million diabetics in this country. This must force us to realize that diabetes melhitus is of vital interest to all phases of the practice of medicine. After the discovery of insulin in 1921, it came gradually into intelligent use and slowly there has developed an appreciation of its value. As it is now seven years since the introduction of insulin aroused new interest in diabetes, I have thought it worth while to see what we have accomplished in the surgical cases with diabetes. This material comes from the surgical services of The Roosevelt Hospital, with the addition of three personal cases of leg amputation, from the Lincoln Hospital.

There are sixty-six (66) cases in this review and all have been in the hospital since the spring of 1923. Nineteen of these died, a mortality of 28 per cent. With this, compare the New York Hospital records of 40 per cent before the discovery of insulin and the recent record of 11 per cent, as reported by N. B. Foster and 14 per cent by D. P. Foster and E. C. Davison, after the use of insulin. For clinical reasons we may divide our patients into two groups, those of election, and those of necessity

There were only fifteen elective cases, a surprisingly small group when one considers the volume of work that is done each year. It makes me believe that physicians as a class are adverse to operative interference on their diabetic patients through fear of the consequences. The fact that the disease is most frequent over fifty years of age can not be a sufficient reason, as considerable surgery is performed on older people at the hospital

All these fifteen elective cases had major surgery For anaesthesia, three had nitrous oxide-oxygen, two, ethylene, nine, gas-oxygen-ether and one local The variety consisted of two herniæ, five radical mastectomies, one gastro-enterostomy with a secondary entero-enterostomy twelve days later, two suprapubic prostatectomies in one stage, one extensive laceration of the tendons, one exploratory celiotomy for carcinoma of the head of the pancreas, one supravaginal hysterectomy and one cholecystectomy. This is a good variety of surgery

All these patients were kept in the hospital a sufficient length of time to reduce their blood sugar to normal, find out their maintenance diet, and the necessity or otherwise of insulin. As we have learned more about insulin and diet this period has steadily lessened. The abdominal hysterectomy died

If a person should present himself now with an elective surgical problem (1) I would determine the feasibility of obtaining freedom from glycae-

the feasibility of obtaining freedom from glycae*Read before the Medical Society of the County of New York,
January 23, 1928

mia with or without the aid of insulin (2) The patients' general constitutional condition must be studied and appraised (3) The necessity of surgical interference must be judged. If it is felt that surgery is advisable and that the diabetes is under control, operation is more-freely indicated than formerly. The wounds should heal as well as other wounds and the recovery, under proper supervision, should be uneventful.

It is wise with such cases to take some special It is proper to feed them up well precautions with carbohydrates for a few days before, increasing the insulin so that the glycogen storage in the liver may be at its maximum. Then for anaesthesia, local infiltration with block, by novocame has first choice. Although we have not sufficient knowledge of spinal anaesthesia, many are very enthusiastic for its use, when possible, and give it first place. In Boston, it is now the routine for leg amputations For general anaesthesia, nitrous oxide and oxygen or ethylene are preferred, but we have had cases in which it has been necessary to add ether to obtain relaxation Ether itself increases the amount of sugar in the blood and, especially with the obese, produces

acidosis through diminution of blood oxidation

The urmary output is decreased so that the ex-

cretion of acetone bodies from the body is les-

sened, while the usual nausea and vomiting accentuates the acidosis and prevents the intake of

carbohydrates by mouth
Following an operation we now have a splendid help in glucose intravenous infusions. One may give the "Lily" preparation, with buffer, giving up to fifty grams and using one unit of insulin to two grams of glucose. Give this very slowly in saline and great improvement will be noted. In certain kidney conditions it may be advisable to avoid saline. We have used the glucose infusions in both diabetics and non-diabetics after operation with good results. We have not used sodium bicarbonate and in view of Dr. W. P. Healy's results in gynæcology after the free use of sodium bicarbonate, we are less anxious than

ever to try it Some years ago the notion became prevalent that the diabetes should receive immediate treatment in cases of necessity and the operative interference should be deferred until the acidosis and the hyperglycæmia were brought under control Following this idea, four suppurative peritonitis The acidocases were so treated and three died sis was cleared up, but the patient died We have at Roosevelt made the practice of immediate surgery in acute peritonitis cases in non-diabetics To that we ascribe our good results Now bacteria with sugar in the peritoneal cavity should grow ever so much faster, and from that point of view it does not seem reasonable to suddenly abandon routine operative procedure in the presence of hyperglycæmia—rather the reverse Furthermore, it is notorious that the value of insulin is decreased 50 to 75 per cent in the presence of infection and that once drainage is established the power of insulin rapidly returns, exactly

why, no one has yet explained

In addition to the four peritonitis cases above cited, there were two others that received immediate operation One died He was 66 years of age with an NPN of 73 10 and a blood sugar We did the proper thing and operated immediately There was a localized abscess, which was drained He was started with nitrousoxide and oxygen, but we were unable to hold him without ether This was in 1923 no insulin and the diet was not well regulated He died two weeks after the operation other case had a midnight operation last June Appendectomy with drainage was performed. The next day mild diabetes was discovered This responded to treatment with recovery Of six cases of suppurative peritonitis, four died (66 per cent) Cutler has found our nondiabetic death rate in suppurative peritonitis to be 105 per cent

There were seventeen patients admitted with cellulitis, of which one died These all showed the phenomenon of an increase of sugar on a limited diet, and many showed acidosis typical case was Mrs McI from the Vanderbilt She had lived on a diet of C65-P70-Clinic F120 with units 16, twice a day With this she was comfortable and showed no sugar or acetone The abscess on her thigh developed On the same diet and with the same amount of insulin, her blood sugar became .25 with a CO, of 4470 Sugar and acetone appeared in the urine Under local anaesthesia the abcess was incised and drained. The next day the blood sugar had dropped to 19 with the same diet, and on discharge, eleven days later, the blood sugar was normal with the wound almost healed No change had been made in the diet or the insulin It was an interesting demonstration of the diminution of the sugar tolerance with the entrance of suppuration Along the same line Dr Kirby Dwights demonstrated, in two cases, that in open infected wounds, the metabolism of sugar had an inverse ratio to the wound bacterial count under the Carrel-Dakin treatment

We also noted that the healing of these infected wounds was slower in the diabetic even though the blood sugar was reduced to normal and proper drainage had been secured All the abscess cases were discharged with the diabetes under control and the wounds healed or granulated

We next come to a much more serious problem—carbuncles We had eight, of which two died They averaged 57 years in age and had had the carbuncle for an average of eleven days on admission to the hospital They were located on the back, the neck and the chin The majority showed acetone on admission and the routine treatment was started. These patients are of particular interest for they should give as good results as carbuncles in the non-diabetic, under proper care.

Mr J W was a ten year diabetic of 68 years who came in with a two weeks history of infection and a carbuncle of the back, six inches in diameter His blood sugar was 38 with acetone and diacetic in the urine, and a blood CO, of 4500 He received immediate crucial incision under nitrous oxide and oxygen was given a diet of C60-P-40-F80 with units The acetone disapten, three times a day peared the next day, but we had to run the insulin up to 70 units per day and the carbo-hydrate to 90 grams In spite of this the carbuncle extended and finally, ten days later the extension was excised. His blood sugar then promptly dropped to normal and the insulin to 45 units per day On leaving the hospital five units three times a day were sufficient

Mr A. A, private patient, died four days after admission He had had the carbuncle for five days and the relationship to diabetes was not recognized until the morning after admission He had been operated upon immediately under gas and ether, but the next day in spite of that, there was only sugar in the urine. He had an NPN of 11700, a CO. of 44 and a blood sugar of .24 the day after the operation He was given 55 units of insulin and a fluid The carbuncle extended and the second day after the first operation an enlargement of the incision was made under gas and oxygen The day after this he died The mistakes were that he was given ether without having first tested the urine, and secondly, the procedure was not radical enough. The other carbuncle who died two days after admission was not The carbuncle had relieved by operation involved the chin and there was a fulminating secondary involvement of the throat Seven cases were treated by surgery and one by x-ray therapy

GANGRENE-DIABETES WITH ARTERIOSCLEROSIS

Two cases of gangrene of the fingers presented themselves Both had moderate diabetes and both had mild infections. These cleared up after amputation of the finger associated with diabetic therapy. At no time did they cause any anxiety.

There were nineteen cases of gangrene of the toes. One of these never had operative procedure. He had lost one limb through amputation and did not want to lose the other Sixteen submitted to conservative surgery and only four were successful. Of the twelve failures, five went on and died without any more

surgery Seven had secondary leg or thigh amputations and of these seven, four died Two cases had radical amputation—both much delayed—one lived and one died So that with foot gangrene and no surgery, all died, with surgery, four out of nine died

To repeat, only 25 per cent of the toe amputations were successful and only 44 per cent of the leg or thigh amputations

Joslin 1 makes no analysis of toe amputations, but speaks of a large group of leg amputations, 56 cases with 73 per cent success. Our more conservative methods of toe amputation gave only 25 per cent success, and pushing this up with the secondary radicals and the two primary radicals, we had only eight out of eighteen, successful operative procedure—44 per cent as compared to Joslin's 73 per cent

When I was an interne, Dr L W Hotchkiss preached high amputation, but under the influence of his colleagues on the staff, we thought him too radical Now, even with the advent of insulin his advice holds good today, if we are to judge from our results I firmly believe that more radical surgery and that done with promptness would have given us happier results Pathologically, in infected gangrenes, the lymphatics of the leg are filled with bacteria and the chances of a clean result with leg amputation are slight, with a thigh amputation it is good and such is most desirable in diabetes

You will say, are there not dry gangrenes that survive without radical surgery? Every one can recall such a case I will grant that there are a few But when you do such surgery, recognize that at best you succeed in only a small number of cases and that you must be prepared and have the patient prepared, at the least sign of wetness or extension, to go ahead and do a high amputation Only one of our cases was an honest to goodness dry gangrene and remained so

Dr Joslin supports this Of his deaths he said, "All these cases died within a few days of operation because operation was performed too late" To reduce mortality from septicaemia we must (A) prevent lesions of the feet and (B) if they occur (1) educate the patient to report them at once, (2) reach an earlier decision when to (3) perform a more radical procedure and (4) build up more energetically the vitality of the patient by dietetic and other means

To prevent gangrene, one must give early attention to numbness and cyanosis of the toes, Buerger exercises, frequent cleansing of the feet, proper socks and shoes As an example, remember that the Japanese who seem prone to arteriosclerosis and diabetes, rarely have gangrene Their physicians think that it is due

to the heavy comfortable socks and the loose sandals that they wear. Then if an infection appears, call in a surgeon and cooperate. Continue the foot exercises, give Alpine light, "Dakinize" the wound and keep the patient in bed. Perhaps many may be protected from gangrene. It it becomes more extensive, remember our results and be radical.

SUMMARY

- (1) Elective operations in diabetes now should have but little more risk than in a similar group of the same age
- (2) Abscess cases with diabetes require more care than with the non-diabetic
- (3) Carbuncle is a serious complication in any condition, especially in diabetes. The best procedure is excision of the carbuncle with vigorous diabetic therapy. The crucial incision does not rid the body fast enough of the large amount of slough—the very material to inhibit diabetic control.
- (4) Acute infectious cases require immediate surgical interference. Diabetic therapy should be instituted at the same time, but not take priority
- (5) In gangrene we have been too conservative In the lower extremity we tried it out and were only 25 per cent successful. Then when the infection and the septicaemia had appeared we tried out higher amputation. Only four out of nine attempts were successful. Only eight out of eighteen operative cases left the hospital alive—44 per cent. This compares badly with Joslin's 73 per cent, and points only one way. Unless radical operation is decided upon and with speed, our records will continue to be poor, though we make a pin cushion of the patient with insulin injections.
- (6) There should be an administrative change on the part of the hospital staffs. Men interested in the subject should be assigned to a special diabetic service on which both physicians and surgeons make daily visits. In this way our results will improve

THE DOCTOR AND HEALTH ACTIVITIES* By LINSLY R WILLIAMS, MD, NEW YORK, N Y

URATIVE and preventive medicine is practised by physicians. Medical schools have stressed the teaching of curative medicine and have paid but little attention to the subjects of preventive medicine and public health until the last five years.

The practicing physician has thought, and to a large extent even now thinks in terms of cura-

tive medicine

The proposals for the application of our newer knowledge of the prevention of disease and the maintenance of health to the general public have come very largely from health departments and voluntary health agencies

The various new health activities which have been proposed by health agencies, official and voluntary, have been originated largely by physi-

cians, occasionally by laymen

The application of these procedures resulted in the partial socialization of medicine which has two principal objects, first, bringing competent medical service to those who do not now have it, and second, diminishing the present cost of such service

The aims of physicians and their representative organized groups, the county medical societies, the voluntary health agencies, and the health departments, all have the same fundamental purpose of increasing the amount of preventive and curative medicine. All of these groups earnestly desire to increase the quantity and improve the quality of preventive and curative practice. There are, however, fundamental differences of opinion as to the method by which these aims and objectives can be accomplished.

Many physicians and the organized medical societies, private and incorporated, have a definite fear of what is called by them "state medicine" By state medicine they mean that the state shall provide at its expense all the facilities for preventive and curative medicine and employ and supervise the work of all the physicians, and they point with some disdain at the systems of social insurance which exist in Germany and England There are others who say "State Medicine refers to the extension of governmental activity in the health field, by creating compulsory health insurance or free and pay clinics, or distributing physicians, or seeking complete control of medical practice as a public utility" State medicine, however, does not exist in either Germany or England and the so called panel system in England provides only a minimum type of medical service for the working population and employs about one-third of the physicians in the country, but unfortunately the more energetic and ambitious physicians do not take part in the insurance scheme

In the state of New York, there has been a great deal of progression toward the socialization of medicine which term is preferred to the whoesale practice of medicine and is exemplified by industrial medicine, operation of the Workmen's Compensation Act, pay clinics and expansion of Health Department activities

No one knows how many people in the city and state of New York are unable to obtain medical treatment, nor does any one know how many are either unable or unwilling to obtain preventive treatment. It is known, however that there are many persons who are unwilling to secure preventive treatment unless it is given them free

of charge

In the schools of New York City there are detected annually about two hundred thousand children who are affected with some type of disease or physical defect and the Health Department's reports show that approximately half of the children are placed under some kind of treat-From a review of the reports of the Health Department, one gains the impression that although 50 per cent are placed under treatment, this treatment is far from adequate or satisfactory to either patient or physician Voluntary health and social welfare agencies seek to obtain treatment not only for this group of children but for all others who do not frequently seek medical advice, and physicians as individuals feel themselves powerless to do anything as by the ethics of their profession they are not permitted to advertise, nor are they considered wholly ethical if they seek new business by commercial methods Naturally, the physician feels hurt when patients who can well afford to pay either his full fee or a reduced fee are persuaded to secure medical advice at hospital or dispensary free of charge.

Health and social workers feel the deepest concern for the needs of the individual, and seek to obtain preventive and curative treatment for him and occasionally without considering whether or not the individual can afford to pay

We are interested primarily in furthering preventive treatment, and physicians are deeply and sincerely interested in improving public health and contribute in no small measure of their time and money to this end

Many projects and activities launched by health departments or by voluntary health agencies are determined by committees consisting of lay and medical members with considerable discussion often with representatives of the medical profession, but reach only a relatively small number of the medical profession before the project is definitely undertaken. The activity is heralded in the press and the average practicing doctor learns of it for the first time from his newspaper. Human nature exists in physicians as well as in other classes of society, and the doctor naturally reacts

^{*} Delivered before the Third Health Conference at the Hotel Piltmore New York February 24 1928

in opposition to projects in regard to which he has not been consulted. Only too commonly the doctor learns that the executive councils of his medical society know nothing of the matter although the voluntary agency or health department may say, "We consulted the President of the Society who was entirely in favor of the project." The voluntary agency forgets that the President of the Society can no more speak with authority for his society than can the Governor of the State on a project which has not been adopted by the legislature

It is most strongly urged that social welfare agencies which are engaged in any type of health activity and voluntary health agencies see to it that they have upon their boards official delegates of the county medical societies who are selected officially by the county society and who can keep the county medical societies officially informed on the nature of every new project. The voluntary association may also obtain advice and counsel of the organized medical body before undertaking a new activity. Such procedures will bring to the county society an opportunity to discuss health

activities during their formative stage and will give to the medical profession an opportunity of taking a greater interest in public health activities and in taking the leadership in the promotion of public health work and place it in the position which it should have of advising and counseling lay organizations in regard to the health activities which they should maintain

The problem then consists of how society can continue to increase the practice of curative medicine and to improve its quality, and second, how society can provide for the care of those individuals who need both preventive and curative medicine but do not now receive it because they are either indigent or unwilling to pay the price perhaps justly demanded by physicians. The answer to this second question demands the thought and action of all medical bodies, and if organized medicine does not point the way to a solution of these problems, the much feared State Medicine may become a reality, in the establishment of compulsory health insurance for the larger part of our industrial population

EYE INJURIES

By L L ALBERT, M D., YONKERS, N Y

YE injuries may be classified as penetrating and non-penetrating. Non-penetrating injuries are necessarily confined to the conjunctiva, the cornea, and the sclera. Any eye injury may develop manifold complications, depending on the degree of injury. An estimation of the degree of injury includes the problem of possible penetration and resulting infection.

In very slight injuries, as those due to foreign bodies on the cornea, erosions of the corneal epithelium, etc., the eye may become severely inflamed. Due to irritation of the trigeminal nerve fibers, an active hyperemia of the ciliary vessels is rapidly produced. Reflex reaction may cause excessive lachrymation and the entire picture is easily mistaken for a simple acute conjunctivitis

If the foreign body is a bit of iron, it is readily disintegrated into iron salts which cause severe corneal reactions. The bed of the foreign body is stained brown by the hydrated oxide of iron. Leucocytes proceed from the superficial capillary vessels at the limbus and form a ring of protective infiltration around the pigmented area in an attempt to expel the necrosed corneal cells. In the removal of a foreign body consisting of iron, therefore, it is necessary to remove also all the surrounding brownish-red pigmentation which in itself may continue to act as a foreign body irritant.

Severe non-penetrating injuries may give rise to inflammation even without infection or necrosis They produce deep corneal infiltrations at some interval after the injury. These deep corneal infiltrations may stimulate corneal abscesses. They are caused by circumscribed necroses of the deep corneal layers forming sequestra leading to well defined local inflammations. White corpuscles come from the deeply situated ciliary vessels and produce corneal opacities. These types of inflammation last a long time and often will leave behind dense scars.

A similar local necrosis in the iris causes alomst no inflammatory reaction. In cases of extensive iridodialyses, a large portion of the torn-off iris is often necrotic. Nevertheless no suppuration occurs and the eye inflammation subsides after resorption of the hemorrhage Clinically the necrosis is recognized by light or gray and sometimes spotted discoloration of the iris. Later these areas appear poor in cellular elements, as if empty, with definitely preserved outlines

The retina and choroid react differently to a local aseptic necrosis such as occurs after a severe, non-penetrating injury. Histologically these structures appear homogeneous. Their nuclei are not easy to stain and the structure and pigmentation of the choroid appear blurred, often as if dirty. Leucocytes appear late and the necrotic tissue is replaced by a thin fibrous membrane. The pigment forms local proliferations. Clinically these areas appear as white spots which are pigmented.

around their margins. The same cause, therefore, has a wholly different effect on different

parts of the eye anatomy

In a perforating injury, if no infection appears and the lens is not injured, good vision may be retained. For the later fate of the eye, the location of the injury is extremely important. Thus, injuries to the sclera, in the region of the ciliary body, are extremely dangerous, because frequently, even years afterward, a detachment of the retina may occur and put an end to vision. This detachment is caused by the formation of fine connective-tissue-like stratifications from the inner surface of the ciliary body to the oral part of the retina. The ensuing contraction of this scar tissue pulls the retina away from the choroid

Most inflammations of the eye arise because of the fact that micro-organisms are brought into the eye. The virulence of the inflammation depends on the type and number of bacteria introduced as well as upon the site of injury. Mould fungi produce a very slight reaction while pneumococci, streptococci, etc., start a virulent reaction.

A foreign body in the interior of the eye is of greatest importance as regards prognosis. Foreign bodies are for the most part infected and, therefore, the earliest possible extraction is urgently indicated. Again, many foreign bodies on account of their chemical composition are not tolerated in the eye and cause chronic inflammation. Their decomposition products affect the retina chiefly, causing atrophy and blindness. Iron particles especially cause a brownish discoloration of the iris, a brownish cataract and a gradual loss of vision.

Perforation may be into the anterior chamber only, with infection usually limited to this region. In some cases, however, the vitreous is also infected. If in the anterior chamber only, a purulent iritis with hypopyon and greenish discoloration of the iris follows. Pus covers the anterior capsule of the lens and the pupillary margin becomes attached to the lens by a fibrinous exudate. The eye often over comes such an infection. The discoloration and hyperemia of the iris disappear, the hypopyon absorbs, but a gray membrane remains over the lens. The coloboma of an iridectomy will give a small amount of vision in such cases.

The lens, like the vitreous humour, offers a particularly good nutrient medium for bacteria, because due to an absence of blood vessels there is a lack of all protective bodies of the blood and cellular tissues

If the vitreous becomes infected, no inflammation appears immediately because the toxic substances of the bacteria cannot act directly on the blood vessels. Only when the toxins have diffused thru the vitreous and act on its membrane does the inflammation start. The vessels of the ciliary body and retina dilate, allowing the pus corpuscles to migrate to the bacterial focus where they form an abscess. Pus is seen on the surface of the retina. The optic nerve, attacked thru the lymph spaces, shows a neuritis. The choroid, protected by the retina, is spared.

The above pathological picture may show all gradations from a vitreous humour abscess to a general pan-opthalmitis. When virulent bacteria are present in the retina blindness ensues rapidly. Usually, however, light perception and projection are present for a long time after the injury. Unless detachment of the retina occurs as a result of retracting scar tissue bands, light perception may persist indefinitely

Sympathetic opthalmitis is almost always due to an irido-cyclitis resulting from a perforating injury of the other eye. It occurs most frequently in children, but may be met with at any age. The traumatized eye is known as the exciting eye and the one secondarily involved is known as the sympathizing eye.

Inflammation after an injury is not alway purulent. In rare cases, deposits on the posterior corneal wall appear some time after the injury. A severe irritis begins, but no hypopyon. Fibrin forms the starting point of a pupillary membrane and membranes in front of and behind the iris. In chronic inflammations, the inflammatory cells dissolve and the iris atrophies into a thin membrane.

In cases where a sympathetic inflammation starts in the uninjured eye, we find histologically a nodular infiltration of varying degree affecting the uveal tract only. These nodules form thick cell discs which may become confluent and cover the inner surface of the ciliary body below the non-pigmented epithelium. Because of this proliferation, the eye gradually becomes atrophic, having previously become blind from the pupillary membrane, the opacities of the vitreous and the complicating cataract.

We learn that all eye injuries are potentially serious, often leading to blindness. It is of the utmost importance, therefore, to give them the most competent treatment available. Here, one can truly say, is a favorable objective for the application of the ounce of prevention motto

RECORD OF THE ANNUAL MEETING

The annual meeting of the Medical Society of the State of New York, like that of any other great organization, will be held in triplicate

The first meeting is the ideal one that exists in the minds of the officers and committees on arrangements, and whose record is found in this JOURNAL, beginning on page 444

The second meeting will the physical one which

will actually unfold itself from the 21st to the 24th of May, a record of which will appear in our issue of June 1st

The third meeting will be that which will exist in the memories of the members, the records of the Society, and the pages of this Journal throughout the coming year Every effort will be made to make these three meetings identical

THE PRACTICE OF PREVENTIVE MEDICINE

The practice of medicine undergoes a continual readjustment. The stream of discoveries and the evolution of social methods require that every health agency,—professional, official, or voluntary,—shall adapt its methods to new conditions as they arise.

Preventive medicine is a new science and the art of its practice is in a state of development. It had its birth in contagious disease prevention by governmental departments of health, and it grew under the nourishing care of voluntary agencies, which adopted it as their pet child

Forward movements in the practice of medicine have usually been the result of research, experiment, and demonstrations under the auspices of organizations other than those supported It has never been by the money of physicians the policy of the official organizations of physicians,—the medical societies of the counties, the states, and the nation,—to conduct research work and demonstrations, because public sentiment and the decisions of courts restrain physicians in private practice from making experiments on patients and conducting novel demonstrations The decisions of law courts are that a physician must conduct his practice according to the standards set by his confreres The physician acts at his own peril when he performs daring operations and starts health demonstrations along new lines On the other hand, the physician acts equally at his own peril if he fails to make use of modern methods of diagnosis and treatment which research workers have proved to be valuable and have made the standard of action

When the practice of preventive medicine was in a developmental stage, physicians generally hesitated to ride the crest of the latest wave of alleged progress, for many public health waves have dashed themselves upon the shores of time and experience, and have flowed back into the sea of oblivion, to be followed by other alluring waves. But the tide of progress has now risen to such a height that physicians can convey their patients in the life boats of medical practice over the bars and shoals on which they were formerly in danger of capsizing

The period of experimentation and demonstration has now passed, and physicians are ready to adopt the methods of preventive medicine which research workers have developed and voluntary organizations have proved practical. These methods are essentially the same as those of curative medicine.

The modern practice of curative medicine requires the cooperation of a trinity of workers 1, physicians, 2, hospitals, and 3, nurses. The physicians come first, and the hospitals and nurses are their essential aids.

Hospital and nursing activities are conducted principally by non medical groups, and their object is to enable physicians to carry on their life-

saving work Yet it is no unknown experience that hospital managers have sometimes dictated the methods of physicians, and that nurses have engaged in activities which require the knowledge and experience that only the doctors possess

The modern practice of preventive medicine also requires the cooperation of a trinity of health workers,—1, the practicing physicians, 2, the official departments of health, and 3, the voluntary health organizations At one time it seemed as if the health departments and the voluntary agencies would assume the field of preventive medicine to the exclusion of physicians in private practice. State medicine and health centers were gravely urged upon legislators as the measures by which the benefit of preventive medicine would be forced upon a public which was unprepared But out of the turmoil of for the innovation conflicting plans there has come the realization that physicians in private practice form the dominating group in preventive medicine as they do in the practice of curative medicine

The practice of preventive medicine consists essentially in the diagnosis and treatment of diseases in their preclinical stage,—that is, before they have become disabling. The people generally have not yet reached the stage of knowledge and emotion in which they call a doctor out of bed at night to tell them how to avoid catching scarlet fever. Hence there is need for departments of health with their police power of compulsory obedience to health rules, and for lay organizations with their educative methods. One great object of health departments and voluntary health organizations is to send patients to their physicians in order to get the benefits of preventive medicine.

The last five years have seen the development among physicians of the realization of their duty to give to the public all needed service in preventive medicine. Nearly every county medical society in New York State has taken formal steps to promote the practice of public health along some important lines. The state-wide antidiphtheria campaign is evidence of the new desire of physicians that they shall assume the leadership in public health practice as well as in that of curative medicine.

While physicians are largely dependent on non-medical organizations, such as hospitals and nurses, for the practice of medicine, still more are they dependent upon governmental agencies and voluntary health organizations for the practice of public health and preventive medicine. A doctor cannot practice preventive medicine unless patients come to him. He cannot go into the byways and hedges and compel unwilling patients to partake of his health feast. The great field of work of voluntary health agencies is to inspire and educate the people to seek a doctor for preventive advice as eagerly as patients with a pain

seek a physician for relief The physicians will gladly see that preventive medical advice is given to patients who come or are brought to them, just as they take pride in giving medical and surgical treatment to patients in the free wards of the hospital. It is the work of social and relief agencies to bring the poor patients to the hospital, pay their hospital charges, and look after them during convalescence

This same principle applies to the practice of preventive medicine. The doctor is the judge

of the preventive medical attention which a patient needs, of the practical usefulness of the remedial measures that are proposed, and of the desirability and adaptability of a public health program. Voluntary health organizations will achieve their fullest measure of success when they leave the decision of all medical questions to the medical profession.

Physicians believe in the unity of the practice of all forms of medicine, from performing amputations, to giving prenatal advice in clinics

MEASLES-DEATHS

A circular letter dated April 5 sent to physicians by Dr E S Godfrey, Jr, Director of the Division of Communicable Diseases, New York State Department of Health, calls attention to certain fundamental facts regarding measles. It would seem that physicians would know about all there is to know about measles, and yet their practice indicates the need of more instruction regarding the disease. Probably the need to bear the known facts in mind is greater than that for instruction. Inspiration as well as instruction is needed.

Dr Godfrey investigated epidemics in two cities, each of over 100,000 population, and over 6,000 cases were discovered in 3,500 families He says

"One third of the discovered families, and one-half of the discovered cases had never been reported in either epidemic, and only forty per cent of the families were reported within a week after the onset of the first case in the family"

The responsibility for failure to report cases rests on the people even more than the doctors, but the responsibility for teaching the people rests on the physicians

Dr Godfrey brings out the fact that the death rate for measles is especially high among three groups of children. I, those in institutions, 2, those under three years of age, and 3, those not receiving proper hygienic care

Intensive work has been done in the children's institutions of New York State with the result that while the death rate among cases of children under five years of age was 113 per cent in 1923, it was 19 per cent in 1926. There was little or no reduction in the incidence of cases. The fall in death rate was due

to proper care of the patients from the days of onset What has been done in institutions can be done in private practice

Regarding the fatality rate in its relation to age, Dr Godfrey shows that whereas 13 30 per cent of all cases were in children less than three years old, 67 33 per cent of all deaths occurred in that group. This means that the death rate among children under three years of age is five times that of other persons. The lesson is obvious—keep the babies away from cases of measles.

Regarding the care of patients afflicted with measles, Dr Godfrey emphasizes the need of hygienic measures such as any family can carry out Measles begins like a common cold, with no characteristic symptoms until the eruption appears on the fourth or fifth day, and during the pre-eruptive stage the patients go around the streets and to school and not only infect others, but also commit hygienic sins which result in pneumonia, ear diseases, and other "It is only a cold" is a likely complications diagnosis of both the doctors and the parents Public sentiment is not favorable to the control of children with "Colds," until the infections are proven to be measles or scarlet fever or other disease to which an old name may be attached

Dr Godfrey also discusses the passive immunization of children with serum from convalescent cases. He states that the State Department of Health has a small amount of serum available for children under three years of age and for delicate older children who have been exposed to the disease

The control of measles is a public health problem whose solution lies principally with family physicians

THE WOMAN'S AUXILIARY

Woman's Auxiliaries of the state medical societies have been organized in many states of the Union and similar auxiliaries have been formed in many of the constituent county medical societies. Those eligible to membership are the ladies

of the immediate families of the physicians Many journals of the state societies have departments containing news of the auxiliaries

Many activities are conducted by the Woman's Auxiliaries The ladies attend the meetings of

the physicians' societies and help in entertaining the doctors, thereby promoting acquaintances

among the medical men

A favorite activity is medical education. New Jersey employs a lady lecturer who addresses women's clubs on medical matters. Many auxiliaries secure subscriptions to Hygeia. The Woman's Auxiliary of South Carolina is raising money.

for a memorial to Dr J Marion Sims, the father of modern gynecology

The House of Delegates of the Medical Society of the State of New York took action at its last meeting to form a Woman's Auxiliary

An outline of possible activities of the Auxiliary by the Vice-President of the National organ will be found on page 468

LOOKING BACKWARD

THIS JOURNAL TWENTY YEARS AGO

Treating Well People

This Journal for April, 1908, contains an editorial on the treatment of well people, which prophesied many things which are now coming

to pass The editorial says.

The necessity for the family physician and the practitioner of medicine will always exist Even as the infective diseases become less and less, there will ever be human ills and accidents, not the least of which are birth and old age with their manifold symptoms. It is not difficult to believe, and surely is reasonable to hope, that the practitioner of the future will share in the general tendency of the times, and in his relation to the individual and the family will be of greatest service in preventing It is earnestly to be wished that future medical education will give attention to the study of the simple things now neglected —the general care of the health of the healthy individual We have been so busy with diseases and the sick that we have neglected the well

"Are coarse foods of value in preserving health? Is it true that 'four hours of sleep before midnight are worth six after midnight'? Do we really eat too much, or is the cry but a bugaboo? Is fresh air so necessary for health and conducive to longevity? Is the minimum of proteid food the optimum? Is hypermastication of value? Is a daily bath of hygienic virtue? Is it really beneficial to take a cold morning bath? Is exercise essential to perfect health? It is to such simple questions as these that we need to give a scien-

tific answer, and place our knowledge of them on a sure footing. At present they are answered by some in the affirmative, by some in the negative These are the questions which concern the well, not the sick, and I shall always insist that, of the two, the well man is of the greater importance and more entitled to the consideration of science

"If as much money and enterprise as have been bestowed upon hospitals were devoted to preventing the diseases which are treated in hospitals, the hospitals would be much less important figures than they are at present Here lies a woman with her lower abdomen full of pus, intestines matted together, an operation scheduled for tomorrow morning, and eternal invalidism for the rest of her life. A pamphlet costing less than twenty-five cents in the hands of her husband at the proper time, or the proper instruction from a respected source, would have saved all of this

"Some day we shall have scientific studies of human health Papers before societies on these subjects will be common Every medical school will teach hygiene (not merely have a nominal chair, rarely sat in) and the study of health will be regarded as of greater value than the study of disease This most important scientific field yet remains practically undeveloped Biologists are needed to study man to the utmost possibilities of human knowledge

"As the family doctor makes himself efficient he will become the family hygienic councillor, and in that capacity his usefulness and

influence will multiply"

MEDICAL PROGRESS

Some Problems in the Etiology of Cardiac Failure - Sir John F J Broadbent, writing in the Lancet of February 4, 1928 (ccxiv, 5449), discusses the factors that may contribute to the production of heart failure under three headingsvalvular disease, affections of the myocardium, and disorders of rhythm A consideration of the changes incident to valvular disease makes it obvious that these, when severe, may be an important contributing factor to heart failure Affections of the myocardium are more important and more difficult to estimate Here the functions of tonicity, contractility, conductivity, and the power to respond to stimulation must be con-Impairment of the function of tonicity is the main etiological factor in dilatation of the Its causes are bacterial toxins of all kinds. especially the rheumatic affections of childhood, and also Graves' disease, chronic alcoholism, and various debilitating influences such as nervous strain and poor nutrition Contractility is the most vital and essential property which enables the heart to fulfill its function of propelling blood into the circulation, and the chief symptom of its failure is the clinical symptom known as angina The most serious pathological lesions, pectoris entailing grave and permanent impairment of contractility, are lesions of the coronary arteries or their orifices interfering with the blood supply to the heart muscle, and of these syphilitic lesions are the most fatal Causes other than the cutting off of the blood supply may impair contractility, for instance fatty or fibroid degeneration of the heart muscle, which when advanced may be almost as serious, and cases of sudden death are not uncommon with these conditions There may, however, be minor degrees of impairment of contractility associated with precordial pain on exer tion, due to depression of a temporary nature from which recovery is possible Disorders of rhythm, though they may cause considerable discomfort to the patient, do not in the majority of cases play a predominant part in bringing about heart failure, though they may contribute to it The more severe types of heart block, due to compression of the fibers of the bundle of His by inflammatory exudate or cicatricial tissue, are of more serious prognosis. Prolonged or frequent attacks of auricular flutter or paroxysmal tachycardia may exhaust the contractility of the heart muscle and lead to a fatal issue Auricular fibrillation is a serious handicap if associated with a valvular lesion, but in the absence of such lesion it may persist for many years without giving rise to any serious symptoms or even inconvenience In a given case it is not sufficient to make a diagnosis of valvular disease or cardiac dilatation, etc, but one must obtain some definite idea as to the

relative importance of the factors which may contribute to a cardiac breakdown

Nitroglycerin. — Louis Faugères Bishop, writing in the Medical Review of Reviews, February, 1928, xxxiv, 32, outlines certain information which the doctor should give the patient concerning the use of nitroglycerin This drug, which is a valuable symptomatic remedy in various untoward symptoms arising from a diseased cardiovascular system, unless used properly, is often mert or dangerous. It is better to give small doses frequently rather than one large dose About 1/225 of a grain at a time is the proper amount, this can be repeated every fifteen minutes until relief 15 obtained The patient should be told that nitroglycerin pellets should be chewed in the mouth and not swallowed, because the action of the drug is much better when absorbed by the buccal mucosa He should be instructed that nitroglycerin tablets obtained from a druggist are often mert Physicians should obtain a freshly made supply for their own use from time to time. The doctor should never forget to tell the patient that a dose of nitroglycerin may cause a transitory headache and a sense of fulness in the head due to the fact that there is more blood stasis in the brain while the drug is acting, due to its vasodilating effects, and the headache is no contraindication to its use

Hemolytic Streptococci in Miscellaneous Throats - Professor Bürgers of the Königsberg Hygienic Institute has for many years past studied smears from the throats of the sick and well, and among the flora the hemolytic streptococcus has been present in great fre-A request broadcast to colleagues quency for smears with clinical diagnosis appended has brought in additional material, so that the author can tabulate 300 cases in which some In 134 of these kind of angina was present streptococcus cases the clinical diagnosis was follicular tonsillitis, in 60 it was clinical diphtheria (without Klebs-Loeffler bacilli), in 35 there was merely transient redness and swelling of the tonsils, and in 34 scarlet fever The remainder were divided among quinsy, diphtheria with bacteriological confirmation, Plaut-Vincent angina, etc In over half the cases there was nothing to suggest contagion, including chiefly follicular tonsillitis and quinsy In only a few straggling cases had these patients been exposed to a known contagious angina On the other hand, weather influences

were manifest, the incidence increasing with the cold months These finds do not indicate any marked pathogenic activity of the hemolytic streptococcus as such but rather that this organism is only a chance find, but to-accept such a view as final is hasty and ill-advised, for healthy children out of school seldom show this organism in the throat, although after they begin to attend school it is seen with increasing frequency Moreover it is evident that there are several different pathogenic strains of these cocci, and we are unable to determine whether a single one or several are able to cause scarlet fever, or whether avirulent forms can become virulent under unknown circumstances It can only be claimed that the mere finding of hemolytic streptococci in the throat is without much significance -Klimsche Wochenschrift, February 12, 1928

Treatment of Malignant Diphtheria With Ordinary and Streptococcus Antitoxin.—Articles on this subject by F Meyer, bacteriologist, and H Finkelstein and E Konigsberger, pediatricians, are in reference to the recent appearance of a type of malignant diphtheria in Berlin which is refractory to ordinary diptheritic The conclusions of Meyer are as follows Bacteriological study of this malignant diphtheria having shown that large numbers of hemolytic streptococci are present in at least half the cases, along with the fact that these organisms produce a toxin which causes lesions analogous to those of the diphtheria toxin-which in turn can give rise in the body to a special antitoxin—it is urgently indicated to manufacture this antitoxin and inject it jointly with the original antitoxin of Behring It has been shown that the new remedy is safe for the patient. Further than this Professor Meyer does not go, the clinical side of the subject being stated by Finkelstein and his colleague These authors state explicitly that the new antitoxin and the combined antitoxins are to be used only in this particular expression of malignant diphtheria. They have made the injections at once without tarrying for a bacteriological diagnosis, this naturally including cases in which no streptococci were The first series of chilsubsequently found dren treated numbered 9 of whom 2 died, but this ratio was unfortunately not maintained, for even under the combined treatment the mortality of the toxic patients reached 44 per-This was an improvement on the early mortality of 87 per cent, but too high to warrant a characterization of the treatment as successful - Deutsche medizinische Wochenschrift, February 10, 1928

The Pathogenic Action of Bartonella Muris and Its Resemblance to Bartonella Bacilli-

forms of Carrión's Disease -In the course of experiments undertaken with the purpose of studying the influence of splenectomy on the development of induced cancer in rats, H P Bayon found in the blood of these rats, about three to five days after splenectomy, numerous intracellular microorganisms corresponding in every morphological particular to the Bartonella found in Carrion's disease (Oroya fever In some rates the multiplicaand verruga) tion of this germ in the erythrocytes caused the appearance of a progressive anemia which ended in hematuria and death within three In others the Bartonella persisted for a fortnight or more and then disappeared with-The microout leaving any apparent effects organism was cultivated and found to be a pleomorphic Gram-negative rod, which corresponded in shape and size with the organism described by Noguchi (1927) under the name Bartonella bacıllıformıs, and with that described by Mayer, Borchard, and Kikuth (1927) as Bartonella muris This work confirms the splenectomy experiments on rats of Martin Mayer and his coworkers (1927) There is such a striking resemblance between the behavior of the Bartonella in splenectomized rats and that of Grahamella in many rodents, that Bayon considers them closely re-It is therefore quite possible that, in countries where Oroya fever and verruga are endemic, some small mammal may act as a reservoir of the virus These investigations are also of interest in reference to the part played by the spleen in preventing the spread of bacterial infections. It is clear that splenectomy in rats does not produce the Bartonella, but causes what must be a latent or cryptic infection (of the endothelia?) to generalize, and appear in the blood through the rapid multiplication of a small number of microorganisms This study also suggests that the hematogenic localization of the Bartonella in man (Oroya fever) may depend upon an impaired function of the spleen, such as might conceivably result from typhoid fever or malaria, and typhoid and paratyphoid fevers have frequently complicated the diagnosis of Oroya fever - Journal of Tropical Medicine and Hygiene, February 1, 1928, xxxi, 3

The Problem of Postvaccinal Encephalitis—Professor H Pette of the Hamburg-Eppendorf Hospital refers to the fact that exceptional forms of general acute infectious disease may leave sequelæ involving the central nervous system. The primary affection may be one of the milder types, notably measles or chickenpox, and it was therefore no great surprise to neurologists to note that a small number of cases have followed ordinary vaccination. The problem is by no means as

MEDICAL PROGRESS

Some Problems in the Etiology of Cardiac Failure - Sir John F I Broadbent, writing in the Lancet of February 4, 1928 (ccxiv, 5449), discusses the factors that may contribute to the production of heart failure under three headingsvalvular disease, affections of the myocardium, and disorders of rhythm A consideration of the changes incident to valvular disease makes it obvious that these, when severe, may be an important contributing factor to heart failure Affections of the myocardium are more important and more difficult to estimate. relative importance of the factors which may contribute to a cardiac breakdown

Nitroglycerin - Louis Faugères Bishop, writing in the Medical Review of Reviews, February, 1928, xxxiv, 32, outlines certain information which the doctor should give the patient concerning the use of nitroglycerm This drug, which is a valuable symptomatic remedy in various untoward symptoms arising from a diseased cardiovascular system, unless used properly, is often mert or dangerous It is better to give small doses frequently rather than one large dose About 1/225 of a grain at a time is the proper amount, this can be repeated every fifteen minutes until relief is obtained The patient should be told that mtroglycerin pellets should be chewed in the mouth and not swallowed, because the action of the drug is much better when absorbed by the buccal mucosa He should be instructed that nitroglycerin tablets obtained from a druggist are often mert Physicians should obtain a freshly made supply for their own The doctor should use from time to time never forget to tell the patient that a dose of nitroglycerin may cause a transitory headache and a sense of fulness in the head due to the fact that there is more blood stasis in the brain while the drug is acting, due to its vasodilating effects, and the headache is no contraindication to its use

Hemolytic Streptococci in Miscellaneous Throats - Professor Burgers of the Königsberg Hygienic Institute has for many years past studied smears from the throats of the sick and well, and among the flora the hemolytic streptococcus has been present in great fre-A request broadcast to colleagues for smears with clinical diagnosis appended has brought in additional material, so that the author can tabulate 300 cases in which some kind of angina was present. In 134 of these streptococcus cases the clinical diagnosis was follicular tonsillitis, in 60 it was clinical diphtheria (without Klebs-Loeffler bacilli), in 35 there was merely transient redness and swelling of the tonsils, and in 34 scarlet fever The remainder were divided among quinsy, diphtheria with bacteriological confirmation, Plaut-Vincent angina, etc In over half the cases there was nothing to suggest contagion, including chiefly follicular tonsillitis and quinsy In only a few straggling cases had these patients been exposed to a known contagious angina On the other hand, weather influences

Sodium There was no edema twitchings sulphate solution was at once infused into an arm vein, the patient at the same time wearing a retention catheter Although no urine had appeared for some hours it at once began to escape through the catheter In the course of 20 minutes 450 cc of 5 per cent solution was injected and followed by the same amount of saline infusion. The patient began to improve in all respects and save for a trace of albumin his renal functions became normal From this very limited experience the opinion might be hazarded that what may be termed terminal uremia at the close of years of progressive renal inefficiency cannot be influenced at all by the treatment in question, but acute uremia in kidneys nominally able to function may be rapidly influenced favorably

Bacteriophagy in Urinary Infections Following the Administration of the Bacteriophage Therapeutically — Janet Anderson Caldwell, writing in the Archives of Internal Medicine, February, 1928, xh, 2, states that 75 consecutive cases of urinary infections which she has studied, sewage filtrate (which contains lytic principle of marked activity for most of the gram-negative bacilli found in cases of urinary infection) has lyzed 90 per cent of the strains of bacilli isolated from the catheterized specimens of urine The bacteriophage employed was isolated from sewage filtrate in the usual way and was built up on the patient's organism by a few serial passages until it gave maximum or marked lysis It was always concentrated by adding an entire agar slant suspension to 20 or 25 cc of the filtrate and incubating until lysis occurred (from eight to eigh-The concentrated filtrate was teen hours) given by subcutaneous injection and lavage of the bladder, usually daily or every other day for from three to six injections. In 12 patients the processes of bacteriophagy have been followed through frequent cultures of urine and examination of urine filtrates The bacteriophage could be recovered from all urines following treatment except those which became The bacteriophage recovered was always similar in strength to the one administered, and made its appearance in the urine in periods varying from a few hours to the third In all cases in which the urine was not sterilized, and in some of the latter cases before sterilization, the organism was modified in respect to its growth characteristics, but the cultural characteristics remained unchanged The organism as modified was always resistant to the bacteriophage administered, but could be lyzed by sewage filtrate, with but one exception From these it is clear that the chief

problem in the use of the bacteriophage in urinary infections is that of the ready adaptability of the organisms (B coli and B pyocyaneus) usually found in these cases, so that they become resistant to the bacteriophage adminis-To combat this difficulty the bacteriotered phage used should not permit the early development of secondary cultures It should be prepared and administered promptly, at frequent intervals and in adequate quantities so as to lyze the main bulk of organisms quickly, thus preventing the modification which results in resistance If necessary, cultures should be relyzed by sewage filtrate, and the second filtrate should be administered

Treatment of Nervous Air Swallowing -Prof I H Schultz of Berlin states that this condition, for whatever reason, is not common in Germany, as pointed out by Goudberg of Rotterdam, who with Mathieu of Paris is specially mentioned as an authority on the affection, known also as nervous eructation and aerophagy These authors associate the syndrome with nervous dyspepsia After these dyspeptics have eaten they feel uncomfortable and begin to belch, especially patients who bolt their food. In their attempts to dislodge the superfluous gas, false belching develops during which they are in reality swallowing air In time a prolonged genuine belch really evacuates the stomach, but relief is only temporary for air swallowing is renewed and the picture is repeated. This account applies to many cases but not to all, and the author isolates quite a distinct type from the preceding. Here the patient already has his stomach distended before he finishes eating and there is none of the false belching Such patients cannot benefit by refraining from swallowing after meals, by wearing a gag, etc. Study of this type may show a certain incoordination between swallowing and breathing, but fast eating certainly plays no role Just before and during the act of swallowing a gasping inspiration may be noted and even at times heard, which makes it possible for air to enter the stomach bad habit may be broken up by proper evercises, beginning with fluid nourishment and the patient will learn to swallow his food during the expiratory phase of breathing or the pause, when it will be found that the stomach is no longer tympanitic after eating. The author has cured many cases in this manner, after many internists and neurologists had The most striking feature of the author's brief paper is failure to mention fluoroscopic control, which indicates that he has not found this resource necessary for diagnosis -Deutsche medizinische Wochenschrift, January 20, 1928

simple as it appears, for as yet we have no proof that the diffuse encephalomyelitis which develops in these cases is due to the infectious agent of measles, etc, or to some other and associated infection, such as the unknown neurotropic virus of lethargic encephali is The viruses of measles, varicella, and vaccinia are not neurotropic. The author after many animal experiments has been unable to produce any neurotropic symptoms with vaccine We may then take up the other possibility that vaccinia, etc, pave the way for a second infection of unknown nature. But the author will not take refuge in the theory that these affections merely pave the way for an attack of ordinary lethargic encephalitis, and in fact he assails this explanation. On the other hand there has been a disposition in the past few years to regard acute diffuse encephalomyelitis as arising from a variety of One must under the circumstances think of the possibility of a virus which is present in the body—perhaps in the nasal passages—which is lighted up to activity by various causes that lower specific immunity In the author's animal experiments the intensive use of vaccine virus was shown to have mobilized the Bacillus bipolaris which in turn caused fatal sepsis Some such association may well be responsible for post-vaccinal encephalitis in mankind —Munchener mediz nische Wochenschrift, February 3, 1928

The Present State of Our Knowledge of Gingivitis—On the basis of an experience with 5,000 cases of gingivitis and a study of the reports of 4,347 cases examined bacteriologically, Robert A Keilty finds that 964 per cent show the presence of a spironema, 716 per cent show Endameba gingivalis and 666 per cent show a bacterial flora These groups alone or in combination are the direct etiological factors in every case of the disease, and all other factors are contributory or subservi-The problem of gingivitis is most important masmuch as over 90 per cent of our population have the disease in one form or The term "pyorrhea," representing as it does the end-stage of the disease, should be immediately discarded for a more inclusive Gingivitis, qualified as acute, subacute, or chronic, is suggested, since the disease in all its stages is an inflammation of the gingivæ It is also suggested that the term Vincent's spirillum should be discarded, as this organism probably belongs to the genus Borrelia, and likewise Vincent's angina or trench mouth, as this is nothing more than a flare-up having its origin in a gingivitis The gingivæ are the most potential sources of foci of infection in the body, being more important than the periapical sources Gingivitis will subside and can

be absolutely kept under control by appropriate therapeutic measures intelligently applied There is no one specific treatment. All contributory factors—pathological changes in the nose, mouth, tonsils, or sinuses-must be recognized and means taken to control them If bridges or crowns are wrong they must be Gross collections of tartar should be removed, but the general process of scaling is absolutely to be condemned. The same holds good for all the mandril polishers, stones, and wheels, which do more damage than good After a general clean-up a return check-up should be carried on about once a month The aniline dyes, arsphenamine, emetine, Dakin's solution, hot water irrigations, sodium perbolate, hydrogen peroxide, in some combination to fit the bacteriological flora; are the best Mouth washes, tooth powders; and remedies pastes are valuable merely for cleansing, but have no direct influence on the specific factors of gingivitis The method of administering drugs is most important. The use of the rubber cup, advocated by Vastine, is by far the most direct and efficient method so far devised Keilty is opposed to all operative procedures on the gums, except in special cases, for example where one pocket is almost a sinus and a small incision would facilitate drainage or the application of remedies - Journal of Laboratory and Clinical Medicine, February, 1928,

Treatment of Uremia by Intravenous Infusion of Hypertonic Solution of Sodium Sulphate - K O Moller of Copenhagen refers to the diuretic value of this infusion, notably in animal experiment Although Volhard recommended its use in bilateral hematogenous nephritis, it does not appear that the infusion as such had ever been tested on human patients until the author took up the subject (Klimsche Wochenschrift, January 22, 1928) The total number of patients tested thus far is four and the author is frank to state that in three not the slightest benefit was obtained In the fourth patient however, the good effects were so startling that we can look forward to an advance in the treatment of selected cases The patient helped was a man of 52 who presented at the outset a little albumin in the The basic disease was chronic bronchitis with emphysema and some cardiac hypertrophy and anemia (hemoglobin 65 per The blood pressure was normal and this was true also of the blood area concen When the general health showed a further decline it was found that urine was becoming scanty and contained albumin and blood, and at the same time uremia suddenly appeared with malaise, vomiting, benumbing of the brain and restlessness with muscular

right leg, which movement caused pain He was treated one or more times in each month from July to a year from the following October That injections of solutions and drugs in the vicinity of the spine between the shoulder blades and the right hip were made by the defendant, and that the defendant had also prescribed certain drugs to be taken internally by the plaintiff That the physician had failed to diagnose the plaintiff's case correctly because of improper tests and improper examinations and because of the failure to properly interpret the result of the examina-That the plaintiff's condition tions and tests was wrongfully diagnosed as syphilis, also that the defendant improperly handled the needle in administering the injections so as to make and cause large holes in the plaintiff's back,/which still remain and are permanent. That the injections were wrongfully made in the plaintiff's back between the shoulder blades, where such injections should not have been made, and solutions and drugs were administered, which never should have been used in the absence of syphilis, and they were also used in quantities that were excessive and dangerous irrespective of what the That the defendant had wrongfully disease was injected salvarsan and mercury and other drugs in excessive quantities That the defendant physician had exhibited lack of knowledge, skill and diligence in failing to diagnose plaintiff's malady correctly, in failing to make personally any tests or examinations, but in diagnosing same as a disease with which plaintiff was never afflicted and which is unmistakeable in its symptoms the plaintiff's condition was aggravated and his ailment prolonged and he was required to procure medical services from other physicians That since his treatment by the defendant he has been

unable to work or to work only part time

It appears that the plaintiff was referred to
the defendant in July, and the plaintiff was advised by the physician that he did not undertake
the treatment of any syphilitic conditions until
such time as the patient had had a diagnosis
made of his condition either by the Board of
Health or by a laboratory of his own selection
That the plaintiff thereafter went to the Board
of Health and about six days later a certificate
was received by the doctor reporting a four plus
Wassermann of the plaintiff No agreement of
any kind was made by the defendant to cure the
plaintiff, the physician merely stating that he

would give the plaintiff a course of salvarsan or mercury and such course of treatment to include as many injections as may be necessary to overcome the condition. The plaintiff had a stiffness in the hip which he described as a peculiar rheumatic pain coming on when the weather changed. The defendant physician submitted the plaintiff to the Argyll-Robertson knee reflexes and Romberg's tests, also examined the retina of the eye for central degeneration of the optic nerve. Examination was also made of the urine, which was negative

From his examination the defendant found the plaintiff to be suffering from an anemic condition and malnutrition His skin was sallow and cold, his blood pressure was subnormal. The physician informed the patient that there was more or less reactionary pain to the injections which would last sometimes three or four days and which would sometimes tend to form an area of induration or hardening He further informed the patient that where a quantity of salvarsan was administered intravenously, there was more or less of a tax upon the heart structure and kidneys, particularly where an individual was run down and emaciated and his resist-He therefore, suggested that the patient have at least two or three injections of an emulsified salvarsan in oil of sesame as there would be a slow absorption, but not a dangerous constitutional reaction. After one injection of 1/4 gr of salicylate of mercury the plaintiff developed a severe case of mercurialism which was attended and treated by the defendant physician fendant was called to the patient's home where he found him lying in bed with his tongue protruding and black, with a towel under his head com-The physician administered pletely salivated permanganate of potassium and remained with the patient for about two hours, administering to him The physician repeatedly visited the patient for over a period of a week and a half until the untoward condition had cleared up A subsequent Wassermann test also showed a four plus, indicating that after two injections of salvarsan the patient's blood was arsenic fast. The patient about this time left the care of the defendant and received no further treatment from him, and nothing was heard until the institution of the action

The action finally came on for trial and resulted in a verdict by the jury in favor of the defendant

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

SURGEON SENTENCED TO THE ELECTRIC CHAIR

A recent dispatch to the New York Times informs us that Dr Amante Rongetti, of Chicago, former owner of the Ashland Boulevard Hospital, was on March 9th sentenced to die in the electric chair for having caused the death of Loretta Enders by means of an illegal operation "It was said here," declares the news dispatch, "that the death sentence on Rongetti is the first ever imposed on a surgeon in this country in a case growing-out of an illegal operation" In pronouncing the sentence, the judge pointed out that the evidence indicated that Dr Rongetti had permitted his patient to die because she did not have any money and had not paid her bill

So far as our researches of the New York decisions are concerned, we find no case where the death sentence was imposed upon a surgeon as a result of an illegal operation Yet, under the statutes of this state, any doctor who, while engaged in the performance of an illegal operation, causes the death of his patient, may be indicted and convicted for

murder in the first degree

Sec 80 of our Penal Law provides

"A person who, with intent thereby to procure the miscarriage of a woman, unless the same is necessary to preserve the life of the woman, or of the child with which she is pregnant, either

"1 Prescribes, supplies, or administers to a woman, whether pregnant or not, or advises or causes a woman to take any medicine, drug, or substance, or, "2 Uses, or causes to be used, any instrument or other means,

"Is guilty of abortion, and is punishable by imprisonment in a state prison for not more than four years, or in a county jail for not more than one year"

Sec 1044 provides that the killing of a human being, unless it is excusable or justifiable, is murder in the first degree when committed "with a design to effect death, by a person engaged in the commission of, or in an attempt to commit a felony, either upon or affecting the person killed or otherwise" The crime of abortion in this state is a felony

Any physician, therefore, who brings about the miscarriage of a woman unless such miscarriage was necessary to preserve her life or that of the child with which she is pregnant, renders himself liable not only to indictment and conviction for the crime of abortion, but if the woman dies he may be indicted and convicted for murder in the first degree Judging by the news dispatch from Chicago, that was the lot which befell the physician in that case

Any member of the medical profession, therefore, who embarks upon a practice of this kind or even upon a single illegal abortion, has not only abandoned every principle of right, has not only rendered himself liable to imprisonment for felony, but actually has begun the march which may lead on to the electric chair

IMPROPER TREATMENT OF SYPHILIS

It was claimed that in the month of July, a physician had been engaged to cure the plaintiff of a malady from which he was suffering, a stiffness and pain in and about his right hip joint. That the defendant physician agreed for a stated price, to cure the plaintiff. That the physician did not use reasonable care in his attendance and treatment and negligently prescribed and administered, by hypodermic injections in the patient's back and right hip, a dangerous and injurious drug, and prescribed and administered said drug in excessive doses which, in the proper exercise of care and skill should not have been administered to the

plaintiff It was further charged that the defendant failed to discover the plaintiff's true condition, but undertook to treat him for some other malady which he did not have That the plaintiff's health was greatly injured and he suffered intense pain, was obliged to expend large sums of money in an endeavor to be cured of the malady, which was aggravated, prolonged and increased, and that his health had become permanently impaired

The plaintiff more specifically alleged his claims and injuries and stated that his malady was a stiffness in and about the right hip joint with accompanying pain which impeded the movement of his

Discussion opened by Louis B Mount, MD, Albany

From the Pathological Laboratories, Bellevue Hospital, Douglas Symmers, M.D., Director, and the Third Medical Division, Bellevue Hospital, John Wyckoff, M D, Director

Exhibit arranged by Clarence E de la Cha-

pelle, MD

Group I Rheumatic Heart Disease -Included in this group are those specimens illustrating the various lesions of activity and inactivity

Syphilitic Heart Disease -This Group II group includes both the specimens of myocardial involvement and those with syphilis of the aorta and its sequelae, e.g., dilatation, aneurysm, aortic valve and coronary artery involvement

Group III Bacterial Infection of the Heart -In this group are found the specimens with disease of the structures of the heart resulting from infection by the pneumococcus, streptococcus (hemolytic-and viridans) staphylococcus, gonococcus and the tubercle bacillus

The specimens of streptococcus viridans endocarditis constitute a separate subdivision under

this group

Group IV Thyroid Heart Disease —Demonstration of enlarged hearts associated with disease of the thyroid

Group V General Systemic Disease -In this group are seen the specimens of arteriosclerosis

with lesions of the aorta, coronary arteries, myocardium and endocardium. Here also are found the hearts associated with chronic nephritis, hypertension, diabetes, pernicious anemia and others

Traumatic Heart Lesions - Speci-Group VI mens of trauma to the heart and aorta

Group VII Tumors of the Heart - Demonstrations of new growths, both primary, secondary and parasitic cysts

Group VIII Congenital Developmental Defects—Exhibition of general and special anomalies of the heart

Accompanying each specimen is a description of the post-mortem findings and an abstract of the clinical data of the case With each group there are microphotographs of the outstanding lesions

A specimen of coarctation of the aorta with superimposed bacterial endocarditis

From the University of Rochester School of Medicine and the Strong Memorial Hospital, William S McCann, M D, Physician-in-Chief

Exhibit of injected human hearts showing the blood supply to heart muscle and valves

From the Laboratories of the Mount Sinai Hospital, New York City, Louis Gross, MD, Director

THEATRE PROGRAM, ADDRESSES AND DEMONSTRATIONS

Thursday, May 24th, 1928 Microphotographic Studies Lontern Slide Demonstration

JOINT MEETING OF ALL SECTIONS OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Wednesday, May 23rd, 1928, at 8 P. M

Dr James E Sadlier, Presiding

"Cost of Medical Care or Hospitalization of the Middle Class Economic Group," Thomas P Farmer, MD, Syracuse

"The Medical Aspects of Workmen's Compensation," William Warren Britt, M.D.

Tonawanda

"Morals of Medicine," Harry R. Trick, MD, Buffalo

"Present Status of the Practice of Medicine," Linsly R Williams, M D, New York City

"Future of the Practice of Medicine," Ludwig Kast, M.D., New York City

THE SCIENTIFIC EXHIBIT

The feature of a scientific exhibit which was instituted in 1925 will be adopted again this year. But whereas in former years the last day of the meeting was set aside for the exhibit, this year the exhibit will be on view during every day of the meeting, while the program of the last day will be devoted to papers and demonstrations

The exhibit will be on the subject of the heart and its diseases, and will be shown on the floor of the Armory, where the doctors will congregate and lounge between the scientific sessions. The place and time will afford the physicians the opportunity to study the specimens and charts at their lesisure.

CARDIAC EXHIBIT AND DEMONSTRATION

Open Every Day of the Annual Meeting

Place-Drill Floor, State Armory, Washington and Lark Streets

Monday, May 21st, 2 PM to 5 PM Tuesday, May 22nd, Wednesday, May 23rd, and Thursday, May 24th, 10 A. M to 5 P. M

A demonstration of gross specimens, photographs and nucrophotographs of the various etiological types of disease of the heart and aorta.

THE COMMERCIAL EXHIBITS

The manufacturers who provide the physicians with the means of practicing medicine will be provided with booths in the center of the Armory where all the doctors will assemble daily Physicians as well as exhibitors will appreciate the easy

accessibility of the booths and the opportunity to ask and answer questions regarding the various wares that are shown. The exhibit will open on Monday afternoon and remain on view until six o'clock Thursday.

RECEPTION TO EXHIBITORS

The members of the Medical Society of the State of New York recognize the value of acquaintanceships with the exhibitors and they will therefore tender them a reception on Monday evening. This feature was successfully inaugurated

last year, to the mutual satisfaction of the exhibitors and the officers of the Medical Society of the State of New York Brief talks will be given, and an entertainment provided, and finally refreshments will be served

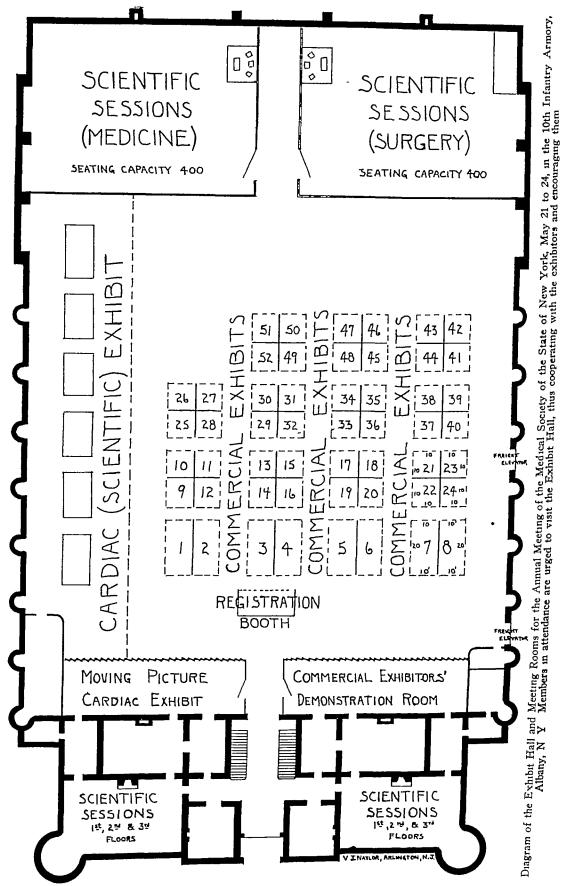

MANUFACTURERS' SECTION

The new feature of a manufacturers' section will be added to the program. A room on the main floor of the Armory will be provided with projection apparatus for showing stereopticon slides and moving pictures, and a program will

be arranged in which a number of exhibitors, probably eight, will be given the opportunity to show pictures of their products, and give talks on their uses. This program will be carried out on Wednesday, both morning and afternoon

FOODS AND BEVERAGES

Booth 25—R. B Davis Company, Hoboken, N J, will feature Cocomalt which gives milk a delicious, creamy chocolate flavor, pleasing to both children and adults. They will drink milk without urging. At the same time Cocomalt increases the food value of the milk over seventy per cent.

Cocomalt adds to the diet the essential and necessary vitamins and mineral matter, calcium, phosphorous, iron, etc., in a form which is readily

digested and assimilated by the body

Booth 19—H T. Dewey & Sons Co, New York, pioneer manufacturers of medicinal wines, will exhibit their preparations, including Dewey's Emulsion of Cod Liver Oil, Port Wine and Irish Moss which is a product valuable for its ingredients and because it is easy to take and digest Dew-Tone and Port, a preparation recommended for elderly and anemic people will also be exhibited. It is only sold direct from their New York Store or their cellars at Egg Harbor, N. J., no Federal Prescription blanks being necessary Physicians or their patients outside of the city can order it by mail. No drug store is allowed to carry Dew-Tone and Port

Booth 20—Dry Milk Company, New York, will, as usual, be represented at the forthcoming convention, showing their product Dryco, which will this time have increased interest for the doctors, due to the fact that all Dryco is irradiated with the ultra violet ray, giving it marked antirachitic properties. It is the only milk or food product which has these new and additional properties

All Dryco has been irradiated for over a year The experimental work was started in 1924, following the disclosures of Hess and Steenbock Clinical tests made during the past two winters confirmed the laboratory tests showing that irradiated Dryco has antirachitic properties of great

potency

Booth 48—Horlick's Malted Milk Corporation, Racine, Wisconsin, will show Horlick's

Milk Modifier, a maltose and dextrin sugar for the modification of cows milk in the feeding of infants

Horlick's Chocolate Malted Milk, a blend of the original with sweet chocolate and cocoa of highest grade, is meeting with much favor as a means of inducing children to take their normal requirement of milk

Horlick's Malted Milk, natural flavor, is one of the few foods of civilization which has been taken to both the North and South Poles

Booths 37 & 38—Charles B Knox Gelatine Co, Inc., Johnstown, N Y With the growing importance of gelatine for various dietetic purposes, the Knox Gelatine Exhibit will interest physicians who are interested in dietetics. Elaborate dishes suitable for various diets will be on display and diabetic, liquid and soft diets, milk formulas, and other recipe material will be available.

Booth 35 — Mead Johnson and Company, Evansville, Indiana, will show its well known products used in infant feeding

Booth 3—Merrell-Soule Company, Syracuse N Y, qualified representatives, will be ready at all times to discuss the application of the Merrell-Soule group of products in infant feeding and adult diet. Klim Powdered Whole Milk will be served and the technique of preparing Merrell-Soule Powdered Protein Milk, Merrell-Soule Powdered Whole Lactic Acid Milk and their fat free companion products will be demonstrated Vi-Mal-Dex, a carbohydrate with added orange juice, will be featured and its applicability to certain feeding problems will be stressed

Booth 27—Mellin's Food Company, Bost n Mass The yearly meetings of the Medical Society of the State of New York offer unusual opportunities for physicians to discuss freely matters directly concerning products which they find of advantage to employ in their professional work This is an outstanding reason for the Mellin's

Food Company's exhibit.

PHARMACEUTICALS

Booth 30—Abbott Laboratories, Chicago & and New York, will exhibit some of its newer preparations, such as Ephedrine products for Asthma and Hay Fever, Amiodoxyl Benzoate for Arthritis, and the Arsenicals of the Dermatological Research Laboratories

Booth 24—Crystal Chemical Co, Inc., New York, will have an exhibit of their products, especially Z B T Baby Talcum. This product contains two per cent of stearate of zinc, mixed with boric acid and the finest imported tales. It is of great value, not only for babies but also as a protection of the skin when bandages are applied, and as a dressing for chronic ulcers and sores.

Booth 46—The Denver Chemical Mfg Company, New York, will show antiphlogistine, a poultice and dressing of wide utility in many cases of inflammation and congestion

A new booklet, "Infected Wound Therapy" has been published telling of the results of experiments with the ingredients of antiphlogistin This will be available gratis at the exhibit booth

Booth 33—Deshell Laboratories, Inc., Chicago, Ill, will exhibit Petrolagar Ask for the set of drawings by Tom Jones, of the University of Illinois, illustrating various types of constipation and bowel conditions. Sets are given free or mailed. They are helpful in consultations with patients and for comparison with roentgenograms.

BOOKS

Booth 51—P Blakiston's Son & Company, Philadelphia, Pa The Blakiston exhibit will be of special interest because of the recent publication of a number of really practical books serving to bring in closer contact the work of the specialist and the general practitioner "Atlas of Skin Diseases", "Deaver's Surgical Anatomy", "Recent Advances Series", "Gould's New Medical Dictionary", etc, all are books which should be examined

Booth 12—F. A Davis Company, Philadelphia, Pa, will exhibit a number of new books of unusual importance, including Strickler's "Diseases of the Skin and Syphilis," Drueck's "Fistula of the Anus and Rectum," Cowan's "Ophthalmic Optics," Marcovici's "Handbook on Diet," and Behrend's "Surgical Diseases of the Gall-Bladder, etc"

There will also be shown new revised edition of Ball's "Modern Ophthalmology," Bassler's "Diseases of the Intestines, Including the Liver, Pancreas and Bile Ducts," Martinet's "Clinical Diagnosis," Martinet's "Clinical Therapeutics," Blum's "Practical Dietetics," Hess on Infant

Feeding, etc., Petty on Diabetes and a number of others

Booth 36—C. V. Mosby Company, St Louis, Mo, Medical and Dental Publishers, will exhibit their complete line of publications. Included in this exhibit will be a number of new books and new editions, together with their four medical journals.

Booth 50—W. B. Saunders Company, Philadelphia, Pa, Publishers, will have on exhibit a complete line of its work totaling 250 titles. Of particular interest to those attending the convention will be the new books and new editions, which include Blumer's "Bedside Diagnosis", Pelouze's "Gonorrhea in the Male", Cecil's "Medicine", new edition of Ewing's "Neoplastic Diseases", "The Medical Clinics of North America and the Surgical Clinics of North America, "American Illustrated Medical Dictionary", Refusis' "Diseases of the Stomach", Crohn's "Affections of the Stomach", Palfrey's "Specialties in Practice", McLester's "Nutrition and Diet", Todd and Sanford's "Clinical Diagnosis", Stevens' "Therapeutics", Jackson's "Bronchoscopy", Ford's "Bacteriology", Morse's "Biochemistry"

ELECTRO-THERAPEUTICS

Booth 22—H G. Fischer & Company, Inc., Chicago, Illinois, will exhibit some entirely new developments in the field of physical therapy. The new 1928 model Low Voltage and Wave Current Generator is of marvelous simplicity, and yet makes available all of the fifteen low voltage currents, and will aso have a spendid new diathermy apparatus in cabinet and portable form

Booths 43-44—K. & B. Electric Equipment Co., Inc., New York again takes pleasure in presenting to the medical profession its latest developments for office use, principally its splendid line of ultra violet ray lamps and diathermy equipments. Also its orthodiagraphoscope for heart tracings

Booth 7—Victor X-Ray Corporation, Chicago and New York Only one who has operated one of the older type electrocardiographs can appreciate the simplicity and ease of operation, the compactness and flexibility of the new electrocardiograph By a method similar to radio amplification, it "steps up" the feeble heart current to a point where it will actuate a sturdy galvanometer, thereby eliminating the fragile quartz string required in former types because of the infinitesimal actuating current. The Victor in-

strument can therefore be moved about freely without fear of damage

No longer need a hospital be wired for electrocardiograph service. The Victor instrument being entirely self-contained, is simply wheeled to the patient's bedside or carried to the patient's home when necessary

Special technical skill is not needed to operate the Victor cardiograph, anyone can produce cardiograms of excellent diagnostic value after an hour's instruction. There will be shown a collection of Physical Therapy apparatus, and also the Victor Office and Portable X-ray Outfit.

Booth 6—Wappler Electric Co, Long Island City, N Y, will exhibit the Monex, one model of their latest development in Valve Tube X-ray Apparatus The most prominent radiologists of the country have accepted this latest invention because it has been proven a scientific advancement over the former mechanically rectified machines

It will also show a full line of physical therapy apparatus and diagnostic instruments. The Myostat, after several years of intensive study on the part of a committee of medical men, physicists, and engineers, will be shown and demonstrated. This apparatus delivers a true galvanic current, ground free, and without ripples or oscillations.

and found to be the equal of anything on the market. The Vertical Fluoroscope, Horizontal builtin bucky table, and the complete line of X-ray transformers, invite inspection

For diathermy, auto-condensation, electrocoagulation and fulgeration. The Campbell new Model C. A meets the requirements of the physician practicing electro-therapeutics.

Booth 18—The De Vilbiss Company, Toledo Ohio, will exhibit a complete line of nose and throat atomizers, nebulizers, powder blowers and steam vaporizers, both for physicians' use in the office and patients' use in the home

Table B, Opposite Registration Booth—Gillette Camera Stores, Inc., New York The Motion Picture Display is of special interest because it features the new 16 millimeter amateur equipment which is particularly adapted to use by the medical profession. Motion pictures have proved their value in graphically recording case histories and giving instruction in surgical operations. This new substandard equipment has brought the price within the reach of all. Complete outfits sell from \$130.00 up.

Booth 4—Hanovia Chemical & Mfg. Company, Newark, N J, calls attention to the new Sollux Radiant Heat Generator, embodying a uniqueness which is of vital importance in this therapeutic field, also to the standard Alpine Sun and Kromayer Quartz Lamps which meet all conditions for which quartz light therapy is indicated and used.

Staff members will welcome you and give you any data you may require on the subject.

Booths 15 & 17—Harold Surgical Corporation, New York, a consistent exhibitor at the New York State Meetings, has this year a special line of Chrome Plated Instruments and Gold Seal Syringes—Its line of physio-therapy apparatus has been enlarged—It includes the Multotherm, which has a cutting current, the Portatherm, a substantially built diathermy apparatus, the Tropico Sun Carbon Arc Lamp, and others

Booth 42—The Kny-Scheerer Corporation, New York, will exhibit, among other things, its famous Model No 3 Operating Table which can be raised, lowered, or rotated by means of one pedal, thus eliminating confusion which is likely to occur where there is multiplicity of pedals

The exhibition will feature monel metal as the outstanding material for table tops because it will not break, chip, or stain by any solution used in surgical procedure. There will also be shown an efficient but compact (multum in parvo) sterilizer for the physician's office, affording him an efficient sterilizing unit for every purpose.

Table C, Near Registration Booth—New York Physicians' Mutual Aid Association, New York Organized in 1868 Life insurance for physicians of New York State only Dr G H E Starke will be in charge Physicians are cordially invited to visit this space for full particulars of the Mutual Life Insurance.

Booth 49—The Pollen Filter, Inc., Cleveland, Ohio, will show the Polleniar Filter, a most startling advance in hay fever and pollen asthma prevention and relief. By means of this simple electrically operated device, a hay fever resort can be produced in any patient's bedroom or workshop. It maintains pollen and dust free air in his environment and prevents the inhalation of causative pollens. Full details can be obtained in Booth No. 49 where machines are being demonstrated.

Booth 47—Sanborn Company, Cambridge, Mass, cordially invite you to a complete demonstration of the Sanborn Grafic Metabolism Tester The Grafic measures and automatically records in ink the patient's oxygen consumption during a Metabolism Test. This chart record visibly tells you if the test is normal, too high (hyperthyroid), or too low (hypothyroid)

Booth 14—C. M Sorensen Company, Inc., Long Island City, N Y, will exhibit a line of compressors and aspirators, especially the famous Deluxe Equipment This equipment is endorsed by its many users, and over \$100,000 worth is serving many physicians and patients

Then there is the heavy duty large four-cylinder ether and aspirating apparatus, the new and improved Yankauer Portable, with other outfits, plus the chair and stool

Table A, Opposite Registration Booth—The Spencer Lens Company, Buffalo and New York, will exhibit its newest developments in Microscopes, research Instruments, and allied apparatus of interest to the medical men and laboratory worker. One of the outstanding features will be the new No 44 M-H, a laboratory model Microscope with new convertible dark-field and built-in mechanical stage. It will also show two new sliding Microtomes, especially the new No 860 model and the new No 7-H, the Microscope De Luxe which is the finest research instrument offered by any manufacturer.

There will also be a display of Spencer Projection apparatus, two models of which will be used in the dark room in which the Exhibitors' Section will be held

Booth 16—George Tiemann & Company, New York, pursuing its usual policy will confine its efforts largely to the showing and explanation of new instruments and devices that have come These pictures are distinctive and somewhat different from the usual anatomical drawing of the bowel in that they show the perspective

Booth 23—Fellows Medical Manufacturing Co., Inc., New York will exhibit Fellows' Compound Syrup of Hypophosphites, a concentrated mineral pabulum, possessing therapeutic properties in all wasting diseases, which have been termed "Demineralizations" by modern clinicians. It supplies the organism with these indispensable mineral elements, Manganese, Potassium, Sodium, Calcium and iron together with the dynamic action of quinine and strychnine.

Booth 1—Hynson, Westcott & Dunning, Baltimore and New York, will exhibit Mercuro-Many doctors use Mercurochrome in their practice, but few doctors use it for all the purposes for which it can be employed If you are using Mercurochrome in the eye, try it in the ear, nose and throat; if for urethritis in the male, try it for cervicitis in the female, if in accidental wounds try it in surgical wounds, if for the preparation of obstetrical cases, try the special alcohol, acetone, aqueous solution for pre-operative skin sterilization; if in erysipelas, try it in There is hardly an ineczematoid ringworm fection or infected condition in which a thorough trial of the value of Mercurochrome is not worth while

Booth 11—Mutual Pharmacal Company, Inc., Syracuse, N Y, will exhibit products of their laboratory during the Annual Meeting of the State Society

The Company maintains, as a unit of their well equipped laboratory, one of the most mod-

ern analytical departments in the State

Physicians are cordially invited to visit the booth and inspect the products shown

Booth 9—The Charles H. Phillips Chemical Co., New York & London The merit of "Phillips" Milk of Magnesia as the Ideal Laxa-

tive-Antacid is well established. It has had the unqualified endorsement of the profession for more than half a century

"Phillips" Milk of Magnesia, as well as "Phillips" Dental Magnesia, a superior tooth paste based upon "Phillips" Milk of Magnesia, will be on display at this annual meeting

Booth 28—E R Squibb & Sons, New York, will have an exhibit which include Erysipelas Antitoxin Squibb, Squibb Authorized Scarlet Fever Products, Squibb Diphtheria Products, Insulin Squibb, Squibb Arsphenamines, and other Squibb Biologicals, Chemicals and Pharmaceutical Products

Booth 2—Tailby-Nason Company, Boston, Mass, producers of Nason's Palatable Cod Liver Oil, will have a display of their "Better tasting" medicinal cod liver oil with pictures showing the conditions under which it is produced. An important part of the demonstration will be the white rats used in testing the oil for its vitamin activity.

Booth 10-William R. Warner & Co., Inc., New York, will be among the many interesting

exhibitors at Albany

Agarol has won friends among countless numbers of the medical profession Representatives will be on hand to welcome physicians to their booth and to present to those desiring them, quantities of Agarol Physicians may also obtain copies of some of the interesting literature issued by William R Warner & Company during the past year This literature includes the booklets, "Some Common Causes and Forms of Fecal Retardation," "The Rôle of Hyperacidity in the Causation of Disorders of Metabolism," "pH 7 4" and "Building Resistance"

William R Warner & Company is interested in this meeting and is anxious to cooperate with the physicians attending. They will be glad to

be of service to anyone calling upon them

SUPPLIES FOR PHYSICIANS AND HOSPITALS

Booth 32—Frank S. Betz Company, Hammond and New York, will have an exhibit in charge of Mr Karth and will display the latest line of aluminum X-ray Splints together with chrome plated instruments and special combinations of furniture. If visiting doctors will leave their names with Mr Karth he will see that our 1928 catalogue is sent them.

Booth 26—Cameron's Surgical Specialty Company, Chicago & New York Cameron's Electro-Diagnostoset will enable you to see many things without sending the patient to forty different men You have a lamp or instrument in the outfit for application in every phase of major and

minor diagnostic and surgical procedure. The lamps and instruments are out of your way, completely sterilizable, safe, always working and universally operate from battery and city current. Complete clinical demonstrations will be given daily

Booth 45—Campbell Electric Corp., New York

Physicians everywhere are refurnishing their offices with wood furniture. The modern physician's office should be free from all suggestive features. This is obtainable when furnished with Adams Period Furniture.

The Standard X-ray apparatus has been tested

CLUBS

on the market during the past year The items are too numerous to mention in this limited space, but prominent among them will be the Brady Operating light, Robertson carbon are lamp, infra-red unit, the Unger improved transfusion apparatus, Barton obstetric forceps, the Pitkin local anæsthesia outfit, Parker arthriflexometer, Smith tonsil tying forceps, Beilby goitre clamp, Nye tourniquet and Fisher stethoscope

Booth 34—United Surgical Supplies Corp. New York, will display a complete line of Surgical Instruments and Supplies, Physio-Therapy Equipment, and Surgical Diagnostic Specialities Among other new items they will show something radically different in an office examining and operating table, Carbon Arc Lamps, a new instrument for Colon Irrigation, and a new cautery and diagnostic light transformer

WATER

Booth 52—Kalak Water Company, New York, will again be represented with a suitable display and service on the exhibition floor Physicians in attendance who desire to maintain their alkali reserve to withstand the physical ravages consequent upon their strenuous activities at the meeting, will do well to call at the exhibit, as they can have all the Kalak Water they want to drink

Booth 21—Poland Spring Company, South Poland, Me —For over 70 years, Poland Water has enjoyed a reputation for therapeutic qualities,

especially in cases of nephritis. Such eminent authorities as Professor Amory Hare, Forcheimer and Osler, have recommended Poland Water in various works under their names, but it must be frankly conceded that it is extremely difficult to give a scientific explanation of these therapeutic qualities. Many other waters of international renown, labor under the same difficulty. The Poland Spring Company never relax its efforts to ascertain just why its water possesses certain virtues. It hopes that ere long they may solve the problem which has so far evaded solution.

Dr J C Walsh of the Jefferson County Sanatorium addressed the meeting on the "Tuberculosis Campaign, points of diagnosis with X-ray pictures and moving picture film"

In answer to a letter from Cattaraugus County which expressed dissatisfaction with the manner in which the Health Demonstration is being conducted by the Milbank Fund, the following resolution was passed

Resolved, that the Medical Society of the County of Jefferson holds that the interests of a community are best served when its health activities are under the direction of medical men, and therefore pledges its support to a state-wide platform for the control and direction in medical and health matters by the medical profession

Regarding the campaign for the early diagnosis of tuberculosis the following resolution was passed

Society Resolved, that the Medical of the County of Jefferson gives its unqualified endorsement to the Campaign now being carried on for the early diagnosis of tuberculosis by the National Tuberculosis Association through the activity of the Jefferson County Committee of that organization

Many of the members said that they thought this meeting had been one of the most interesting and instructive meetings that we have had in months

W S ATKINSON, Secretary

LIVINGSTON COUNTY MEDICAL SOCIETY

A regular meeting of the Livingston County Medical Society was held on Friday, March 9th, in Geneseo, New York

The scientific program consisted of a talk by Dr William I Dean of Rochester on "Infections of the hand" This paper was illustrated by interesting and instructive series of motion pictures

Drs H A Paterson and S Weingrow of the Laboratory Staff of Craig Colony presented a paper on "Some observations in connection with epilepsy and some of the diseases of childhood" The discussion was opened by Drs Wm T Shanahan, Medical Superintendent of Craig Colony (This paper will be published in this Journal)

Among the business matters that were acted upon at the meeting, the following resolution was adopted

Resolved, That it is the sense of this Society that we are opposed to any further legislation in regard to narcotics or with alterations of the present law

This Society also went on record as being

heartily in accord and endorsed the action of the Cattaraugus County Medical Society in its fight against lay interference with the care of public and personal health

The following resolution in regard to County Laboratory was unanimously adopted

Resolved, That the Livingston County Medical Society petition the Commissioner of Mental Hygiene to favor the arrangement whereby the County Laboratory work may be done at Craig Colony as the members of the Society are in need of County Laboratory service and the Craig Colony offers the only facilities available in the County

It was decided to enter into the nationwide antituberculosis campaign and in order to be adequately prepared for this a series of Post Graduate lectures on the diagnosis of early tuberculosis is to be arranged for in the near future

The meeting was well attended, about 80 per cent membership being present. One new member was elected

> LE GRAND A DAMON, Secretary-Treasurer

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at Eagle Palace, Jamaica, on Tuesday evening, January 31, 1928, at 8 30 P M The meeting was called to order by the retiring president, Dr Joseph S Thomas He introduced President, Dr Francis G Riley, who presided at the meeting

The following doctors were elected to mem-

Anchise A Cirillo, M.D., 11404 Newburg Street, St Albans, A Lopes Cardozo, MD, 10484 111th Street, Richmond Hill, Frederick Charles Courten, M.D., 9427 118th, Street, Richmond Hill, Giuseppe A W D'Andrea, M D, 10334 42nd Avenue, Corona, Benjamin Goldsmith, M D, 4206 159th Street, Flushing, Frederick C Hunt, M D, 4211 Kissena Boule-Parsons Boulevard, Jamaica, Charles W Waters, MD, Hollis Avenue and 215th Street, Queens Village

Associate Member Martin L Sowers, MD.

Crossways Apartments, Far Rockaway

NEWS NOTES

GRADUATE MEDICAL EDUCATION IN KINGS COUNTY

Graduate medical education in New York state is primarily in the hands of the County Medical Societies, but the Medical Society of the State of New York assists the county societies when their own facilities are insufficient to conduct effective courses. However, some counties such as New York, Erie and Kings, have the means for conducting not only their own courses, but also of assisting other counties in their projects.

The Medical Society of the County of Kings has arranged a course of instruction in the Kings County Hospital along the lines of a similar course given last September The Bulletin of the Medical Society of the County of Kings contains

the announcement by Dr Charles A Gordon, Chairman of the Joint Committee on Graduate Education of the Medical Society of the County of Kings and the Long Island College Hospital Medical College, that a seminar consisting of one week of intensive general medicine and surgical demonstrations will be given during the week of April 23 to 28, at the Kings County Hospital The fee for the course will be \$35, and luncheon will be served to those in attendance. The clinical material will be selected from such material as a general hospital of eighteen hundred beds affords

The daily program is shown in the following table

Hours	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
8	Gynecology	Surgery	Obstetries	Surgery	Medicine	Surgery
to 10	Dr Mills	Dr Rome	Dr Duncan	Dr Rome	DR PULLMAN DR CORWIN DR MERRILL	Dr Rome

NASSAU COUNTY

The regular monthly meeting of the Nassau County Medical Society was held on March 27, in the Surrogate's Court room, Mineola The following scientific program was carried out

1 "Therapeutic Abortion by Means of Deep X-ray Therapy," by N H Robin, M D, New York City Assistant Radiologist, Mt Sinai Hospital, Radiologist Nassau Hospital

2 "Current Topics in Pediatrics," by Miner C Hill, MD, Attending Pediatrician Bellevue Hospital, Consulting Pediatrician Nassau and Union County Community Hospital

Dr James E Sadlier, President of the Medical Society of the State of New York gave an address

complimenting the Nassau County Medical Society on its leadership in public health work, and setting forth the principles of the participation of the family doctors in the practice of civic medicine

Dr J S Lawrence, Executive Officer, spoke of the activities of the Committee on Legislation

The matter of establishing a county Laboratory was referred to the Public Health Committee

The plan for a permanent home for the So-

The plan for a permanent home for the Society was discussed

The coordination of outpatient clinics was also discussed

A D JAQUES, M D, Secretary

THE MEDICAL SOCIETY OF JEFFERSON COUNTY

At the regular monthly meeting of the Medical Society of Jefferson County, held at the Black River Valley Club, with forty members present, Dr S A Holling, Theresa, following

dinner, presented a paper on the "Anemias in General Practice with Demonstration of Cases and Microscopic Slides," which was very interesting "Some of the members have organized a dinner club which meets at 6 45 pm at the Whitman Hotel in Jamaica so as to give the guests a chance to practice after-dinner speaking before the regular lesson

"At the regular meetings of March 14th and March 21st, the following subjects were taken as topics for talks by various members of the class

"1 What is wrong with the practice of medicine today and how may it be corrected "2 How the medical profession can advantageously lead the campaigns for the improvement of the public health

"3 What the universal practice of periodic health examinations would mean to the medical

profession
"A Of what advantage

"4 Of what advantage is my membership in the County Medical Society?

"5 How the medical profession can protect the public from quacks and quackery"

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Castle Hall, on March 21, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the Chair

Election of candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following candidates for membership Harold R. Cronin, Nathan Solomon

Dr Rost, for the Committee on Hospitals, reported that it is the sense of the Committee that all hospitals should be partly open to all qualified practitioners of medicine with certain provisions, and recommending that letters be sent to the different Bronx hospitals asking for certain courtesies to the members of the Bronx County Medical Society. It was moved and carried that the Report be accepted

A Report was received from Dr Magid, Chairman of the Committee on Medical Economics, in regard to the subjects of counter-prescribing, and a plan of action to remedy the abuse of Medical Charity in Hospitals and Dispensaries It was moved and carried that the Report be referred to the Comitia Minora for consideration

Under New Business, the following Resolutions were introduced

"Whereas The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Eugene Monaghan, M D

"Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr Monaghan and that a minute thereof be placed on the records of the Society, and be it

"Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member"

The above Resolutions were carried by a rising

The Scientific Program proceeded as follows Presentation of Case "Purpura Hemorrhagica (Post-partum) Treated by Radiation—Six Years Duration." A. W. Jacobs

Duration," A. W Jacobs
Papers 1, "Studies in Normal and Pathologic
Physiology of the Bone Marrow," Herman L
Frosch, 2, "Purpuras in General," Ralph C Larrabee

The above Case and Papers were discussed by Drs Carl Goldmark, William Weinberger, H J Epstein, Ginsburg, Loeb and Gitlow

It was moved and carried that a vote of thanks be extended to the readers of the Papers and the gentlemen who discussed them

Respectfully, submitted,

I J LANDSMAN, M D, Secretary

LEGISLATIVE BULLETIN

The final bulletin of the Legislative Bureau of the Medical Society of the State of New York was issued on March 27th It described the results of legislation of the last session of the State Legislation which adjourned on March 22d.

The Bulletin gives the result of the action of the Legislature on 69 bills of special interest to the medical profession Fifty-seven of the bills died in committee, among them three chiropractic bills, an osteopathic bill and one on antivivisection Eleven bills were passed and now await the action of the Governor, but none were immical to the interests of the practicing physicians

It is especially to be regretted that the bill to establish a medical advisory committee to the State Industrial Council failed to pass because of faulty drafting. The only objectional point that was raised was that no appropriation was proposed for carrying out the provisions of the Act

By transfer John M Scannell, M D, 150-11 89th Avenue, Jamaica, from the Medical Society of the County of Kings, Vincent Tarabella, MD, 453 Boulevard, Astoria, from the Medical Society of the County of Kings

Dr Volts moved the adoption of the resolution offered by the Trustees at the last meeting relative to plans of a new building and the issuing of subscription bonds to meet the

expense of the same Motion carried

Reports were then received from the following committees Committee on Graduate Medical Education by Dr Mencken, Membership Committee by Dr Victor, Legislative Committee by Dr Thomas

Dr Flemming moved that the Society go on record as opposed to the Osteopathic bill now before the legislature Motion carried Flemming suggested that the Society give a function to the legislative representatives

Committee on Publicity by Dr Smith, Committee on Medical Economics by Dr Rohr

Scientific Session

Opening address by Dr Francis G Riley 2 Presidential address by Dr Joseph S Thomas on head injuries

3 Discussion by Drs Moss, McMahon, La-

velle, Voltz and closed by Dr Thomas

Dr Charles S Prest addressed the Society on the matter of public speaking and introduced Mr Dale Carnegie, who spoke to the Society on the importance of public speaking and the purpose of instruction. He offered to give a course of instructions covering 14 weeks at \$50 per pupil in a class of 40 mem-Dr Mencken moved that the matter of an organization of a class be left to the Committee on Medical Economics Seconded, passed

Dr Prest expressed the belief that half the expense would be met by the Queensboro Tuberculosis Association (See this Journal

March 15, page 346)

Adjourned Collation Attendance 91

E E SMITH, Secretary

A stated meeting of the Medical Society of the County of Queens was held at the Eagle Palace, Jamaica, February 28, 1928, president Dr F G Riley in the chair

The following physicians were elected to membership Philip H Finkelstein, MD,

107th Street, Richmond Hill, Robert Gowanter, MD, 4705 44th Street, Woodside, Andrew J Hesser, MD, 111-44 200th Street, Hollis, John Francis Lynch, MD, 6109 39th Avenue, Woodside, Frank R. Mazzola MD, 120-66 Lincoln Avenue, South Ozone Park, Michael W Mettenleiter, M D, 62 80th Street, Jackson Heights

The following reports of Committees were received Legislative Committee, by Dr Joseph S Thomas Committee on Publicity, by Dr E E Smith Committee on Public Health and Public Relations, by Dr E J Buxbaum Committee on Library, by Dr William J La-Trustees, by Dr T C Chalmers, who reported that preliminary to the formal requests for purchase of bonds for the new building, that \$66,360 had already been pledged Committee on Medical Economics,

by Dr L M Rohr

Dr Rohr moved in connection with the compensation insurance that the Society express themselves as favoring the free choice of physician by the injured Dr Thomas moved amendment that the Assemblymen of the County be informed that the Society favored the passage of Assembly, Introductory bill No 426 by Mr Coughlin, to amend section 13, Workmen's Compensation Law, by permitting the injured employee to recover as part of the Compensation reasonably expended by him for medical or other attendance. The amendment was accepted by Dr Rohr Dr Thomas moved to amend that it read, "That the Assemblymen" and Dr Chalmers moved to further amend to include notification to the State Senators This further amendment was accepted by Dr Rohr and the motion as amended was unanimously passed

Scientific Session

(a) Paper—"Clinical Significance of Auricular Fibrillation and Heart Block," by Dr Henry Joachim, Attending Physician, Long Island College Hospital

(b) Discussion by Drs Keet and Roettiger

and closed by Dr Joachim

(c) Paper—"The Practicing Physician in Court," by Dr L Howard Moss, President of the Society of Medical Jurisprudence.

Attendance 70

A collation was served at the close of the meeting

E E SMITH, Secretary

QUEENS COUNTY

The public speaking course conducted by the Queens County Medical Society is being conducted with success and satisfaction judging by the following extract from the March Bulletin of

"The Bulletin is glad to announce that the

course in public speaking is proving very popular and that those taking the course report that they are getting a great deal from it. The regular sessions of the class are held every Wednesday evening at 8 45 o'clock, at Community House, at 164th Street and Jamaica Avenue, Jamaica, N Y

THE DAILY PRESS

Ain't It a Grand and Colorious Feelin'?

By BRIGGS

RELIEF AT ANY COST

This cartoon from the New York Herald Tribune of March 27, 1928, tells a medical story in a manner whose forcefulness is in contrast to the triteness commonly found in health pictures

BEAUTY A NECESSITY

A lawsuit in London hinges on the answer to the question "Is beauty a necessity or a luxury?" The complaint is that a face manipulator claimed exclusive use of the slogan "Youthful appearance is a social necessity, not a luxury," and was suing another manipulator for infringing on his alleged rights. The Judge in his charge said. "A great many women who are not beautiful have become celebrated. Of course I am only speaking of those who are dead."

The New York Times of April 12, commenting editorially on the question said

"The Judge seemed to think that youth and beauty were not essential to social success. The

problem was expanded to include business and the professions. Prominent actresses were asked for their opinions. Some thought themselves unattractive, if their modest words are to be believed, and attributed their popularity on the stage to a dozen other factors—intelligence, hard work, luck, charm or personality. No men were consulted, and none volunteered. If they speak up, it is to be hoped that they will be as cautious as the Judge and confine their remarks to Cleopatra and Queen Elizabeth.

"Regularity of features and beauty of coloring are gifts of the gods not to be despised But certain irregularities and the freshness of good health

MEDICAL WARES

TOOTH PASTE

The tooth brush is the peculiar armament of civilization in the fight for the cause of health, and tooth paste is its ammunition

The mouth is an incubator, favorably adapted by its temperature and culture media for the growth of bacteria and mold. The resulting fermentation produces its most evident effects on the teeth and tongue. Caries and pyorrhea are the results of bacterial growth, while a coated tongue, formerly considered to be the result or the symptom of a derangement of the liver and other internal organs, may be the source of toxins which produce general sickness.

Cleanliness not only of the teeth, but also of the entire mouth, is a necessary health measure that is even more potent than cleanliness of the face and hands. Fortunately the same measures and methods that are used in cleansing the teeth are also the best ones for cleaning the entire mouth. The principles of cleaning the teeth apply equally well to cleansing the tongue, the gums, and the cheeks

Investigation by the Mellon Institute of Industrial Research and the University of Pittsburgh School of Dentistry has shown that the immediate cause of dental caries is lactic acid, which is a product of fermentation. If fermentation could be prevented, or the lactic acid neutralized, the teeth would not decay Tooth pastes therefore have three theoretical objects (1) the neutralization of lactic acid, (2) the prevention of fermentation, and (3) cleanliness The greatest of these are cleanliness and neutralization, for the brush cannot reach between the teeth or the acid lying in minute fissures in the teeth, no known antiseptic is harmless to the mouth, and yet at the same time is potent to kill bacteria, but cleanliness romoves, and neutralization eliminates, the harmful substances as fast as they are formed

The first tooth cleansers had soap as their base, on the theory that what would cleanse the skin would cleanse the teeth also Sozodont and rubifoam, widely advertised years ago, were liquid soaps, while many of the tooth powders which followed the liquid preparations contained powdered soap

The substance which entangles and holds dirt and bacteria in the mouth is not grease, as on the skin, but it is mucin, which is not affected by soap. Mucin is precipitated by weak acids, such as the carbon dioxide of the breath, and forms a protective coating on the teeth, tongue, and cheeks, which is desirable unless it is in excessive quantity.

An excess of mucin promotes fermentation and decay by holding the bacteria and culture media in the mouth beneath a gelatinous coating which is not readily removed by the ordinary processes of eating

Mucin is insoluble in acids. When vinegar or cour orange juice is held in the mouth for some time, the protective coating of mucin normally on teeth is penetrated by dialysis. Strong acids penetrate this mucin coating more rapidly, thereby quickly setting the teeth "on edge". All acids attack the tooth structure when they come in direct contact with it and are therefore undesirable in tooth paste.

Weak alkalies dissolve mucin and are the bases of standard tooth pastes. Anyone may demonstrate the affects of an alkali by brushing the tongue and teeth with plain water, and then repeating the process with a sodamint tablet, and noting the amount of thick mucus which will be loosed and removed when the alkali is used

The ideal alkali for a tooth paste is one which will neutralize a maximum amount of lactic acid, will act generally to loosen the mucus, and will have a pleasant taste and effect in the mouth. These conditions are most nearly met by magnesium hydroxide, which is the essential constituent of milk of magnesia. Sodium bicarbonate being an alkaline salt rather than an alkali hydroxide, is not sufficiently effective to protect the calcium of the teeth against the lactic acid, but the affinity of the acid for magnesium hydroxide is greater than that for the lime of the teeth. Moreover, the magnesium is insoluble and lodges in cracks and fissures where it will best protect the teeth.

The second desirable constituent of a tooth paste is a substance which will polish the teeth. It is undesirable to use a hard abrasive, such as powdered pumice, cuttle-fish bone, or calcium phosphate. The constant use of such abrasives may grind away the teeth at the gum line. The standard polishing substance is carbonate of calcium in the form of powdered chalk.

Tooth pastes usually contain coloring matter, and also flavorings, especially oils of wintergreen and peppermint which leave a cooling taste in the mouth

Advertisers of tooth paste stress the point of beautifying the teeth, for the appeal of beauty is stronger than that for hygiene. However, tooth pastes are as essential as soap in the promotion of health, and afford an example of a cosmetic urge resulting in health as well as beauty.

BOOK REVIEWS

INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A.M., M.D., Thirty-seventh Series, Volume III Octavo of 311 pages, with illustrations Philadelphia and London, J. B. Lippincott Company, 1927

This issue of the International Clinics provides an attractive menu for epicurean readers. A battery of twenty distinguished contributors serves the courses, consisting of ten papers on diagnosis and treatment, one on medicine, one on surgery, one on obstetrics, one on neurology, one on medical history and two on post-graduate study The record of this publication for spreading good reading feasts before its subscribers is duly sustained.

MEDICAL ORGANIZATION AND MEDICAL BIOGRAPHY OF SENECA COUNTY, New YORK. Compiled by Lester W Bellows, M D Octavo of 429 pages West Henrietta, New York, Manzler Publishing Corporation, 1926

"Medical Organization and Medical Biography of Seneca County, New York" is a detailed and precise compilation, by Dr Lester W Bellows, of data on the organization and development of the Seneca County Medical Society, the lives of the physicians of that county, and historical sketches of the Willard State Hospital, Seneca Falls Hospital and Waterloo Memorial Hospital

The book is purely of local interest and yet of general medical historical value because of its brief sketches of some of the pioneers of medicine in the United State
William Rachlin

SHOULD WE BE VACCINATED? A Survey of the Controversy in its Historical and Scientific Aspects By Bernhard J Stern 12mo of 146 pages New York and London, Harper and Brothers, 1927 Cloth, \$1 50

This little book is an interesting survey of the factors which underlie the controversy over the subject of vac-

cination against small pox

The author who is an instructor in sociology at Columbia University, devotes the greater portion of his book to a careful study of the history of the question showing the relation of sociological and psychological forces in the development of the controvers. The book gives a fair hearing to both sides, and brings forward enough proof of the beneficence of vaccination to convince any open minded investigator. It is a good book for the lasty and a useful weapon for the profession to consult in dealing with the anti-vaccinationists JOSEPH C. REGAN

THERAPEUTIC MALARIA By G DE M RUDOLF, MRCS LRCP Octavo of 223 pages, illustrated London and New York Oxford University Press, 1927 Cloth, \$385 (Oxford Medical Publications)

This little volume provides an excellent resume—the first to appear in English, we believe—of the present status of the malaria treatment of neurosyphilis-in particular of course, general paralysis, since it is hardly possible to dispute the author's statement that this is the disease that has been most successfully treated by the artificial inoculation of malaria." To the reby the artificial inoculation of malaria." viewer it appears that every aspect of this mode of therapy has been dealt with by the author, that every one of the multifarious topics related to the general procedure has received at least some consideration. To find room for the large mass of detailed observations of the most varied and miscellaneous sort which have found expression in the rather extensive literature of the subject which has grown up since 1919, has been no small feat of systematic arrangement and presentation. This

the author has been successful in accomplishing, marshalling the opinions to be found in the literature upon each topic as presented, and drawing upon his personal experience where that has been apposite. The reader will find in this volume, which is provided with a very representative bibliography and an index, an entirely adequate survey of the subject of the malaria treatment HENRY A. BUNKER, IR. of general paralysis

THE NEW MEDICAL FOLLIES BY MORRIS FISHBEIN, M.D. 12mo of 235 pages New York, Bom and Liveright, 1927 Cloth, \$200

In The New Medical Follies, Doctor Fishbein, again, gives us a delightful opportimity to relax and romp with him through 235 pages of facts regarding the isms, fakes, nuts, and quacks, who, like the poor, are ever with us

Doctor Fishbein is in his best vein when he goes on a mental holiday and plys his avocation, for, surely, it cannot be work for him to yield his pen or pound his

typewriter at this task.

The book starts off with An Encyclopedia of Cults and Quackeries There follows in order chapters on The Cult of Beauty, The Craze for Reduction, Rejuvenation, Rejuvenation The Mechanical and Glandular Methods, Bread and Some Dietary Fads, The End of Electricism, Physical and Electric Therapy, Psychoanalysis-A Cult-Ethics-Medical and Otherwise, ist Movement? The Physician of the Future

This work is delightful reading and is recommended to layman and physician.

CLINICAL PHYSIOLOGY (A Symptom Analysis) IN RE-LATION TO MODERN DIAGNOSIS AND TREATMENT A text for Practitioners and Senior Students of Medi-cine. By Robert John Stewart McDowell, D.Sc., M. B. With an introduction by W. D. Halliburton, LLD., F.R.C.P. Octavo of 383 pages, illustrated New York, D Appleton and Company, 1927

This book emphasizes the importance of the physiological point of view in clinical medicine, the importance of which, although obvious, would nevertheless seem to require to be emphasized. The book is rich in its contents, but does not, of course, attempt anything like a complete presentation of physiology, nor of clinical medicine, it "is an attempt to present some of the facts of physiology and their application in general medicine of physiology and then application in general including in a form which fits in conveniently with pathological and clinical teaching. It is not too much to say that students of medicine of all ages and degrees can get pleasure and profit from reading this book. E. E. C.

APPLIED BIOCHEMISTRY By WITHROW MORSE, Ph D 2nd Edition, revised Octavo of 988 pages, with 272 illustrations Philadelphia and London W B Saunders Company, 1927 Cloth, \$700

When the first edition of this book appeared it im-When the first edition of this book appearance by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the interest of the reviewer by the mediately captured the mediately captured the interest of the reviewer by the mediately captured the medi novel, clear and readable manner of presentation. This second edition maintains this same delightful style. In addition it adds the very latest material available on the

The carnest attempt of the authors to bring this work up to the minute is seen in their discussion of "synthalin". This substance is still comparatively unknown and even at present there is only an occasional reference to it in the current literature. Still the authors managed to include it in their book. This is an index of how well they succeeded in keeping at the very front of a rapidly advancing subject. We tender our gratitude and our congratulations BENJAMIN DAVIDSON

may be equally charming and possibly more piquant. If, as one London society leader said, it is a duty to one's fellow-creatures to look young

and handsome as long as one can, it is equally important to the community with the good looks on a foundation of sturdy well-being"

RESPONSIBILITY FOR NURSING SERVICE

The New York Sun of February 17 describes a legal case which has some medical bearing, for it involves the question of responsibility for nursing service. The case was as follows

"A steamship sent a sick person to a hospital in New York City The hospital authorities found the patient required two special male nurses, and with the sanction of the steamship company engaged them through a nurses' agency, the hospital to pay them and the steamship company to reimburse it. At the request of a hospital attaché one of these nurses sewed up certain incisions in the patient's body In so doing he pricked his index finger with the needle and infection caused loss of 70 per cent of the member The Industrial Board awarded compensation to the nurse against the hospital and its insurance carrier, the hospital having taken out compensation insurance upon its employees

"Upon appeal the hospital and its carrier

contended that as a graduate nurse the injured man was not an employee of the hospital. They argued that he was an independent contractor or that, if an employee, he was an employee of the steamship company. They held that his suturing of the incisions was a voluntary compliance with a request and was not in the line of his duties.

"The Appellate Division held that the hospital had been merely the agent of the steamship company for procuring the nurse. It cited decisions to support its judgment to the effect that the relation of employer and employee does not exist between a hospital and a special nurse. It reversed the award and dismissed the claim."

This case is referred to the delegation of the Medical Society of the State of New York for discussion in the smoking apartment while the doctors are en route to the Minneapolis meeting of the A M A

FACE LIFTING

Plastic surgery is being perverted to a surprising extent by those who pose as skilled "specialists" in reconstructive surgery. Even magazines of otherwise high class fall for the seductive promises of professional beautifiers. A recent number of a general magazine of a large circulation carried a misleading article on face lifting which may be summarized as follows.

"Esthetic surgery (face lifting) is accepted by the medical profession as a legitimate specialty. The operation is done under local anesthetic and is not followed by pain. The patient goes home at once, and after two or three days, she goes out protected by a brimmed hat, and a veil. There is no danger or pain in the operation. The only risk is that of producing a flatness of the face and a vacancy of expression for a time. The operation may have to be repeated in five years."

The medical point of view is that esthetic surgery is not an approved specialty. The permission that the patient may go home immediately after the operation involves a risk that a conscientious surgeon would be unwilling to take, however, if the patient goes home and if things go wrong, the esthetic surgeon has the alibi that the patient had not taken proper care of her face.

It is well known that wounds of the head heal more rapidly and with less risk than those of any other part of the body. The danger of infection is comparatively small and even a clumsy surgeon can cut a gore out of the skin and sew it together in such a way that the stretching flattens the folds. But physicians cannot agree that esthetic surgery is devoid of danger or that it is a legitimate specialty in surgery or that it may be practiced safely by anyone besides a trained surgeon.

Free from the unpalatable qualities of plain cod liver oil Maltine with cod liver oil

is an antirachitic –a

food

MALTINE With Cod Liver Oil is an effective agent in preventing rickets, and it also has the food value of malt, maltose, dextrose and dextrin Thirty per cent of this preparation is cod liver oil Seventy per cent of it is a concentrated extract of barley, wheat and oats and their mineral salts

Children respond to the health-building properties of this pure, dependable product. It is readily digested and it is much more palatable than plain cod liver oil

WOMEN IN HEALTH PROGRAMS

The Atlantic Medical Journal for February contains the report of an address given on October 5, 1927, by Mrs George H Hoxie of Kansas City, Mo, before the Woman's Auxiliary of the Medical Society of the State of Pennsylvania Mrs Hoxie is Vice-President and Chairman of Health Education of the Woman's Auxiliary of the American Medical 'Association—Editor's note

I have been working fifteen years with lay women's organizations which do or try to do health work on their own initiative and under lay direction, and I have come to the conclusion that the average women's club gets but meager and unsatisfactory results from its efforts,—results in no sense in proportion to the time, strength, money and enthusiasm that are put into

There are two causes for this Most lay workers have no knowledge of the enormous field of * health work, they have no notion of what constitutes a complete, well-rounded health program for their community They often become so immersed in their own specific work that, having no sense of perspective, they have no sympathy with other lines of work as important, perhaps more fundamental, than their own For the most part they concentrate on child-welfare work, be-But where fifty cause of its emotional appeal women can be induced to run well-baby stations (where the real work is done without pay by the doctors, and the women get the thrill) there may be difficulty in finding one who can be interested in sanitary waste disposal, decent housing conditions, and safe milk

To illustrate what I mean I have seen a well-children's clinic conducted within a block of a contaminated spring with a history of several typhoid cases, which the children passed and drank from on their way between the clinic and their homes, which were in dilapidated, ramshackle buildings having no connection for city water, no connections with city sewers, and where the surface privies were open to wind and flies And yet it was impossible to interest the women running the clinic in improving sanitation in the district. They were seemingly blind to the fact that upon fundamental changes in living conditions in the neighborhood depended the success of their own work.

The second cause I believe to be that women, in their health tasks, undertake work for which they have no training. Work of health promotion and disease prevention is technical, scientific work, and when it is done without the direction

of trained people it is amateurish work and can have but amateurish results

If we accept these two things as causes of much of the inefficiency of the health work of the ordinary club, our course is clear Four steps we must be willing to take

First, we must get a picture of the great field of public-health work, including the control of such problems as waste disposal, pure water, safe milk, flies, dust, housing (problems which, under urban conditions of life, the individual can not solve, for the solution of which he must look to the technically trained public-health expert, problems which, under rural conditions, must be solved largely by the individual home owner under the guidance of a trained official)

Second, we must get a vision of that other great field of health work, personal hygiene, which involves the training of people to better habits of life, teaching, prenatal care of children, proper food, rest, recreation, and the like, for which people need the guidance of the scientific physician—all that broad field in which the safety and well-being of the individual depends upon the periodic contact with the skilled physician and such confidence in his modern scientific training as to create a willingness to follow his advice about daily living, as well as about treatment when disease is already present.

Third, having got an idea of what these two great fields of health include, we should find out what official machinery experience has shown to be best adapted to developing in cities, towns, and rural districts good sanitation, prevention of communicable disease, and better personal hyperene

And fourth, we should study the official health machinery which does exist and which is or is not functioning successfully in our own state, our own county, our own township, our own city

In other words, the first task of the state auxiliary board is to study its state health conditions and the state health department and its work, and to induce each county auxiliary to undertake similar work, ending with such a study also of its own county

What more logical or fundamental work could a county auxiliary do than to study state conditions, as we had done, study their county statistics as compared with the state averages and the statistics of other counties, get the theory of he county health unit, its organization, its work, its cost, make a survey of the official and volunteer work being done in their county, and then call

(Continued on page 471-adv xvn)

(Continued from page 468)

upon the state health department for help in planning and carrying out educational work which would lead up to a widespread demand from the citizens for a full-time county health department? With the state health department eager for cooperation from the women of the state, why think up things to do on our own initiative? Why not confine ourselves to work under the direction of that department? And this became our state program

This program once decided upon, the work of the state chairman of education began came her task to induce county auxiliaries to arrange study programs for their meetings success was due to two things her willingness to work, and her recognition of the fact that many rural doctors' wives are unable to prepare papers because of lack of reference libraries She, therefore, wrote some papers, collected others, listed articles in the Journal of the American Medical Association and in Hygeia, and offered to supply educational material for county auxiliary meetings

This type of work led inevitably to contact between the county auxiliary and the state health department Further, the following year an auxiliary member working as health committee chairman in the State Federation of Women's Clubs carried this program over into that organization, and a year later another auxiliary member carned a part of it into the State Parent-Teacher Association As a result, in addition to the general health education being carried on in many counties, these three organizations—the Auxiliary, the Federation of Clubs, and the Parent-Teacher Association—have been working on two tasks assigned them by the State Health Department. first, a month's state-wide intensive educational campaign for birth registration, which was done by committees composed of members of the three organizations in each county, and second a "Six-Point Child" campaign by counties started in the fall of 1926, and to be continued indefinitely

INTRACRANIAL HEMORRHAGE IN THE NEWBORN

The March issue of California and Western Medicine contains a brief article by Dr M H Silverberg of San Francisco, on intracranial hemorrhage in the newborn, from which the following quotations are taken -Editor's note

Intracranial hemorrhage in the newborn is the most frequent and fatal injury of childbirth The incidence is high ranging from 5 to 15 per cent, with a mortality of from 40 to 50 per cent

At Mount Zion Hospital, during the year

The Battle Creek Super Solar Arc Lamp

For Heat, Light and Ultra-violet Therapy

THE new Battle Creek Super Solar Arc Lamp is unique in the field of Phototherapy appliances. It is the result of our own 40 years experience as pioneers in the production of therapeutic arc lamps in this country.

Many advanced features of construction make the new Battle Creek Super Solar Arc Lamp noteworthy A snap of the switch starts the arc burning at full power No time is lost in waiting for the rays to attain adequate intensity The lamp being automatically adjusted by magnetic feed, the largest are possible with the given current is always maintained.

A specially constructed adapter is furnished with the lamp It is designed so that the arc does not heat the applicators Any standard quartz applicator may be attached

By giving off rays in both the infra red and ultra violet the Super Solar Arc may be used to successfully treat a wide range of diseases. The technic of handling it is easily mastered Various spectra are instantly obtainable by the use of different carbons.

We have recently prepared a new bulletin which describes fully the many advantages of the new Super Solar Ast Lamp May we send you a copy?

Sanitarium & Hospital Equipment Co. Battle Creek Michigan

Battle Creek Therapeutic Appliances Include

Hydrotherapy Apparatus— Type G 3

The Battle Creek Hydrotherapy Apparatus is constructed through out of high quality brass. The appliance has wall type control and grees jet, rain or shower perineal needle spray and Scorch douches Electric Light Bath Cabinets

Three models varying in size and cost Each cabinet complete with special comfort chair and necessary bulbs Made of the finest hard wood water proof cemented

The Battle Creek Radiant Baker

A tested appliance for heat application. The Baker is constructed of alumnium and asbestos and equipped with safety rheostat to prevent excessive heating.

The Battle Creek Treatment Photophore

A most efficient appliance for making local applications of heat. It combines the essentials of many expensive therapeout lamps in one simple effective appliance

(Continued from page 472-adv xvni)

Conclusions—1 Intracranial hemorrhage occurs very frequently, from 5 to 15 per cent in the newborn, during or immediately after delivery, and shows a high mortality

2 It occurs in normal as well as in abnormal deliveries, and is frequently overlooked. This condition occurs most in premature, breech

extraction, and in precipitate labors

3 The treatment is one of prevention

Prophylactic measures during labor and delivery should be instituted

4 Whole blood from a healthy robust donor given intramuscularly in doses of 20 to 30 cc (which may be repeated every eight hours if necessary) to any newborn child showing symptoms of intracranial hemorrhage, gives the quickest and best results

PELLAGRA IN ARKANSAS

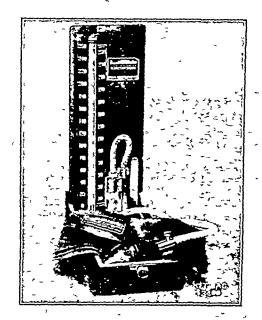

Dr Harvey S Thatcher, from the Department of Pathology, University of Arkansas School of Medicine, contributes the following article on pellagra to the March issue of the Journal of the Arkansas Medical Society—Editor's note

During the year 1927, a noticeable increase of pellagra was observed in Arkansas Arkansas State Hospital for Nervous Diseases reported 70 cases during 1926 and 123 cases in 1927 The clinic of the University of Arkansas School of Medicine reported 8 cases during 1926 from April 1st to November 1st, inclusive, and 30 cases during 1927 for the same period As these institutions received patients from various parts of the State, it is indicative that pellagra had increased. A more detailed study was made by the co-operation of the American Red Cross in Pulaski County working with the refugees in the flood-stricken area The American Red Cross reported 102 cases to November 1, 1927, 75 of which were acute and 22 of which were chronic in the flooded district in this county Five of the acute cases died The diagnoses of these pellagrins, except those which died, were confirmed

Relief work was begun in Pulaski County by the American Red Cross, April 15, 1927 The work for pellagrins began August 1, 1927 The number of refugees during the emergency was approximately 12,000 and the number of families applying for relief was 4,647. This county has a population of 145,000, which is about one-fourteenth of the population of the State.

A careful examination of the diet was made before and after the flood. The diet consisted mainly of salt meat, dried beans and syrup, which was decreased after the disaster. Dr. Paul L. Day of the Department of Chemistry,

1916-1928

YEAR after year, more Baumanometers go into service than all other mercury types combined,

—for although it is not in any sense a cheap instrument, experience shows that it actually costs less in the long run.

The Baumanometer is, moreover, the only instrument in all of the world whose glass tube is gnaranteed against breakage.

And for accurate bloodpressure readings—ten times ten thousand users will tell you it is unfailingly reliable.

Michigan

NEW YORK 330 Fifth Ave. CHICAGO 59 E. Madison

(Continued from page 471, adv xvii)

from July 1, 1925, to July 1, 1926, in 138 clinic cases delivered on the obstetrical service, we had an incidence of 43 per cent. This incidence is quite low, but several babies having no symptoms may have been overlooked in this series, as spinal punctures were not done.

Causes—Intracranial hemorrhage in the newborn may occur during or after normal labors, only exhibiting symptoms in the severe cases

It is frequently overlooked

The chief cause is trauma The main pre-

disposing causes are

1 Prematurity of the infant, which renders it more sensitive to trauma, so that normal labors may be sufficient to cause hemorrhage.

2 Breech extraction, in which rapid or forceful delivery of the aftercoming head produces the injury

3 Precipitate labors, where there is sudden

compression of the head

4 Very difficult or prolonged labors, where there is excessive molding of the head with mury

5 Instrumental deliveries

The most frequent site of hemorrhage is in the free margin of the tentorium (usually at the juncture with the falx cerebri) with result-

ing rupture of the venous sinuses

The diagnosis is readily made when the newborn shows drowsiness, stupor, cyanosis, difficult breathing, focal signs as twitchings, poor tissue turgor, refusal to nurse, and the general symptoms of increased intracranial pressure, as separation and bulging of the cranial sutures and the fontanelles and tonic or clonic con-Early lumbar puncture is an acvulsions The coagulation curate means of diagnosis time and bleeding time should be done immediately after delivery in all cases of difficult labors or suspected hemorrhage The coagulation time in normal newborn babies is from five to nine minutes with an average of seven The bleeding time is from two to minutes five minutes with an average of three and one-Increased coagulation time or half minutes hemorrhagic disease of the newborn is one of the chief contributory factors in serious intracranial hemorrhages

As soon as there is even the slightest suspicion of intracranial hemorrhage, one should administer 20 to 30 cc whole blood intramuscularly. This may be repeated every eight hours if necessary (Large amounts of whole blood intramuscularly give the best results). Horse serum and thromboplastin have been used, but whole blood gives the quickest and best results. Where the intracranial pressure is pronounced and the symptoms fail to subside, spinal punctures should be performed to relieve the pressure

(Continued from page 474, adv rx)

 τ_{ϵ} physician reported seven cases of cholera to - council, five of which were fatal g - doctors attempted to quiet public apprehenn by the opinion that the malady was only a lent form of the cholera morbus, and the mes "felt confident that there was very little inger, and had not heard of a single case where e patient had not been previously reduced by "irrhœa"

The only reliable account extant was written Dr John F Morse, ten years afterward, for Diville's Directory Doctor Morse was one of e most active and humane physicians during the evalence of the calamity, and parts of his nartive are almost too shocking for transcription the, but no one who ever knew that good man all think of calling in question his credibility, zow that he, too, has passed away

In six days from the time of its inception it as making such progress that regular burials Fere but slightly attended to and nursing and ttendance were not unfrequently entirely over-Joked Money could scarcely buy the offices of ommon kindness, and affections were so neuralized by the conflicting elements of selfishness hat but little could be done to arrest the course of the disease The victims of the malady did not seem to be confined so much to those of inremperate and irregular habits, as had been the case in almost all previous manifestations of the , isease

As soon as the daily mortality became so great as to keep men constantly employed in carrying away the dead, the citizens began to leave the -town in every direction, and in such numbers as to soon diminish the population to not more than one-fifth of its ordinary standards. In this pestilential reign of terror and dismay the most dreadful abandonments of relatives and friends Those who were willing to forget took place self and become the visitants of mercy constituted but a small and meager proportion of the many, who, following the instincts of nature, sought only to preserve themselves There were a few men, as there always will be, whose warm hearts throbbed with an uncontrollable anxiety to convey relief to the distressed and the dying, and who lingered around the death scenes of the epidemic, so spellbound by sympathy that they endured anything and everything as long as there remained a solitary hope of even palliating the agony of dissolving nature

I will mention one name, the motive for which will be readily acknowledged more as the extortion of truth than the result of partisan partiality-that of John Bigler, the present Governor This man, with strong impulses of of California sympathy, could be seen in every refuge of distress that concealed the miseries of the dving and the destitute With a lump of gum camphor

University of Arkansas School of Medicine, estimated the Vitamine B content in the dut of the acute cases which developed after the flood

Although the table represents only an approximation of the Vitamine B content of the diet, it is apparent that a large percentage of diets had this deficiency. It is also eviden that the other vitamines, as well as calcium, an lacking in the diets. The gardens were destroyed by the inundation, hence these pellagrins did not have the fresh vegetables in the markedly decreased food supply

The etiology of pellagra is obscure. Job ling and Peterson have stated that pellagra practically a disease of the unsewered area There was no sewage on the plantations when the pellagrins in the above series were studie The majority of the patients reviewed by Jol ling and Peterson had their onset during Jur and July The majority in this county hat the onset during May The dietary, or the infectious theory for the cause of pellagra hi not been definitely determined ological anatomy indicates a toxic or an ii Goldberger has recent agent stated, it is probable that a pellagra-producing diet practically always contains some of th "P-P" Vitamine, but the quantity is not enoug for the nutritional needs of some or all i these subsisting on it If this statement we correct more of the refugees would have d Pellagra did not occi veloped the disease during Civil War history or among the pi neers, and surely the diet was not rich vitamines in those periods Diet has some thing to do with the cure of the disease an probably has something to do with its caus but further search must be made for some other etiological factor

CHOLERA IN SACRAMENTO IN 1850

The March issue of California and Wester Medicine contains a description of cholera in Sacramento, California, in the year in which the State was about to be admitted into the Union The following abstracts from the article indicate the justifiable fear which the epidemic inspired—Editor's note

The cholera made its first appearance in Sac ramento on the 20th of October, 1850, when a immigrant by sea was found on the levee, in the collapsing stage of the disease

As usual in such cases the local papers endeav ored to conceal the extent of mortality, and then files of that date give no adequate idea of the fearful scourge On the 24th of October, the

THE OHIO ANNUAL MEETING

The annual meeting of the Ohio State Medical association will be held in Cincinnati, from Tuesay to Thursday, May 1-3, 1928, and its program fill be of interest to the physicians of New York state, since they are planning for their annual neeting which will be held three weeks later. The him State Medical Journal for April describes he meeting in the following editorial—Editor's cate.

All plans and preparations for the forthcoming 32nd annual meeting of the Ohio State Medical Association, Tuesday, Wednesday and Thursday, Way 1, 2 and 3, point to the establishment of a new record in attendance and interest.

Unofficially, the meeting opens Monday morning, April 30, with clinics and the eighth annual golf tournament. The golf tournament lasts throughout the day and terminates with a banquet when the various prizes are awarded. Both medical and surgical clinics will be held at the various Cincinnati hospitals. Monday morning Schedules for these clinics will be found posted on the bulletin boards of the various hotels as rearly as Sunday noon, April 29

Tuesday morning, May 1, the eighty-second annual meeting officially opens with the first general session in the ballroom of the Hotel Gibson. This will be immediately followed by the first

meeting of the House of Delegates The afternoon of the first day will be devoted entirely to the scientific programs of the six sections. All of these will be held in the Hotel Gibson. The second general session will be held Wednesday evening, when Dr. L. Bigelow, Columbus, president and Dr. Charles W. Stone, Cleveland, president-elect, will deliver the annual addresses Following this, an informal reception will be held in their honor.

The second day of the Meeting, Wednesday, is opened with the six section meetings scientific programs will take up all of the morning hours At noon, an organization luncheon will be held in the Italian room for the officers and legislative and medical defense committeemen of the various county medical societies At 1 30 P M, the second and last session of the House of Delegates will convene. During this session, resolutions introduced will be considered. officers for the coming year elected, and the place for the next annual meeting selected same time, a motion picture on malaria will be shown At 3 P M Wednesday, the annual orations will be given by Dr John H Stokes, Philadelphia, and Dr Palmer Findley, Omaha the general session Wednesday evening, the eco-

(Continued from page 475, adv xxi)
now in his pocket and anon at his nostrile
braved every scene of danger that presented,
with his own hands administered relief to
suffering and uncared for fellow beings

The rapid spreading of the epidemic gave the physicians of the city no rest day or me As might be expected, they were falling like foremost soldiers of a desperate charge, and the cholera had subsided, seventeen of their ber were deposited in the Sandhill Cemeter our city. A professional mortality never be known, an inroad of death from which in fraction more than two in three escaped life, and not one in three from the diseasely yet, not a single educated physician turned back upon the city in its distress and threate destruction

This awful calamity lasted in its malig form only about twenty days. In the latter of the epidemic the authorities procured the of a large frame building on L. Street, where destitute cholera subjects were taken and vided for. The abatement of the disease much longer than the period of its inception increase, and commenced just as soon as the quency of death had familiarized people with frightful scenes around them, and rendered these defenseless from a paralyzing fear.

GRADUATE MEDICAL EDUCATION MISSOURI

New York is by no means the only State whe Medical Society conducts graduate medical ecation. The plan of the Missouri State Med Association is discussed in its Journal of A first in the following editorial—Editor's Note

The Postgraduate Committee invites the cocilors and county societies to take advantage the facilities the Association has established providing speakers at the meetings of the soties and councilor districts. The committee well prepared to send speakers on any topic to the members may desire to hear discussed as has a large list of members who are willing give their time to this activity. In making quests for speakers the committee should be give at least thirty days in which to make arrangements. If a special subject is desired this should be named and either the speaker mentioned left to the committee to select.

Societies are requested to make a special effortion toward obtaining a good audience for the gentlemen who are sent to them by the Postgradua Committee. This is a courtesy due the speake and we know from reports of meetings alread held that members have felt well repaid for the effort of attending the meetings. Requests for speakers may be addressed to the Chairman of the Committee, Dr. R. L. Thompson, University Club Building, St. Louis, or to the Secretary of the Association, 901 Missouri Building, St. Louis

MEDICAL PARAGRAPHS

The Nebraska State Medical Journal runs a department of editorial paragraphs The following are taken from the April issue—Editor's note

A number of cases of Malta fever are reported to have occurred

ın lowa.

Attending medical meetings is good business. It makes a better, broader and happier man

Sir Arthur Conan Doyle, famous novelist, is a physician, graduate of Edinburgh University

Doctor Take the *Journal* home to your wife She will appreciate it, whether you do or not.

The first hospital in America was erected before 1524 in Mexico City by Cortes It is still in existence

At the beginning of the Revolutionary War we are said to have had one medical book by an American author, three reprints and about twenty pamphlets

Dr John M Dodson is said to have figured out that doctors live the longest average lives, and some one rises to ask whether it is because they take their own medicine

A generation ago a Chinese quack named "Dr C Gee Woo" operated in Omaha "C Gee Woo" was recently fined \$500 in Portland, Oregon, for practicing without a license

Wonder if it is not just a little bit disgraceful for a medical man who should know enough to have his family immunized, to have diphtheria break out among the children of his own family?

Our most recent ex-president, Dr H E Potter, Fairbury, is a candidate for delegate to the Republican National Convention. It is a hopeful sign that some of our foremost medical men take an interest in politics.

nomic and social aspects of medicine will be discussed by able speakers

The eighty-second annual meeting closes Thurs day noon at the termination of the last general scientific session under the joint auspices of the medical and surgical sections, at which Dr J J R Macleod, Toronto, and Dr J Shelton Horsley, Richmond, will be the speakers

More than one hundred Ohio physicians and six out-of-state speakers take part in the program.

An unusually fine exhibit is also promised for this year Most of the exhibit space has been reserved These will be worthwhile to every physician

Another part of the JOURNAL carries the de tailed program of the scientific sections. An excellent feature of this program is the abstracts of the papers

HEALTH LECTURES IN NEBRASKA

The Nebraska State Medical Journal for April has the following editorial describing how one county medical society provides popular speakers on medical topics—Editor's note

"Those interested in medical organization take a measure of pride in the constructive work of the organized units of the state. The Omaha-Douglas County Medical Society is one of the units doing things. Recently arrangements were made by the educational committee to create a speaker's bureau and make it function in a smooth and orderly manner and a schedule of topics to be discussed by the speakers has been arranged. The following will give an idea of the plan outlined.

"'1 Members of the Omaha-Douglas County Medical Society whose addresses have been au thorized by the educational committee shall constitute the speakers' bureau of the Omaha-Dougles County Medical Society

"'2 An outline of any proposed addresses shall be presented to the educational committee for approval, such outlines to consist of between two hundred and two hundred and fifty words

"'3 The subject matter of these addresses is to consist of scientific information of interest to the lay public and is to be impersonally presented In general, controversial matters must be avoided

"'4 Talks authorized by the educational committee may be prefaced by a statement to that effect'

"The topics to be discussed include under Infancy, 9, School Age, 10, Adolescence, Boys, 8, Adolescence, Girls, 4, Girlhood to Womanhood, 6, Adult Life Men 4, Adult Life, Women, 9, General topics, 27"

MEDICAL SOCIETY OF THE STATE OF NEW YORK ANNUAL REPORTS

REPORT OF THE PRESIDENT

To the House of Delegates—Gentlemen

Introductory

In reviewing the many activities of the Medical Society of the State of New York for the year which is now drawing to a close, may I suggest that it has been a period of definite progress and advancement for your society and much has been accomplished which will elevate the science and art of medicine, and redound to the credit of the Medical Profession of the State The duties and responsibilities of your president have been lightened and made most attractive by the splendid cooperation, assistance and advice received from the officers, committeemen and various co-workers in the society

It would be difficult to conceive of a better example of team work and unity of action than has been carried on daily for the entire period since your adjournment. Your President is grateful for that change in policy which permitted him to serve as President-Elect for one year, thereby familiarizing himself in advance with the many activities and duties of the position. Your wisdom in creating this new office will be reflected not only in a greater familiarity with the position, but by more effective work done by the presidents of the future As it is now arranged, the president has a real working knowledge of his duties prior to his installation and likewise it permits him to become acquainted with the many and different conditions which exist in the various sections of the state. I regard the creation of this office as a real factor for future advancement of this organization. This has been demonstrated during the present year by the keen and active interest your President-Elect has shown in his close attendance at committee meetings and

frequent contact with District Branch and County Medical Societies

Under the wise and efficient management of our esteemed Secretary the great amount of work entailed with conducting his department has been carried on with the usual precision and exactness which has heretofore existed and indicates his active interest in the advancement of our Medical Body

Your executive officer has been a most efficient and energetic associate throughout the year Without his assistance it would be impossible to carry on our State Society activities as they are now arranged. His intense interest in our Medical Body, coupled with a willingness to sacrifice himself whenever the stress of work demands, indicates a type that is seldom found. I desire to especially call attention to his active interest in the development of the District Branch Medical Societies, the close association and contact which he has developed with the County Medical Societies and the assistance rendered to our Committee on Legislation throughout the Legislative session

Executive Committee and Trustees

Your Executive Committee has been most faithful in the performance of its many duties in handling the varied and complex questions which normally require adjustment and which not only relate to the business of your society but also to the many questions referred to it for consideration. Constituting, as this Committee does, the actual working unit of the society during the intervals when the Council is not in session, it naturally has many questions of policy and expediency to adjust. Some of these naturally carry with them the expenditure of money, a matter which must be referred to our Board of Trustees for

Licensee
333 E. 43rd ST.,

333 E. 43rd ST., NEW YORK CITY programs and the discussion elicited It was evident that the President of each District Branch and his co-workers on the Executive Committee had given much time and thought to working out the details in order that the members attending could derive the greatest amount of benefit The programs were well from the meetings thought out, contained an unusual number of practical scientific facts for the general practitioner, and also dealt largely with the civic responsibilities of the physician, and the necessity, to so prepare himself that he can become a leader in all that has to do with preventive medicine and Public Health, which is becoming such an important phase of our professional life Many of the programs stressed in a most practical way, the necessity of, and the method of procedure in the examination of the apparently well,—Periodic Health Examination, which represents a refinement in the Art of Preventive Medicine that has far reaching possibilities for both patient and physician and is probably the most important outstanding contribution towards the preservation of health that has developed during recent years. It is the essential work of the family physician, and he should adopt this procedure and safeguard his patrons from endeavors upon the part of others to commercialize and preempt this field

The program of the Second District Branch was entirely devoted to the question of Civic Medicine as carried on in a most efficient way by the medical profession of the four counties of that Branch. I would urge that our State Society study most carefully the developing of the District Branch Societies to even greater usefulness, and aid them in all possible ways including, if necessary, greater financial assistance.

County Societies

Your President has, for many years, been impressed with the thought that our County Medical Societies represent the real foundation of organized medicine, and the health of the citizens of any county is largely dependent upon the efficiency of its County Medical Society and its interest, individually and collectively, in the health problems In order to obtain definite personal knowledge of the activities of our county societies and, if possible, establish a cordial relationship and personal contact between them and our parent organization, I have taken pleasure in visiting many of our County Medical Societies The duties of your President during my term are so many, varied and time-consuming that it was possible for me to attend but thirty of the county society meetings, and I deeply regret that I could not be present at one meeting in each county, if only to demonstrate to these working units our interest, as a state body, in their activities and the welfare of the medical men composing them

At every county medical society attended there

was an intensive interest in the broadening activities of the medical profession coupled with a desire to advance its knowledge along all lines can recall no audience at any regular meeting of any county society, except in the large cities, that had less than 50% of its membership present This has been made possible by good roads and present methods of transportation which have annihilated distance and allowed physicians to be more regular in their attendance Nevertheless, it was not the size of the audiences which impressed me, but rather the keen interest in the scientific papers and their discussion apparent enthusiasm over all questions which had to do with Preventive Medicine, Public Health and County Health Departments, the work of our committee on Public Health and Medical Education, all of these questions I heard discussed frequently and in such a progressive manner as to impress me that our county units are endeavoring in all ways to advance their knowledge of curative medicine and assume their responsibility in preventive medicine and Public Health three occasions when I met with county societies, at a time when they were meeting for the purpose of attending one of the lectures in a course being given by our committee on Public Health and Medical Education, there was a greater number of physicians present than practice in that county, many having come from adjacent coun-This demonstrates the favor with which these courses of instruction are being received by the physicians

County Society meetings are the normal place to discuss the various activities which would have any influence upon the health of the people or change in any way the duties of physicians recognition of this fact we are impressed favorably by the growing tendency of the profession in some of our smaller cities to disband their local Academies of Medicine and concentrate their efforts on the duties and activities of their County Medical Society Such unification of effort and responsibility is commendable and gives the organized medical profession a greater influence Every county society should have an active committee on Public Health which would be keenly alive to all activities in its particular field Likewise in each county medical society there should be a committee on Public Relations which should so coordinate the activities of the various lay organizations as to produce a harmonious cooperation and eliminate any discord or disfunc-This committee should take the leadership in developing medical programs of county agen-Inasmuch as it seems desirable, but is impossible, for the President of your State Society to visit and address each county society during his term of office I would recommend that he be privileged to designate one of the other officers to represent the State Society at some of the many meetings and that said officer, acting in the place

sanction Our Annual Budget is prepared by the Executive Committee and is referred to the Board of Trustees for its approval Hence there is a most wise and efficient safeguarding of our funds from any tendency that might develop to indulge in unprofitable or unnecessary expendi-Yet in order that there likewise should be no curtailment in the growth of the Society or limitation of its normal activities by reason of lack of financial resources, I would suggest that there should be a very close relationship between our Executive Committee and our Board of Trustees. in order that each body shall fully understand the complete purpose of any proposed expendi-Therefore it would seem most desirable that there should be rather frequent conference between these two important bodies, and especially should this be so when difference of opinion relating to policies and expenditures seem to exist Our Trustees have been most faithful and efficient in the performance of their duties in caring for the funds of the organization and dealing with its financial affairs, which constitutes the handling of a large sum of money, as is shown by our Treasurer's Report Safeguarding our finances means greater stability for the organization, and the possibility of meeting future financial requirements of the ever-increasing activities of the Society

Journal

We view with pride the progress made by our Editor, Dr Wightman, in developing our Jour-NAL to its present high standard of scientific at-The editorials which have appeared during the past year, especially those relating to Public Health and Preventive Medicine, have created much favorable discussion and approval The steadily increasing revenue from this Publication indicates that we can look forward to a time, not far distant, when it is reasonably sure to become self-supporting Officers and Committee Chairmen of the State Society and our County Societies should use the JOURNAL to a greater extent in noting their activities, thereby disseminating matters of interest to all our medical men

Directory

We recognize our Directory as an important publication, the omission of which would be a real loss to our physicians, and upon investigation I am satisfied that it must be an annual issue in order to be effective. Our closer fellowship with the New Jersey State Medical Society, developed through our Tri-State Conference and our neighborly and very friendly association and common interest with the Connecticut State Medical Society, prompts me to suggest that it might be possible to make it more definitely the official publication of the three State Medical Societies thereby reducing the expense to our organization I would advise your consideration of this question to the extent of planning for the appoint-

ment of a committee to meet with committees from the Medical Societies of New Jersey and Connecticut to formulate a plan for improvement of the *Directory* and to make it official for the three states

District Branches

Your eight District Branch Medical Societies constitute liason organizations between our State Medical Society and its sixty county societies, and therefore they occupy a strategic and midway position and should be developed to a greater extent than has existed in prior years Fortunately this has been recognized by your society and the officers of the District Branches, so that for the past several years there has been an increased activity and interest in these organizations as shown by a steadily increasing attendance at meetings and an improved attention to the detail of their responsibilities during the intervals between meetings I am pleased to report that the meetings of these societies were exceptionally well attended during the past year, and the combined attendance at the eight meetings quite equalled the number registered at any annual meeting of the State Society A very accurate registration of the attendance in five of the eight District Branch meetings determined that there was a definite increase in attendance over the preceding year of 85% of the membership in the counties comprising those districts We are satisfied that this increase also appertains in the three districts where we did not have an accurate regis-One District Branch—the Fourth—had fully 30% of its membership in attendance We attribute the marked increase in attendance to the enthusiasm and energy of the Presidents of the District Branches and the more frequent meetings of their Executive Committees, coupled with the stimulation received from having with them at such meetings our Executive Officer, who in all possible ways endeavored to be of assistance. This plan of frequent meetings of the Executive Committees of these organizations, composed as they are of the District Branch Presidents and the President of each county society in his district, was started by my predecessor in office and has been of immense value in stimulating interest in the District Branch meetings as well as in considering the many problems the medical men have If we are to meet in their respective districts to assume our normal position as the leaders in civic medicine, we must increase the usefulness and responsibilities of our District Branch Medical Societies, all of which give evidence of the presence of great undeveloped, potential resources, the proper employment of which will greatly enhance the usefulness of the State Medical Society, both to the practicing physician and

It was my pleasure and privilege to attend the eight District Branch meetings and I was impressed by the excellence of the scientific theless, the result obtained in enforcement of this law leads us to believe that in a reasonable measure of time the state will be freed from the menace of the illegal practitioner, and through the operation of the Grievance Committee there will be investigation of alleged improper practices of licensed physicians

Conference on Medical Education

The modern standards of medical practice demand that there shall be an early recognition of incipient disease and an active interest in public health and disease prevention Some of us have considered that the recent graduates in medicine are not taking the interest that they should in the practice of preventive medicine and especially in the periodic examination of the apparently well After discussing this subject with a number of prominent physicians and surgeons throughout the state it was deemed wise to hold a conference with the Deans of the Medical Colleges located within our borders Hence on January 11, 1928 such a conference was held in New York City and was participated in by most of the Deans of our Medical Colleges, representatives from the Department of Education and a representative group of medical men from our State Medical Society At this conference the present methods of Medical Education were discussed and reviewed in detail, likewise the necessity for the practicing physician to be so grounded in the science and art of public health and prevention of disease that he can assume his responsibility as a leader of such activities in his com-It was demonstrated that the Colleges are taking an active interest in teaching these newer branches of medicine and that in the future we can hope for a very active participation by our recent graduates This Conference disclosed the great value of representatives from our medical organization meeting in conference, with representatives of our medical schools and the Department of Education for interchange of thought, the result of which can not help but be of mutual benefit to the schools, the medical profession and the public Your President would suggest that such conferences be continued throughout future years with the hope that there will result a closer bond of union between the State Medical Society the Medical Colleges and the Department of Education

County Departments of Health

During the year much thought has been given to the subject of County Health Departments and the method of their development. This forward looking movement emanated from our State Department of Health and permissive laws were enacted whereby any county having such Health Department will be reimbursed from the state to an extent of 50% of the money expended in such Public Health Program. Whilst only one county

in the state-Cattaraugus-had adopted this plan, it was noted that several others were considering Hence your Committee on Public Health and Officers of the Society felt that it was proper to study the subject and determine what attitude the State Medical Society should take and how far it should go in furthering the devel-A Conference was held coment of these units with the State Department of Health, State Charities Aid Association and State Health Officers It was decided that the movement Association in any particular county should emanate from the Organized Medical unit of that county, viz The County Medical Society, that each County Medical Society should study the subject and decide whether it was for the best interests of the people to have such a County Health Department Your Committee on Public Health has appointed a subcommittee to make a study of this subject. Three County Medical Societies are known to have given this subject careful consideration and are favorably inclined toward adopting this new Public Health measure It would seem that this important question should receive most careful consideration by each of our county units, in order that the adoption of new Public Health measures shall emanate primarily from the Medical Body The educational work necessary to secure its enactment could well be relegated to others

Committee on Legislation

The Committee on Legislation again this year maintained its record for good work. Most of its efforts were extended in preventing the passage of immical legislation, of which there seemed to be more than our ordinary share, but the Committee is to be congratulated for its zeal in having prevented any of it from coming up for serious consideration.

Legal Department

The service rendered by our counsel, Mr Lloyd Paul Stryker, has been of that same conscientious, unselfish and distinctive type which has characterized his dealings with this Society during past years. This bespeaks for us a standing in court which demands respect as well as give to our profession an increasing prestige in all affairs that have to do with questions of law Only those intimately associated with the daily routine of affairs in our Society can appreciate the great amount of work done by our counsel and his associates who have worked, throughout the year with your officers in a most harmonious and cooperative manner To realize fully the advantages of this service and the amount of work it entails one must be acquainted with the fact that somewhere in the neighborhood of one hundred and twenty suits for malpractice are instituted each year against our members articles in our Journal are a continuous source of information and advice relating to legal matof the President, shall have his necessary expenses for such service paid by the State Society In this way it would be possible to utilize the President-Elect and the Vice-Presidents in assisting in the work of acquainting our county societies with the State Society activities and at the same time establish that cordial relationship which is only developed by intimate association through frequent contact

Present day diagnosis and treatment of disease necessitates the hospitalization of an increasing proportion of our sick In no other way can they be surrounded by a proper environment and facilities for adequate study of the condition which. many times, requires much laboratory investigation and the utilization of a vast amount of apparatus and methods which are not possible in the The nursing problem and the economic situation both bespeak an increasing necessity for the patient to be treated in the hospital rather than home I have noted hospital conditions at present existing throughout the rural and small city sections of our state, and it is a source of pride in the profession to recognize the great advancement that has taken place and the fine type of hospitals found in most localities, and likewise note that they represent the central point of medical activities in their respective communities This is as it should be and will mean future better care of the sick Nevertheless, I am 1mpressed with the fact that there are four counties in the state that are devoid of any hospital facilities and there are at least six other counties that are madequately supplied with such This condition necessarily implies that the medical men of those counties are practicing the Art of Medicine under most difficult and deterrent conditions Can we, The State Medical Society, do anything to assist these counties in formulating some plan by which they may be able to succeed in obtaining for their county or community proper hospitals? Such rural hospitals would add much that must be lacking in the care of patients, and would furnish centers of medical education to the physicians in attendance at such hospitals, and likewise would furnish an impetus to the study of disease prevention and public health in such localities Therefore I would suggest that you authorize the appointment of a Special Committee which might be known as "The Committee for Development and Advancement of The Hospital Condition in the State of New York" Such Committee should make a survey of existing conditions, determine the sections that are devoid of or madequately supplied with hospital facilities, after which said Committee could aid the physicians of such counties and communities in any feasible way to procure and develop hospitals An activity of this kind would indicate medical leadership and forestall the assumption of such work by organizations less fitted to assume such Such Committee should responsibility financed by having its necessary expense account

paid by our organization and each District Branch should, in my judgment, have membership upon the committee

Relation to County Societies—A few County Medical Societies have assumed the leadership in the practice of public health and civic medicine, other societies are making tentative plans of leadership, and all now have an attitude of receptivity to the discharge of civic duties by the local physicians The fact must be recognized that the entrance of physicians into the practice of public health is only recent, and that standards of its practice are not yet fully evolved. Moreover the physicians have found the field of public health already occupied by voluntary lay agencies with whose methods physicians have often differed The past year has seen a discussion of public health practice by the physicians of New York State to an extent greater than that of all previous years Every side of the question has been discussed, and many plans have been suggested that were obviously impractical in the opinion of those who were experienced in public health matters But the officers and committees of the Medical Society of the State of New York have given sympathetic consideration to the problems of County Medical Societies, and have advised the local physicians regarding the proper course to pursue in assuming their leadership in all forms of the practice of medicine including the branches of public health and civic medicine Your President recommends that this attitude of sympathetic consideration and advice toward the County Medical Societies be continued as the policy of the Medical Society of the State of New York

Medical Practice Act

The operation of our Amended Medical Practice Law has demonstrated the wisdom of the Act. That it is accomplishing as much, if not more, than was to be expected, we have definite knowledge Through registration of practicing physicians we have at our command the essential basic factor for determining who are actually the licensed physicians of the state, thereby lessening the difficulties in administration of the law adequate reason to believe that the Act has been the means of driving from our state a large number of illegal practitioners, probably at least one thousand, who prefer to practice where the law is less stringent. This negative phase is a very important feature of the actual operation of the From a positive standpoint we know that during the first year of operation of this Act there were 103 arrests for illegal practice of medicine of which there were 30 convictions, and 58 cases are pending trial There were 12 acquittals and dismissals In all, 728 cases were investigated during the year Prosecution in the large cities, where cases are tried in General Sessions, are naturally more effective than in rural and small city sections where jury trial prevails

would care to avail themselves of such facilities, were they brought out, was the problem that your committee at that time undertook to solve. The wisdom of that activity is so apparent and its benefits are already so far reaching, that no justification of it need be undertaken at any time. It is a great pleasure, therefore, to call your attention to the splendid report submitted by the chairman of that Committee this year.

I hope you thoroughly realize the great amount of labor that this Committee has accomplished in order that so many lecture courses could be arranged and properly executed has entailed so great a sacrifice from each member that I suggest that in the future, it will be necessary to give the Committee facilities for employing a full time assistant. those counties where some physician was in a position to give a large amount of time to advertising them properly and to stimulating the physicians to attendance, the courses were most successful In not a few instances, physicians have developed an interest and sought membership in the County Society through having attended the lecture courses

This work is still in its infancy. The Committee has plans for its development that they could not inaugurate this year. The hospitals and the medical schools will be asked to take a greater share in the work in the future. The Academy of Medicine of New York City has sought, through its proper committees, to cooperate more intimately with your Standing Committee. The deans of the Medical Schools, in the conference which I have mentioned in another part of this report, expressed great interest in this particular line of work and manifested a willingness to assist more extensively if the opportunity is given them.

Committee on Medical Economics

It is with much pleasure that I call your attention to the splendid report submitted by this Committee Medical Economics is a subject which concerns us all most intimately, especially that part of it which refers to the operation of the Compensation Law men have for years felt that they have not been given proper consideration in the development and enforcement of the Compensation Law, and it is to the great credit of your present Committee on Medical Economics that, finally our State Society has achieved a standing with the Labor Department of such character as to warrant that in the report to the legislative committee making an investigation of labor, there is a section providing for the construction in the Department of Labor of a medical advisory council. A bill was prepared and submitted to the last legislature providing for the creation of such a council, and as a reflection of the superior quality of the work of your Committee, it is my pleasure to report that no opposition was presented to the passage of that bill, and its failure of enactment was due entirely to faulty drafting. With legal representation in the Council of Labor, we can expect an early solution and correction of many of the problems and injustices with which the law now abounds

Committee on Immunization of Children Against Diphtheria

The immunization of children against diphtheria, an activity which originated in the State Medical Society two years ago, has gone forward in this state with such remarkable progress that in spite of the fact that 1927 was a diphtheria year and that the United States Public Health Service reported an increase of 17 per cent in mortality, this state has shown but a 4 per cent increase. No other public health activity has met with such instantaneous approval and support, or has been so far reaching in so short a time The five-year limit for the eradication of diphtheria, which was adopted as a slogan two and one-half years ago, does not seem anywhere nearly so impossible today as it did when your Committee first considered it Credit for the phenomenal success must be given to the wisdom and tireless activity of the Committee which has been functioning all this while I urge your careful reading of the report which Dr Van Etten the chairman of that Committee has submitted

Curriculum for Nurses

The Committee on Nursing, which a year ago secured the enactment to the law which provided for the licensing of nurse registries and also provided a means of identifying nurses, is continuing its work with profit. As it will show in its report, the amendment to the law has been a real contribution and the Committee is now engaged in what proves to be a very difficult problem, that of assisting the proper authorities in revising the curriculum for nurse training schools. If our Committee succeeds in securing a revision which will be generally approved and adopted by a majority of the states, it will have achieved another great medical victory.

Committee on Public Relations

The Committee on Public Relations which you authorized, should become a permanent Standing Committee, continuing the work started by the Special Committee of the same name last year As you have seen from its report, it has begun a series of conferences with the Department of

ters and the work that is being carried on in that department

About 58 per cent of our membership is insured in the Group Plan against liability in the practice of their profession. This system of protection should be adopted by a much greater percentage of members. One wonders how so many dare to assume the personal liability incurred by not being protected in this way. Perhaps it is due to lack of familiarity with this excellent plan adopted by our Society.

Tri-State Conference

The Tri-State Conference has held three sessions this year, one in each of the states from which the representatives come The subjects discussed at the Pennsylvania conference were Medical Publicity and Immunization against Diph-Medical Publicity, it was agreed, is one of the most important subjects that can engage the medical organization of today because of the wide-spread activity taken by official and voluntary agencies in promoting public health propa-It was agreed that the three Medical ~ Societies should become more actively interested the public health propaganda of their several arm in order that the public may not be misled assuming, because the Medical Society as h rarely figures in publicity, that, therefore, the physicians have no interest in the promotion of education in matters of public health

The subject discussed at the second conference. held in New Jersey, was the Status of the Small Hospital It is not generally known that at least one-third of the hospital service is subject to absolutely no inspection whatever When one recalls that at any given moment probably two per cent of the population are sick and many of them hospitalized, the importance of proper hospital supervision becomes apparent. In the three states —New Jersey, Pennsylvania and New York there are many of these small hospitals of them, without doubt, are doing splendid work, but there can be no question but that others could In New York State, the State be improved Department of Charities has authority to inspect all hospitals completely financed by the State and all others accepting public monies The College of Surgeons inspects only the larger hospitals, thus the small ones are left entirely to their own boards, if they have any, or to the individual physician and his associates whose property they

During the discussion it was brought out that some of these small hospitals are doing unethical work, as well as poor work. The Conference decided to appoint a committee from the three states to make a searching study of conditions as they exist at present and to recommend at some future time to the Conference, action that can be referred commonly to the three State So-

cieties, and, if they think wisely, an outline of the legislation which they would suggest

The third conference was held in New York City, where the committee from your Society functioned as host Expert Medical Testimony was the subject considered Discussion was introduced in a splendid paper by our legal counsel, Mr Lloyd Paul Stryker, which has appeared in the March first JOURNAL This is an important subject and the three states are considering what action they can take to make the custom uniform in this section of the medical world

The importance of this Conference to organized medicine has become such, that other groups of states are adopting a similar procedure, for instance, the states of New England have organized a Conference Committee somewhat along the lines that we have initiated And they have gone a step further in that the Boston Medical and Surgical Journal has been taken over by the conference and will henceforth be the common journal The practice for the six state medical societies of medicine is no longer a matter of the individual physician, as we have learned very concretely from affairs in our state. It is not even confined to the County Society, but the District Branch must take a more active part than it The state organization will have problems that it alone must solve, and in such a thickly populated center as that included in the three states of New Jersey, Pennsylvania and New York, where each shares in the great metropolitan district, there will be problems peculiar to these three states and their union, therefore, seeking a solution is highly desirable. Of course, the Tri-State Conference is an unofficial body, in that the several State Societies have authorized their representatives only to confer The findings or resolutions that the Conference may develop must be reported to the respective Societies as observations or recommendations for their acceptance or rejection The need for such conference is so imperative that I hope its continuance will be assured

Committee on Public Health and Medical Education

The Chairman of your Committee on Public Health and Medical Education three years ago conceived the idea of carrying the facilities for scientific advancement and clinical research found in the larger cities to physicians residing outside those districts. Many physicians, prior to that, had established the practice of visiting the metropolitan district at intervals in order to familiarize themselves with the recent advances in the practice of medicine, but, obviously, that number was limited and whether facilities for such study could be successfully transported to more remote sections of the state and whether a sufficient number of the physicians residing outside the larger cities

would care to avail themselves of such facilities, were they brought out, was the problem that your committee at that time undertook to solve. The wisdom of that activity is so apparent and its benefits are already so far reaching, that no justification of it need be undertaken at any time. It is a great pleasure, therefore, to call your attention to the splendid report submitted by the chairman of that Committee this year

I hope you thoroughly realize the great amount of labor that this Committee has accomplished in order that so many lecture courses could be arranged and properly executed has entailed so great a sacrifice from each member that I suggest that in the future, it will be necessary to give the Committee facilities for employing a full time assistant. those counties where some physician was in a position to give a large amount of time to advertising them properly and to stimulating the physicians to attendance, the courses were most successful. In not a few instances, physicians have developed an interest and sought membership in the County Society through having attended the lecture courses

This work is still in its infancy. The Committee has plans for its development that they could not inaugurate this year. The hospitals and the medical schools will be asked to take a greater share in the work in the future. The Academy of Medicine of New York City has sought, through its proper committees, to cooperate more intimately with your Standing Committee. Personal Appreciation

Throughout the year I have been deeply impressed by your confidence and trust in having elected me as your President. As a consequence I have considered it a duty as well as a pleasure to give to this organization my best thought and

effort In so doing I have been loyally supported by your officers, your committeemen, and all other members of the Society with whom it was my privilege to work

JAMES E SADLIER, President

April 15, 1928

REPORT OF THE SECRETARY

To the House of Delegates— Gentlemen

Another year has gone by and for the third time your Secretary has the honor of submitting an annual report

The Secretary being also Secretary of the subsidiary bodies of the Society and a member of the standing committees much of his work has been of a nature not ordinarily included in secretarial duties. As the Executive Committee of the Council is the business committee of the Society, its Secretary necessarily becomes the business officer or, in business parlance, the Executive of the Society, and it is from that standpoint that he presents his report

The Society in General

The year has shown a wonderful growth of interest and enthusiasm in the endeavors of the Society to solve its educational and economic problems and promote the welfare of the profession. In this work considerable progress has been made and the way paved for greater advancement in the future.

Although many have taken active part in this work, and the Chairmen of the Committees have shown their eminent fitness for the duties entrusted to them, special mention should be made of the President, whose excellent judgment, untiring zeal, and self-sacrificing efforts brought many an issue to a successful culmination. In these matters he received able assistance from the Executive Officer

In former reports, the Secretary has taken occasion to criticise, in a friendly and constructive manner, the rather loose system under which the organization was run. He is pleased to report that there exists today an almost harmonious correlation of all the elements and component units that comprise the corporate body, a considerable lessening of the overlapping and encroachments of duties of officers and committees and a sincere cooperation of all toward the upholding of the ideals and purposes of the Society. It is not yet perfect and probably never will be but decided advance has been made.

The Society's Office

The improvement in the business efficiency continues. As each little fault or discrepancy shows itself, the Manager is quick to rectify it and no opportunity is lost in installing any method or appliance that might tend to greater efficiency and facility of work

No better proof of the growth of the activities of the Society can be found than in a comparison of the Secretary's office of today with that of years ago. Then, dingy quarters with insufficient help, now, four large airy rooms and seven permanent employees besides the extra Directory clerks, together with an Editorial Department of two offices and three employees.

With all this there is still room for improvement as to space. An office that could be devoted to meetings of the Council and of the various committees and conferences constitutes a need that sooner or later must be met. When meetings of this character take place there is almost a total cessation of important office work, the stenographers and clerks having to leave their desks and gather in a small back office. This was particularly evidenced during the conferences on the Cattaraugus situation when the office routine was virtually suspended during several days.

In former reports, the Secretary has advocated the separation of the activities into certain departments and, last year, a move was made toward this end by the establishment of the Editorial Department. He is still of the opinion that a Publication Department and a Financial Department will have to be organized in the future, but, despite the fact of the wonderful success of the Editorial Department, he feels that the time has not yet come at which any further division can be made advantageously

The Directory continues to be handled in the office by the Manager, and the Secretary, after careful examination into, and study, of the subject, believes that the plan now followed should be continued. To make any other than an annual publication of it would be to render it valueless and it would have to be abandoned altogether. The plan of joint publication with the States of Connecticut and New Jersey advocated by Editor Wightman a year or so ago has its ments

Health, looking toward a closer cooperation of the practicing physician and the Department of Health It also lent assistance to the Cattaraugus County Society in its effort to correct the situation that prevails there between the practicing physicians and the Health Demonstration From other reports you have learned of efforts that were made to help the Cattaraugus County Society secure an alleviation of the undesirable conditions into which they were drifting through the manner in which the Health Demonstration I have given a great was being administered deal of my time to the study of the situation which exists there It is to be hoped—and we have many reasons to believe—that the situation will be satisfactorily adjusted and the conditions which brought it about, which may in one form or another exist in other parts of the state, will be eventually corrected or eliminated

Cardiac Committee

Our Cardiac Committee has carried on a most commendable piece of research work which ultimately should be of worth to the great cause of preventive medicine study to be of real value must be continued over a considerable period of time and involve the expenditure of money to an extent which cannot be determined in advance, but we trust the ultimate result will sufficiently warrant such an investment of funds is definitely research work. Many may feel that this organization should not indulge in such investigation, nevertheless, it seems correct that this great medical body should carry on one definite piece of research work, such as is our investigation of Cardiac Disease In doing so we should limit our study to that particular field until something has been accomplished or until the research study has advanced to a position where it would be acceptable to some Foundation established for research purposes This would at least show our interest in the value of original investigation

Centralized Home

One cannot help being impressed by the steadily increasing development of our medical body and the great number of its activities. In the course of time we may be compelled to seriously consider a centralization of our work and the establishment of a permanent home, such as has been done by our neighboring state of Pennsylvania. In view of such possible future commendable ambition I would suggest that from our financial resources we now establish a sinking fund for the ultimate purpose of having, at some future period, a centralized home, the property of the State Medical Society, such sink-

ing fund to have allocated to it such proportion of our income as the judgment of our Board of Trustees would suggest

The New York Academy of Medicine

The cordial attitude of the New York Academy of Medicine to the Medical Society of the State of New York deserves special men-The Academy has been the landlord of the State Society for twenty years, and when the new building was constructed at Fifth Avenue and 103rd Street, rooms were assigned to the State Society at a nominal rental The Academy has accorded to the State Society the use of all its facilities, especially those of the Library and the Bureau of Clinical Information, thereby rendering it possible for physicians visiting New York City to utilize any available time and take advantage of the immense clinical resources to be found in that city, or to attend some of the many scientific meetings that are so important a part of the activities of the Academy I would especially call your attention to the editorial in the New York State Journal of Medicine, Feb 1, 1928, page 158, entitled "The New York Academy of Medicine" and which defines the liberal attitude of those in charge of this great center of medical activity members of the State Society are indebted to the Academy for this offer of personal hospitality to visiting physicians from every part of New-York State

The Practice of Preventive Medicine

Developments during the past year in the special field of Public Health and Preventive Medicine in this state demonstrate, in no uncertain manner, the fact that physicians, individually and collectively, must assume their responsibilities in all activities that have to do with preventive and curative medicine. The work of disease prevention and disease treatment have become so closely related that it is impossible to separate the two, we cannot leave unoccupied this field of prevention without seriously imperilling the very foundation of our medical profession

Let us cooperate with and utilize the lay organizations for the service they can render along various lines, such as stimulating and educating the people to seek the physician's services in both preventive and curative medicine, to provide facilities for the better practice of medicine and, in such ways as seem desirable, to assist the physician in his many and complex duties. But on the other hand, it is the duty of the medical man to recognize that, by education and professional attainments, he is the one to whom all lay bodies should look for guidance and leadership in all that has to do with the health of the people

Reports and Communications

There still remains one great defect that mars the smooth running of our affairs, and may tend to future legal troubles and complications

There is no complete file of reports and communications in the office of the Society That which may be a small matter today may become a matter of moment tomorrow and it should be understood through action of the House that all reports and official communications should go through the regularly organized channel—the Secretary's office. This does not apply to legislative matters which should be sent to the Legislative Bureau in Albany, nor to matters directly pertaining to the duties of any officer or committee which may be sent direct

The files show that this neglect is nothing new but has existed for years. The Secretary having called the attention of the necessity of such requirement both in reports and through the mail without apparent effect submits the following recommendations to the House

That, in order to expedite business, all reports of officers and committees should be sent to the office and be in the hands of the Secretary not later than twenty-four hours before the meeting of the Body to which they are to be presented

That, for the purpose of preserving correct records, all official communications should go through the Secretary's office

That all correspondence to the State Society from any subordinate body or County Society should be sent through the Secretary's office

That all present or former officers having in their possession papers pertaining to the Society should immediately forward them to the Secretary for filing

That all standing and special committees should make a monthly report of their proceedings to the Executive Committee

Furthermore, the Secretary recommends that all resolutions and motions offered in the House of Delegates should be in writing and in duplicate and

That some plan should be devised whereby the work of the reference committees could be so handled as to expedite the business of the House and avoid the jamming through of amendments and important business at the last minute

He stresses the importance of the House finishing all business and abandoning the habit of referring to the Council matters which more properly belong to the larger Body

Membership January 1, 1928		11,219

The list of honor counties whose membership shows all dues paid for the year is as follows Chemung, Columbia, Delaware, Essex, Greene, Jefferson, Nassau, Oneida, Ontario, Schoharie, Schuyler, Steuben, Tompkins, Warren, Wyoming, Yates

The Secretary cannot close his report without extending his thanks to the various officers and members whose aid and support have enabled him to bear the burden of his office

He especially thanks the Manager, Miss L D Baldwin, and publicly voices his appreciation of her faithful, untiring work and executive ability. She has been indeed the Secretary's right hand

He thanks the Executive Officer for his support and cooperation, for the many friendly offices he has performed and expresses his appreciation of the work done for the Society

He thanks the members of the Executive Committee and of the Board of Trustees for their courteous consideration of him as Secretary of those bodies

The Secretary has spoken elsewhere of the work of the President It is no exaggeration to say that he has left a record that few will ever equal, even to his old friends he has been a revelation. He has taken as his motto "He that would of the best of life, must give to life his best"

Many hours of labor and some of pleasure has the Secretary spent with him. He has met him as President, as travelling companion, as host and as friend and has ever found him the same gracious gentleman. For all his acts of kindness and friendship, he thanks him

Respectfully submitted,

DANIEL S DOMGHERTY, Secretary April 15, 1928 and its extreme difficulties and should not be entered into without thorough deliberation and intensive studies from many angles

The Secretary feels that he cannot leave the subject of the office without a word of commendation for his efficient, willing and obliging staff

Financial Department

The Society is to be congratulated upon the state of its finances, not only from the fact of the surplus shown by the financial reports but also from the standpoint of efficient management

As Secretary of the Board of Trustees and liason officer between the Board and the Executive Committee, the Secretary is in a position to observe and form a fairly accurate opinion of the work and worth of the Board and of the Treasurer's office and he unhesitatingly states to the Delegates that the most important and beneficial action of the House in late years was the establishment of a Board of Trustees

The Treasurer has been this year a member of the Executive Committee and has attended by invitation the meetings of the Trustees His keen insight and interest in the financial matters of the Society has been of great assistance in the work of these bodies and it is earnestly recommended that he be made a permanent member of both

The bookkeeping still remains a part of the Secretary's office and the new system adopted last year has established its worth but there is need of a more accurate, understandable and modern monthly accounting This will doubtless be taken care of by the Trustees

Legal Department

To many of the members the title "Legal Counsel" conveys only the thought of mal-practice defense, although the handling of these cases is but a portion of his duty He maintains a very important part in the economy of the Society being the retained Counsel of the corporation As such, his judgment and assistance saves us from many a pitfall and his legal knowledge and skill keeps our activities in strict accord with the laws governing us, whether statute, corporation or those of our own Constitution and By-Laws He sits with the Council and the Executive Committee as their legal advisor and attends the sessions of the House of Delegates in the same capacity Through his department in the Journal he keeps us informed of legal matters in general and his comments on special cases and legislation are of great value The Secretary is especially grateful to him for his generous advice in conducting many a difficult piece of correspondence

Public Relations Committee

Your Secretary has no wish to comment upon

the work of this or of any committee believing that duty a perogative of the President

He feels, however, that having attended several sessions of this special committee, one at midnight after a wild mountain ride, and having sat in conference for about five days, he is competent to judge of its worth. He, therefore, strongly urges the adoption of the amendment establishing it as a standing committee and expresses the hope that the personnel will consist of men of vision and broad minds, who, by reason of knowledge gleaned from professional practice, know the needs of the public and whom experience has taught the wisdom of safeguarding the rights of the profession without neglecting or losing sight of the rights and welfare of others

The Constitution and By-Laws

Although refusing to accept membership on the Special Committee on Revision of the Constitution and By-Laws, the Secretary at the request of the President consented to act in an advisory capacity

A study was made, therefore, of the laws governing the Society for some years past, of the various changes made in them from time to time and, when possible, the reasons for such changes. The tentative amendments were also studied from the viewpoint of their adaptability to our scheme of organization and of their influence on its efficiency. The results of this study were discussed with the Committee and with the Legal Counsel.

Having taken part in the revision the Secretary cannot well urge its adoption but he expresses the sincere belief that the Society would benefit thereby

District Branches

In company with the President, the Vice Speaker and the Executive Officer, the Secretary visited the annual meetings of the District Branches

The attendance at the meetings showed an increase over former years, the programs were of a high class and, judging from the interest shown, well adapted to the audience

The program of the Sixth District was distinctly unique as it entirely featured industrial medicine while that of the Second District was devoted to the economic phases

The Secretary sincerely regrets that he was unable to attend the meeting of the Eighth District. He thanks the officers and members of the different Districts for their courtesy and hospitality

REPORT OF THE COUNCIL

To the House of Delegates— Gentlemen

The Council has the honor of submitting the following report which includes those of the Executive Committee and the Committee on Publication

Four meetings have been held, May 11, June 16, December 8, 1927, and February 3, 1928

In accordance with the provision of the By-Laws governing the constitution of an Executive Committee, the following members of the Council were elected to serve with the President and the Secretary as such committee George M Fisher of Oneida County, John A Card of Dutchess, Charles Gordon Heyd of New York, George W Cottis of Chautauqua, and Joshua M Van Cott of Kings

Dr Orrin Sage Wightman was appointed Editor-in-Chief for the ensuing year, and Joshua M Van Cott of Kings, James Pedersen of New York, and Daniel S Dougherty of New York were appointed a Committee on Publication

A cordial invitation was extended to the President-Elect and to the Assistant Secretary to attend the meetings of the Executive Committee

The meeting adjourned to meet in New York

City on June 16th

At the adjourned meeting the principal business transacted was the appointment of the members of the various committees and a discussion of the tentative plans presented by the Presidents of the District Branches and the Chairmen of the Standing Committees

The following appointments made by the Presi-

dent were confirmed

Committee on Public Health and Medical Education—George W Kosmak, George F Chandler, William Groat, Stanhope Bayne-Jones, John O Polak, Edwin MacD Stanton, Chalmer J Longstreet, Clayton W Greene

Committee on Medical Economics—Henry B Doust, Homer J Knickerbocker, Arthur S Chit-

tenden, C Ward Crampton

Committee on Scientific Work - Harlow

Brooks

Committee on Public Relations—George M Fisher, O W H Mitchell, Thomas J Walsh, Terry M Townsend, Austin G Morris

William D Johnson has since been substituted for Dr Walsh, and George W Cottis added to

the Committee

Committee on the Revision of the Constitution and By-Laws-Samuel J Kopetzky, Horace M Hicks, John E Jennings, John A Card, J Richard Kevin

Committee to Study the Nursing Problem-N B Van Etten, Andrew Sloan, George W Kosmak, George E Beilby, Walter Conley, E Eliot Harris, J Richard Kevin, George R Critchlow, A B Chittenden

Commuttee on Toxin Anti-Toxin-N B Van

Etten, Linsly R Williams, Charles E Gordon, Frederic E Sondern, William H Ross, Matthias Nicoll, Jr, George F Raynor, W Warren Britt, Herman G Weiskotten

Committee to Study Heart Disease—Robert H Halsey, Bernard S Oppenheimer, Louis F Bishop, Edward C Reifenstein, William H Lohman, John Wyckoff, Harold E B Pardee, Hermon G Gordinier, Nelson G Russell

Dr Joseph H Bainton was later appointed to

take the place of Dr Wyckoff, resigned

The meeting of December 8th was devoted mainly to routine work and listening to reports

On February 3, 1928, by order of the President a special meeting of the Council was called for the purpose of discussing and considering the situation in Cattaraugus County with a view of devising means to solve the problem regarding the health demonstration in that County meeting was held in Executive Session at the end of which the following resolution was adopted

Resolved, That the Council propose their willingness to aid Cattaraugus County in the solution of its problem, by the appointment of an arbitration committee to be composed as follows Five members of the Council, to include the President, the Secretary, the Chairmen of the Public Relations Committee, and two other members of the Council to be chosen by the Cattaraugus County Medical Society, five members of the Cattaraugus County Medical Society, and five members of the State Charities Aid Association and the Trustees of the Milbank Fund jointly

And be it further resolved that all parties to this agreement be informed that the findings of this Committee will not be binding on any of the parties and that its purpose is that solely of attempting to compose differences and arrive at an agreement satisfactory to all concerned

Conference on Cattaraugus Situation

The first session of the conference was held in the rooms of the Society on Thursday, February 16th, at 10 30 A M, there being present Drs Sadlier, Dougherty, Cottis, Booth and Ross representing the Medical Society of the State of New York, Drs Linsly Williams, Livingston Farrand, Herman G Weiskotten, Mr Canfield and Mr Folks, representing the State Charities Aid Association and the Milbank Fund, Drs Garen Morris, Hillman, Atkins and Bourne, representing the Medical Society of the County of Cattaraugus, Commissioner Nicoll of the State Department of Health was also present by invitation

The session continued until 5.30 P M when an adjournment was taken until Friday, March 2nd, at 10 30 A M, a sub-committee composed of Drs Sadlier, Ross, Garen, Williams and Mr

Folks having been appointed to deliberate fur-

ther and report at that time.

On Friday morning, March 2nd, the second session of the Conference was called to order by Dr Sadher, all three groups being represented. The report of the Sub-Committee was presented by Dr Ross and given careful consideration, being discussed freely and fully by the interested groups. No final conclusion having been reached the session adjourned at 6.30 to meet the following week.

The third session was called to order Friday, March 9th, at 10.30 o'clock, the Cattaraugus County Society not being represented, Dr Garen having a death in his family and the others being busy professionally. A telegram was received asking that Dr Ross be designated as

the representative of this group

After a review of the salient points of the previous sessions, a tentative plan was drafted which was agreeable to the State Charities Aid and Drs Booth and Ross were appointed a committee to proceed to Olean and present it to the Cattaraugus County Society at its meeting Adjournment was taken at three o'clock subject to the call of the Chair

On April 10th, the Council Committee of five met and heard the report of Drs Ross and Booth and on April 12th made a tentative report to the

Executive Committee

As these sessions lasted about thirty-five hours, to make a full detailed report would be an almost impossible task. The Committee reports, therefore, only on the work accomplished

Summary

The following general principles for the government of the conjoint work of the medical profession and the voluntary public health agency were agreed upon

- 1 The essential part of public health work being preventive medicine, there should be no failure on the part of official and unofficial health and welfare organizations to recognize the importance of the local practicing physician
- 2 Ail those associated in the conduct of public health activities must recognize fully that preventive medicine is the doctor's rightful field and that laymen must at all times look to the medical man for guidance and leadership therein

3 Public health work within a county involves three participating factors, lay organizations, official governmental agencies, and the mem-

bers of the county medical profession

The evolution of a county health program should be the evolution of medical forces within the county. It is the duty of the local physicians to assume leadership in the organization and management of a county health department.

5 The function of lay organizations and employees of the county health organizations, acting under the leadership of the practicing physicians of the county, includes assistance in educational work, in helping those who are unable to carry out the doctor's advice, and in providing means whereby the public health program may be carried out

Lay organizations are needed in the county Their cooperation is to be welcomed by the physicians. They are needed for the great educational work they can do, for their influence on public opinion, legislation and laws, and in many other ways. But preventive medicine must be controlled and guided by

the medical men of the county

7 As the function of the county health officer is not to exercise the function of the physicians of the county but to explain the facilities and stimulate the use of these facilities by the citizens, therefore, before any innovations are put into effect by a demonstration or other agency, they should first be thoroughly studied and discussed by the medical society and the professional membership of the county board of health

8 All local publicity should be of fact and simply to inform the people of the county of public health work which is being done, why it is being done, and why it should be done

The following points were also agreed upon

1 That physicians be appointed on each of the nursing committees

2 That the County Board of Health invite the County Medical Society to appoint an advisory committee to meet with the health officer and with the Board of Health

- 3 That an advisory committee of the County Medical Society be appointed to advise the Cattaraugus County Board of Health in the preparation of rules and regulations for controlling the activities of the public health nurses
- 4 That the object of all publicity should be simply to inform the people of the county of the public health work which is being done, why it is being done, and why it should be done

That there should be a representative of the County Board of Health, the County Medical Society and the County Tuberculosis Asso-

ciation to visé publicity material

6 That a larger number of physicians should be placed on the Executive Committee of the Cattaraugus County Tuberculosis Association and that its meetings are to be held at times and places convenient to the physicians

7 That Mr Folks promised to use his best influence to bring together the President and the Executive Secretary of the Cattaraugus County Tuberculosis Association and the President of the Cattaraugus County Medical Society to arrange these matters

The following resolutions were subsequently adopted by the five members of the conference representing the State Society

Resolved, That the members present representing the Medical Society of the State of New York urge upon the Cattaraugus County Medical Society the acceptance of these concessions and urge that the Cattaraugus County Medical Society cooperate insofar as it can to further the proper administration of the public health activities of the county, and be it further

Resolved, That Drs Ross and Booth be appointed a sub-committee to convey these resolutions to the County Society, and to meet with

its representatives in person

At the meeting between Drs Ross and Booth and the Cattaraugus County Medical Society, it was agreed that a joint committee of fourteen, seven from the Council and seven from the County Society, should be appointed to endeavor to determine so far as possible the future of the demonstration. As the members of the Council to serve on this committee, the names of Drs Sadlier, Trick, Dougherty, Card, Booth, Madill and Ross were suggested.

In accordance with this suggestion the members above named were nominated by the President and confirmed by the Executive Committee

at its meeting on April 12th

Executive Committee

The Executive Committee has held nine meet-

ıngs

As in former years, the work of this Committee has been mainly routine in character providing for the proper and efficient carrying on of the business of the Society. The most important of this work being the regulation of the work of the various committees and receiving reports thereon, the appointment of necessary special committees, the receiving of applications for special appropriations and transmitting them with recommendations to the Board of Trustees, the preparation of the budget and in short acting as a business committee, and as an ad inferim council.

Special mention may be made of the following actions. The appointment of Dr Frank Overton as Executive Editor, the renewal of the contract with Dr Joseph S Lawrence as Executive Officer, the appointment as a budget committee of Drs Fisher, Card and Dougherty, and as a Committee on Publication of Drs Van

Cott, Pedersen and Dougherty

Also the appointment of Dr George W Cottis as Acting Chairman of the Committee on Public Relations during Dr Fisher's absence, the appointment of Drs Lucien Howe, John E Jennings and Thomas E Curtin as Special Committee on Prize Essays and the appointment of a Medical Research Committee under the Chairmanship of Dr Frederic E Sondern The place of the Annual Meeting and the

selection of the Chairman of the Committee on Arrangements having been referred to the Executive Committee by the Council, the Committee unanimously elected Dr James N Vander Veer as Chairman of the Committee on Arrangements and decided that the meeting should be held in the City of Albany on May 21, 22, 23, 24

Assistance was rendered the District Branches by recommending a special appropriation for their executive meetings and raising the allowance for the annual meetings from \$100 to \$250

Committee on Publication

This Committee has held a number of conferences with the Editor at which reports have been received from the Executive Editor and the Advertising Manager The Committee feels that the Society is to be congratulated upon the work done by the Editorial Staff and that the thanks of the Society should be extended to them

Journal

The following shows the 1927 receipts and expenses exclusive of stenographers' salanes, rent, incidentals, etc

Receipts

Advertisements and Sales \$40,091 02 Income from dues 10,717 00

Expenses

Salary of Editors \$ 6,700 00
Printing, postage, mailing 32,966 51
Commissions 9,160 54

The cost of the *Journal* to the Society shows a decrease in 1927 over 1926 of \$11,474.62 This decrease is due to an increase in receipts from advertisements and sales of \$11,085.85 and to the crediting \$1.00 of every member's dues to the receipts of the *Journal*

Directory

1927 Receipts and Expenses, exclusive of stenographers' salaries and incidentals

Receipts

Advertisements and Sales \$ 8,469.25 Income from dues 10,717 00

Expenses

Printing, postage and delivery \$13,630 90 Commissions \$34 65

The actual cost, of the Directory, in spite of an increase in the edition of five hundred copies, and thirty-six pages in the size of the book, shows an increase of only \$109.44. The amount received from sales is practically the same as in 1926, but the receipts from advertisements show a decrease of \$714.00. \$1.00 of every member's dues has been credited to the receipts of the Directory, the same as with the *Journal*

Respectfully submitted,

Daniel S Dougherty, Secretary

April 15, 1928

REPORT OF THE BOARD OF TRUSTEES

To the House of Delegates—Gentlemen

The Board of Trustees has held nine meetings since the last annual meeting of this Society

In June, 1927, the Board approved the Annual Budget, prepared and submitted by the Executive Committee. It approved the bond of the Treasurer and appointed a public accountant to audit the accounts of the Society

In accordance with Section No 32 of the By-Laws, all resolutions or recommendations of the House of Delegates, Council and Executive Committee pertaining to the expenditure of money have been submitted to the Board of Trustees for approval and have been acted upon. While the Annual Budget contained the chief items to be approved, yet from time to time during the year, added requests for funds for various projects were submitted by the Executive Committee for approval

It has been the effort of the Board of Trustees to limit such expenditures to amounts consistent with our resources and commensurate with the importance of the project to the Society, and in all cases to be assured that such expenditures were permissible under the restrictions of our constitution

The financial condition of the Society has been scrutinized at each meeting of the Board. This involved a consideration of the monthly report of the Treasurer and Auditor, a survey of current expenses and the condition of funds granted to standing and special committees, and a discussion and action on all requests for funds submitted by the Executive Committee. In addition to the above routine, a special committee of two of the Trustees and the Treasurer has made frequent reports to the Board on the status of investment and trust funds. This special committee has consulted conservative bankers and investment

specialists regarding the character of the securities owned and purchased by the Society. It is gratifying to note a substantial advance in value of our securities over the purchase price

The Board respectfully refers the members of the House of Delegates to the Treasurer's report for a detailed account of the financial condition of the Society Under the heading of assets will be found an item of Trust Fund amounting to \$4,407 This consists of funds which have been given to the Society for Under same heading of assets specific uses will be seen an item marked investments amounting to slightly over \$50,000 at the date This represents sums which of this report were saved from time to time over and above the actual expenditures of the Society Two and one half years ago the total sum under this item amounted to only \$8,000 Your Board of Trustees during the past year was able to add \$15,000 to this fund Your Board urges the desirability of the continuance of this policy of building up a permanent investment fund to a substantial figure

The Board of Trustees would particularly call attention to the mounting costs to the Society entailed by the action of the House of Delegates in recommending special committees on research and investigation, especially those requiring extensive clerical help, printing and traveling expenses. Due regard for the ability of the Society to sustain the expense ought to enter into the consideration of these projects, worthy as they may be

Respectfully submitted,
ARTHUR W BOOTH, Chairman

April 15, 1928

REPORT OF THE BOARD OF CENSORS

To the House of Delegates—Gentlemen

The Board of Censors has held but one meeting during the year

Pursuant to the call of the President, the Board convened on March 7, 1928, to hear the appeal of Dr F C Conway from the action of the Medical Society of the County of Albany in declaring certain ballots cast at its annual election not valid by reason of their containing the names of less than three candidates for delegates to the State Society and thereby disfranchising litteen members of the Society

The meeting of the Board was held in the rooms of the State Society, 2 East 103rd Street, New York City, a quorum consisting of Drs Sadlier, Dougherty, Barton, Post and Cottis being present Dr E A Vander Veer, Councillor of the Third District, was also present but, being a member of the Albany County Society, took no part in the deliberations and did not vote. In the proceedings Mr L P Stryker, Counsel for the State Society, acted as Counsel for the Board of Censors and Dr J F Rooney for the appellant, the Society resting its case upon submitted data

After a public hearing lasting three hours the Board went into Executive Session and found for

the appellant, the appeal, however, being sustained in modified form, the Board not deeming it necessary to order a new election

The findings were based on the following facts First As the By-Laws of the Society state that elections shall be by ballot with no qualifying clause as to form or manner, the resolution that a ballot on which three names are not voted for

delegate shall be rejected took the form of an amendment and was enacted illegally

Second The resolution was against precedent as established by the House of Delegates in various elections

Third The House of Delegates in 1922, by advice of legal counsel, ruled that a By-Law of like tenor, offered upon the floor by the Reference Committee on By-Laws, was illegal

The motion therefore, being itself null and void, the rejected ballots should be regarded as valid and so counted

In accordance with this ruling the sealed box of ballots received from the President of the County Society was opened and the ballots counted, the result of the recount being that Drs Hinman, Mullens and Bedell were declared elected delegates The recount for officers and alternate delegates merely showed an increase in the number of votes cast for them

Respectfully submitted,

Daniel S Dougherty, Secretary April 15, 1928

REPORT OF COMMITTEE ON LEGISLATION

To the House of Delegates—Gentlemen

Your Committee on Legislation takes pleasure in submitting the following report of its activities for the past year

Early in the autumn, anticipating that chiropractic and other undesirable legislation would be proposed at the next meeting of the legislature, we continued the plan which we followed in the two previous years of stimulating lay and public interest in opposing legislation that would be inimical to the practice of medicine. Directly after election we communicated with the chairmen of our County Committees, recommending that they get in touch immediately with their Senators and Assemblymen and assure them that the Medical Society would expect them to support any legislation that might be proposed which would benefit the public, and that they should as vigorously oppose proposals that did not have such qualifications

At the opening of the session we promptly reestablished the contacts of previous years with the chairmen of the committees in the legislature and with the leaders of both houses. We kept the chairmen of the County Committees informed of what was transpiring in Albany by regular bulletins sent out at weekly intervals. Twelve bulletins were prepared and distributed

We are pleased to report that no legislation adverse to the practice of medicine was enacted this year, in spite of the fact that numerous attempts were made. Three chiropractic bills were introduced, but none of them emerged from the initial committee. The anti-vivisectionists, the anti-vaccinationists and the birth control propagandists all endeavored to have their pet legislation enacted, but none was more successful than in previous years. The osteopaths reintroduced their bill of last year in both houses, but were

unable to get it out of committee. The bills that have a tendency toward state medicine, namely, health insurance and cancer clinics, both failed to emerge from their committees Several particularly undesirable bills were introduced late in the season, one which would have changed the penalty for violation of the drug addict law from misdemeanor to felony, another which would make injuries received by a child before and during birth have the same standing in law as though they were received by the child subsequent to birth, another that would have made it possible for any relative to prevent an autopsy, and another that would have extended the period for the beginning of suits in malpractice. All of these failed to receive the approval of the committees to which they were referred

Of the 3,391 bills introduced in the legislature this year, all of which had to be carefully scanned by the Legislative Bureau, 67 had a more or less direct bearing upon some phase of the practice of medicine Of these 67, 25 were particularly obnoxious and their passage was heartily opposed. Twenty-eight had nothing about them to recommend them particularly for our support and, yet, as they were drafted, were not particularly objectionable We maintained a close watch over them to see that in their progress they were Most of these failed not undesirably amended of passage Fourteen were considered beneficial and the Bureau did what it could to advance their progress Of this number five were enacted into law and nine have failed. Among the last, the one that received our heartiest efforts was the bill introduced by the committee to investigate labor, creating in the Department of Labor a Medical Advisory Board Unfortunately in drafting this bill provision was not made for an appropriation to cover the expenses of the Medical Council, which it indicated should be paid. Aside from

this there was no opposition to the bill and we are confident that when corrected and reintroduced next year, it will have an uneventful career

Your Committee takes great pleasure in stating that the Executive Officer found his work among the legislators this year unusually congenial. He was called upon in an advisory capacity by committee chairmen much more frequently than in any previous year, and the requests and suggestions of your Committee, as transmitted by him, were always given sincere consideration. We cannot help but feel that the legislators, by their readiness to consult with the representatives of organized medicine, are reflecting the true sentiment of the public and a growing desire on its part to trust its matters in the practice of medicine and public health to the judgment of the physicians

The Committee wishes to take this occasion to express its gratification for the hearty cooperation it has received from the legislators, especially the two Public Health Committees, whose chairmen are Senator Webb and Dr Lattin

On February 14th your Committee held a conference in Albany with the County Chairmen Twenty-five County Societies were represented The bills that had been introduced up to that time were considered and future action outlined We had as honor guest at the luncheon Senator Truman, chairman of the legislative committee that

has been making a study of labor conditions in the last two years. He in his address assured us that his committee was very appreciative of the support that the Medical Society had been giving them and he hoped the bill which they were proposing to introduce, creating a medical advisory council in the department of labor would receive our support. I regret to say that at the time of the conference I was "hors de combat" and obliged to spend the time in the hospital Dr Aranow, at my request, presided

Your Committee has also been interested in assisting the representatives of the American Medical Association in their efforts to secure favorable legislation in Washington. We have written several letters to our Senators and Congressmen, stating our position on bills that were before them, and on several occasions we have done the same to chairmen of special committees having important legislation under their consideration.

We cannot close our report without expressing our sincere appreciation of the splendid cooperation we have had from the officers of the State Society and the chairmen of the County Committees. We feel that to a great degree the success of our work hinges upon such prompt and effective cooperation as we have had in the last year

Respectfully submitted,

HENRY L K SHAW, Chairman

April 15, 1928

REPORT OF COMMITTEE ON SCIENTIFIC WORK

To the House of Delegates— Gentlemen

On behalf of the Committee on Scientific work, the Chairman takes pleasure in presenting the following report

In addition to the usual Scientific sessions, the programs of which speak for themselves, there will be this year a joint meeting of all sections on Wednesday evening

This meeting will be presided over by the President of the State Society, and will include addresses on the Cost of Medical Carc or Hospitalization of the Middle Class Economic Group Medical Aspects of Workmen's Compensation the Morals of Medicine the Present Status and the Future of the Practice of Medicine—subjects which are of five interest to physicians

The scientific demonstration will be devoted to the study of Cardiac Diseases, and will be open the entire meeting, from Monday to Thursday— The last day, Thursday, being devoted to a lantern slide demonstration

The Chairman wishes to express to the Section officers his most sincere appreciation of the splendid cooperation which they have given him to Dr Halsey and his Committee for the valuable demonstration which has been prepared by them, and to the President of the State Society for the interest and assistance which he has so freely given the Committee

Respectfully submitted,
Samuel J Kopetzka, Chairman
April 15, 1927

REPORT OF COMMITTEE ON ARRANGEMENTS

To the House of Delegates—Gentlemen

The Chairman of the Committee on Arrangements and his Committee beg leave to make the following partial report to the House of Delegates relative to the annual meeting to be held in

Albany, May 21st to 24th inclusive

In the beginning it may be said that very little precedence was at hand in print relative to the actual planning for such a large meeting as the annual meeting has now become, so that a careful review of the situation dictated to the Chairman the getting out of a bulletin with all of the minutiae necessary in such an undertaking

A copy of this bulletin was furnished to the office of the State Society with the hope that in a measure it may act as a partial guide and help

to future Chairmen

There exists in Albany now no large floor space save in the State Armory for the adequate presentation and maintenance of commercial exhibits and meeting rooms such as are required Hence through the kindness of the Commanding Officer of the State Armory the same has been obtained for the meeting, and here will be held the commercial exhibits and the meetings of the Scientific bodies

The House of Delegates will meet in the Ten Eyck Hotel, and the social functions will also be

held there

This covers the physical parts of the meeting Your Committee has entered into contracts with one of the large firms that deal in putting on of expositions for the constructing of the booths and the maintenance of the electrical

operations in the Armory

A trucking contract is necessary and contracts tor furnishing stereopticons, moving picture machines and projectors for the various scientific meetings. In this connection it is recommended that the Society purchase a suitable number of stereopticons and several moving picture machines as there has been great embarrassment found in providing a sufficient number of these for the various scientific sessions owing to the fact that many of the speakers are booked for the sametime on the same days in the various scientific meetings, thus necessitating a number of these machines to be used at one and the same time

In view of the fact that there are certain insurance restrictions relative to the use of such lanterns only those licensed by the Insurance

Underwriters should be purchased

Should the Society purchase a sufficient number it would seem that these can then be used from year to year without embarrassment to future Chairmen and in the interim could be used on loan by various County Societies, District Branches, etc, for meetings which they might desire

This recommendation was immediately for-

warded to the Executive Committee of the Society and more may be heard from them or the Trustees relative to the recommendation

Your Committee has also found it difficult to get a sufficient number of blackboards, as there is need now of some twelve in the various scientific rooms, in the House of Delegates and at the information desks

It would respectfully recommend that fifteen roll type, cloth blackboards be purchased, which can be done at nominal expense, and these can be utilized from year to year, tacking them to beaver board and giving required usage at the least expense

This recommendation also went forward to the Executive Committee and probably will be heard

from later

In view of the fact that contracts call for the furnishing of chairs and tables to each booth for the use of exhibitors, said tables to be of approximately a certain size, it has been found very difficult to obtain the same, but finally they were rented from Odd Fellows Hall through the kindness of the Trustees of the same, where an adequate number can be gotten. When it is realized that some eighty tables are necessary for commercial booths and other purposes it can be well seen how difficult a matter it is to handle such a problem in the future

It would seem wise that hereafter the contracts with the commercial exhibitors call for their furnishing of their own tables

These are the difficulties which have first been encountered and which your reference committee is asked to act upon to relieve in a measure the embarrassment of future Committees on Arrangements since the meetings of the Society have now grown to such a degree as to limit the meeting places apparently to certain cities

Your Chairman has divided the duties of the individual members under various heads as follows, the same to be known as sub-committees

- 1 Committee on Reception and Registration—This Committee in general has to do with the reception and registration of delegates in cooperation with the office of the State Society and has to see that all proper provision is made therefor in connection with the office of the State Society, and has been assigned the duty of caring for the general meeting to be held on Wednesday evening, and for the Delegates' Dinner on Monday following the afternoon session
- 2 Hotels and Garages—This sub-committee has provided a list to be printed in the notices sent out from the State headquarters of the hotels and garages in Albany, Troy and Schenectady, together with the various charges and accommodations that can be furnished therein
- 3 Meeting Places This sub-committee has to do with the meeting places of the Scientific work

In general for this meeting the meeting places are all under one roof in the State Armory

The minor details are many relative to the setting up of each room for the Scientific Sections in relation to seating capacity, signs for directing the members to the different rooms, providing lanterns, screens, blackboards and the like for each room, containers for the convenience of those who smoke, drinking water facilities, and the like

- 4 Banquet, Annual Meeting and Ball—This sub-committee has entire charge of the banquet and the annual meeting to follow the same which will be held in the Ten Eyck Hotel, and has to do with the menu, reception of guests, speakers, orchestra, tickets, and the like, together with the final arrangements for whatever dance is to take place later
- 5 Commercial Exhibits —This sub-committee has one of the hardest duties and perhaps the most tiring, for this has to do with seeing that the exhibits are properly received for some days before the meeting opens in the Armory and the proper construction of the booths and whatever there is with the commercial exhibits in the Armory, with the registration booth, and the necessary details as to telephone, drinking water, messengers, clerks, tables, signs for exhibitors' booths, and so on, which are very minute. In this connection it has been necessary to enter into a contract with a trucking company in order that the business of the meeting may be kept within proper lines.

Under the sub-chairman there is also delegated to him the registration of the members in the Armory which is carried out in conjunction with the office of the State Society

6 Entertainment and Publicity—This subduty of the Committee on Arrangements has always been a problem since it entails the caring for the ladies who attend the annual meeting, physicians as well as wives and others of the delegates and members of the Society, and also the proper entertainment of such members who do not wish to participate in the scientific sessions

For this meeting it is hoped that the same have been covered sufficiently to warrant praise when the meeting is over

7 Finance, Audit and Account—In our Constitution and By-Laws there have recently been instituted certain provisions whereby no money can be expended without the aproval of the Board of Trustees

While in this instance it has not led to any embarrassment on the part of your Chairman of the Committee on Arrangements yet it is recommended by the Committee on Arrangements that some manner of leeway be given to the Chairman of the Committee on Arrangements to enter into certain contracts, mostly of minor import,

without consultation with the Board of Trustees, or at least with the approval of the President of the Society or some accredited officer, without liaving to call together hurriedly the Trustees to obtain their signatures

A great deal of responsibility is placed upon the Chairman of the Committee on Arrangements and as the cost of a meeting is now in rough figures some \$5,000 it can well be seen that the larger part of this must be contracted for in advance, the main items of course being rental of hall, construction of booths, rental of meeting place for House of Delegates, provision for seating, provision for lanterns, and such matters as could well embarrass a Chairman did he not get at his work early and place it before the officers of the Society in Council

Your Chairman is happy in the fact that he has received unstinted help and cooperation from the officers of the Society in his various suggestions relative to the expenses to be incurred, and in the majority of instances has had to take upon himself the making of contracts in consultation only with the President and Secretary of the Society and such other officers as he could come in touch with, and yet this shows up a matter which should be settled by the Council and Board of Trustees relative to the next annual meeting

It is to be understood that certain of the subcommittees, through the Chairman of the general Committee, must also expend money in advance which it is to be believed will be returned to him on proper vouchers. But there is no provision for such except the appropriation that is made in the usual manner, now all too small for the conducting of a meeting

There should also be some definite arrangements made whereby there should be credited to the Committee on Arrangments a sum of money which they are now compelled to expend for other committees to whom appropriations have been made.

It would seem proper and is recommended by your Committee on Arrangements to the House of Delegates that a Committee be appointed from the House at this meeting to study the question of the annual meeting in all of its phases and to draw up certain general rules for guidance relative to the conduct of coming annual meetings. Such a report from a Committee who honestly studies the matter would be of great value to the Society in the future and would give to the members of the Society an idea as to the importance and expense of their annual meeting

8 Heart Demonstration—This year, as in former years, there is to be a demonstration by a special committee on a special subject

The conduct of this demonstration so far as the Committee on Arrangements is concerned consists in the allocation of proper space for the demonstration and setting up of the paraphernalia desired to conduct the same Here again the Committee on Arrangements has to expend from its small appropriation (which was sufficient in previous years but has now been outgrown) monies for that which comes really within the province of the Scientific Committee or a special committee working under the direction of the Council, and as such again touches the subject of proper expenditures by your Committee on Arrangements

From a survey of the plans as made out in the bulletin and as criticised, and suggestions made by others than those on the Committee on Ar-

rangements it is hoped that the details of this meeting will be found to be complete in all ways and that suggestions or criticisms of the manner in which this meeting is conducted so far as the arrangements are concerned will be sent to the undersigned, the Chairman, in order that they may be incorporated in his final report, which, of course, will not be made until after the meeting is over

Respectfully submitted,

James N Vander Veer Chairman April 15, 1928

REPORT OF COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

To the House of Delegates— Gentlemen

Your Committee on Public Health and Medical Education begs leave to submit the following re-

port for the current year

Graduate Education —As in the past, graduate education has continued to be the major activity of the Committee This is undoubtedly to be expected, for as has been mentioned before, this particular piece of work constitutes the most important single activity which organized medicine can contribute to public health Furthermore, the necessity for such work, as has been, and is now being accomplished through the courses given by the County Medical Societies, becomes more imperative as the field of Public Health work ex-This is particularly so, if the death rates of degenerative diseases and cancer are to be lowered as a result of greater concentration on individual health problems It should be a source of gratification to the Medical Society of the State of New York that the demand for these courses continues unabated

Courses in Pediatrics in Montgomery, Otsego and Schoharie Counties, and a course in Obsterics in Oneida County—definite dates for which were announced in the last Annual Report of this Committee—were successfully concluded before the last meeting of the House of Delegates. The following courses were in actual progress, or arrangements completed for, at the time of the last Annual Meeting Pediatrics—Rockland, Chautauqua and Tioga Counties, Obstetrics—Cayuga and Livingston Counties, Syphilis—Washington and Warren Counties (one course combined), Gastro-Enterology—Jefferson County, Heart Disease—Albany County, Diseases of the Heart and Lungs—Columbia County, and miscellaneous course at St Lawrence County. All of the above courses were completed under the direction of Dr Gordon, Chairman of last year's Committee

It should also be reported that the County of Saratoga planned and conducted most successfully its own course on Diseases of the Chest,

which began April 21, 1927 This work was done without any aid, financial or otherwise, from the State Society

With the beginning of the work for the current year certain difficulties immediately arose. The State Department of Health, which hitherto had provided the funds in addition to caring for the details of administration of the courses given in Obstetrics and Pediatrics, which subjects represented the major efforts of the Committee, informed the Chairman that the balance of the appropriation for this purpose was insufficient to finance more than five courses, and that no further appropriation was expected Furthermore, as courses in these particular subjects had been given in most of the counties in the State, it was apparent that other subjects would have to constitute the courses to be given in the future This condition not only made necessary the most economical use by the Committee of the funds appropriated by the State Society for its use, but an increased appropriation for the current year as well, and also a material increase in the amount of detail and office work carried on by the Chair-The formulation of a more definite man's office program of expansion of the work in graduate education became an imperative need The later problem has been the harder because it has had to be accomplished, while at the same time fulfilling the request of County Societies for actual courses

During the fall of 1927, courses in Diseases of the Heart were given in Herkimer, Cayuga and Chenango Counties, Metabolism and Nephritis in Clinton and Sullivan Counties, and miscellaneous courses in Wayne and Orange Counties. These courses were financed, organized and directed solely by the State Medical Society. In addition, through the efforts of the Committee, courses in Obstetrics were given by the State Department of Health in Montgomery, Broome and Cortland Counties, and a course in Pediatrics in Oneida County

With the completion of the fall courses, the Chairman adressed a letter to several medical

teachers throughout the State informing them of the purpose and scope of the State Society's work in graduate education, and requesting that they outline for the Committee courses in subjects in which they were considered to have had large teaching experience. They were also asked to select lecturers willing and capable of giving the The response to these various talks suggested requests was most gratifying considering the fact that the letters were sent at a time when most of these men were very busily engaged by reason of both professional and teaching duties replies were received from fifty-six enquiries Several replies contained outlines for more than The Committee has now on file one course outlines for the following courses Internal medicine (including gastro-enterology, heart disease, diseases of the blood, and miscellaneous) 7 courses, surgery, 9 courses, orthopedic surgery, 3 courses, pediatrics, 2 courses, obstetrics and gynecology, 2 courses, neurology, 2 courses; physiotherapy, 2 courses and dermatology and syphillology 1 course

The above outlines have aided greatly in preparing the work which the Committee has carried on as its spring program. These outlines offered to the County Societies a large and varied group of courses from which they were able to make most satisfactory selections. It is hoped that in the future these outlines can be offered to the County Societies in published form which it is believed will still further facilitate the selection of courses. Time and expense have prohibited

doing this before now

The following courses will have been completed before the Annual Meeting of the House of Dele-Internal Medicine—Albany, Schenectady and Chemung Counties, Heart Disease-Saratoga and Greene Counties, Diseases of the Heart and Blood-St. Lawrence and Jefferson Counties, Neurology-Montgomery County, Physiotherapy-Tompkins and Columbia Counties A course in Internal Medicine-consisting of six lectures, given once a month—has started in Cortland County Courses in the following Counties will be given immediately after this meeting, Internal Medicine—Fulton, Otsego, Schoharie and Tioga Counties It is also expectèd that a course in Obstetrics will be given in Allegany County, and plans are being made for a course in Internal Medicine in Onondaga A course in Internal Medicine in Ontario County, with which it is expected one or more nearby counties will join, and a course in Internal Medicine and Surgery in Monroe County, all of which will be given in the Autumn should be noted that an attempt has been made to have none of these courses in progress at the time of the Annual Meeting of the State Society, and in arranging the Autumn courses the same attempt has been made to prevent these conflicting with the meeting of the district branches

It is our opinion that the future of the State

Society's work in graduate education is a subject which should receive most serious consideration from the House of Delegates. The three years of its existence have produced an increasing demand for courses by County Societies. The courses have stimulated physicians to further study and have produced more active interest in the work of the County Societies. As a result the work so far carried on would seem amply to justify being continued.

The principal questions for consideration, are: First To what extent the State Society feels it can appropriate money for this work, and, second, how expansive should be the scope of the work? Reference has already been made to the contribution of both money and services of the State Department of Health during the first two years the work was carried on, the State Society supplying but a small part of the cost during that For the present year the customary appropriation of \$5,000 to the Committee was made by the Board of Trustees, and recently \$4,000 more has been made available should it be needed. During the present year twenty-six separate courses will have been given, of which twentytwo will be paid for from State Society fundswhile only four have been financed by funds from the State Department of Health in marked contrast to the experience of the previous two years during which time only eight courses were financed by the State Society It is expected that the work of this Committee for the present year will not exceed \$8,000, which includes besides the cost of the twenty-two courses, the cost of administration and other general purposes, also payment for some of the courses given under last year's program but completed after the last Annual Meeting It is apparent, therefore, that the State Society should be prepared to appropriate at least \$10,000 annually if its work in graduate education is to be continued as at present, and a larger sum if the work is to be made more efficient

The preparation of a course for a County Medical Society demands a large amount of time upon the part of the Chairman and the members of the Committee. A large volume of correspondence has to be carried on with the representatives of the County Society before a definite choice of a course is made. This has to be followed by several letters to the various lecturers. obtaining their consent to serve, and then arranging dates satisfactory to all concerned The progress of a course demands constant supervision, and reports must be obtained after the completion of the lectures, vouchers for their expense must be prepared, and checks sent to those to whom the Committee is indebted A considerable amount of traveling is required. A trip to the County is far more satisfactory than correspondence in making preliminary arrangements is also desirable to have as often as possible a member of the Committee visit each course once

How long it will be possible to depend on volunteer aid for this detail work is problematical, though it is fair to assume our members will be glad to contribtue their services in furthering this work just as long as possible. This point is discussed simply to indicate that should such a paid service become necessary it would add greatly to the cost of the work, probably an amount equal to the cost of the actual course.

Among several methods of aiding the Treasury of the State Medical Society in financing this work, three have suggested themselves

- 1 Charging a small registration fee to those attending the courses
- 2 The acceptance of funds from private sources
- 3 A growing tendency for the larger County Societies to sponsor their own graduate education, and especially when in conjunction with Medical Colleges within their own County they can offer more extended courses to their own members and those of nearby County Societies as well

While the first method has much to recommend it, outside of the funds it might produce, it is not believed that the time has yet arrived for its adoption except for purely registration purposes. The advantages and disadvantages of the second method should be thoroughly discussed before coming to any final decision Assuming the adoption of this method, the State Society should reserve for itself final decision and absolute authority over all matters concerned with its While it is more than probable that the approval of such a method would be denied by a large majority of the Society's members, nevertheless, it is conceivable that it would be perfectly proper to accept funds from organizations committed to the control of some particular disease, for courses in that particular subject, particularly when that organization raises its funds by popular appeal and has more money than it can adequately and judiciously expend The third method, it is believed, offers the most reasonable hope for aid

For some time graduate education has been continuously carried on in Kings and Queens Counties Nassau, Erie and Saratoga Counties have also sponsored their own courses, and in New York City the Academy of Medicine offers medical lectures to the profession, and the County Society lectures in preventive medicine for the public Kings County has had the most ambitious program which should serve as a stimulus to other County Societies with the same facilities at their disposal If all the larger County Societies were to adopt such programs graduate Education would be in constant existence in several centers of the State, and the State Society would be relieved of providing courses except in Counties at some distance from these centers The duties of

its Committee would become largely advisory, and that of acting as a general correlating agent. The scope of the work could naturally be greatly expanded under such a plan Except in such cases where the County Society conducts its own courses, and then usually in affiliation with a closely located Medical College, the Committee feels that the scope of the work—the purpose of which is really to take graduate education to the physician without any great loss of money or time on his part-should not be too expansive and should be broadened only under the conservative advice of medical teachers of large experience. It is felt that while the courses should deal with the progress and advance of modern medical science, they should be given in a most practical way

Lecturers should be selected with the greatest of care Knowledge, experience and teaching ability being the qualifications for such selection. The type of lecturers now being used in the State Society's work is indicated by the fact that the list of contributors to a most recent Medical Publication contains the names of twelve men who are serving this Committee. No attempt should be made on the part of the State Society to enter the field of extensive and highly specialized postgraduate study.

Other Activities—The Committee provided a talk on Bacteriology for Columbia County and has assisted several County Societies in obtaining speakers for their regular meetings. Because of the large number of lecturers and subjects listed in the Committee's offices it is able to make suggestions to County Societies at all times along This service can be greatly increased if all County Societies will mail to the Chairman's office bulletins and announcements of programs of their meetings. The Chairman of the Committee gave talks at the 5th, 7th and 8th District Branch meeting and before the Societies of St Lawrence, Ontario and Queens Counties Dr Longstreet represented the Committee in a talk to the Allegany County Society The Chairman has attended courses in Wayne and Chinton Dr Chandler represented the Committee at the course given in Sullivan County, and Dr Longstreet at the course given in Broome The President of the State Society also kindly attended the courses in Clinton and Sullivan Counties The Chairman has attended executive meetings of several District Branches, the conference of County Society Secretaries, and various meetings of other Committees conferred with health agencies, both official and un-official, and in addition he has held four conferences in different parts of the State with representatives of County Societies for the purpose of planning courses for the later half of the year This method proved more satisfactory for arranging the details of courses than by correspondence

The Committee has had two regular meetings The first meeting was held in Albany on September 22nd, and the second was held in New York on December 15th At each meeting all but one member attended. In addition there were present at the meetings various officers of the State So-At these meetings the following subjects were thoroughly discussed Graduate Education, Diphtheria Immunization (especial attention being paid to the work which the Schenectady County Medical Society is doing in their county, and to which the Committee has given official endorsement), the establishment of County Health Units, Periodical Physical Examinations, Child Health Consultations, Variations in Maternal Death Rates between rural and urban districts A sub-committee composed of Dr Kosmak, Dr Polak and Dr Farmer, has been appointed to study the later problem The State Commissioner of Health has been notified of the appointment of this Committee and its services placed at his Another sub-committee composed of Dr Stanton, Dr Chandler, Dr Longstreet and Dr Farmer has been appointed to make a study of County health Units and it is expected that this Committee will be of considerable service to County Medical Societies located in Counties where the establishment of County Health Departments is being considered

At the request of the Director of the Division of Tuberculosis of the State Department of Health, the Chairman of the Committee sent a letter to each County Society urging their cooperation in the campaign for early diagnosis of Tuberculosis sponsored by the National Tuberculosis Association. The response to this request has been most gratifying, and as a result twentytwo societies have, or are arranging meetings at which this particular activity will be considered. Undoubtedly, several societies have failed to notify this Committee of such action, and several county societies which hold infrequent meetings, are yet to be heard from It is therefore reasonable to suppose that the actual number is greater than the figures here reported

It cannot be too greatly stressed that it would tend for the best interests of the State Society if its Committee on Public Health and Medical Education received complete reports at all times of any accomplishments of the State Society itself, or the various County Societies in these fields. It is unfortunate that many County Societies have rather mactive Public Health Committees, while in a few County Societies no such Committee exists. These conditions should be properly corrected. Many County Societies fail absolutely to acknowledge any communications while other Counties with which the Committee has had considerable correspondence regarding special subject fail to make final reports.

Likewise, although a statewide campaign for immunization of all children against diphtheria is being carried on with the official endorsement of this Society your Committee has no knowledge concerning the progress of the work because it has received no information concerning it, though large reports of its activity have been given wide It is undoubtedly true also that much more is being accomplished in the various Counties in diphtheria immunization than we absolutely know, and County Medical Societies should adopt some means of making these reports more accurate and complete On the other hand, the Committee has received most excellent reports from the representatives of the Schenectady County Medical Society which indicate that four times as many children have been immunized in private practice as have received this treatment in While the total immunization in public clinics Schenectady County has not been large in comparison with other places where the "drive" method has been adopted, it is only fair to bear in mind that a large proportion of the immunization has been among pre-school children, and that the effort there is a much more sustained one than in places where the work is carried on That the result must be fairly satisfactory is indicated by the fact that there were no deaths from diphtheria in the City of Schenectady during the year 1927

Organization—The physical properties of the Committee were transferred to the office of the Chairman in Syracuse on July 1st Office space has been provided for the society gratuitously Stenographic service has been obtained on a part time basis for the greater part of the year With the exception of a small contingency fund for stenographic hire and other minor office expenses, the disbursement of funds for activities of the Committee has been made directly through the State Treasurer upon presentation of vouchers submitted to him by the Chairman of the Com-The expenses entailed by the lecturers in accepting an assignment from the Committee have been paid, and in addition the same honorarium fees as in the past have been presented to them as a mark of appreciation

The Committee has continued the plan of keeping a record of attendance and other data concerning the various lectures, and it is also getting information from the lecturers as to their opinion of the work after each lecture. From a review of the various activities engaged in by County Societies, it is the feeling of the Committee that organized medicine in the State of New York, as represented by the State Society, is taking a most active part in Public Health work and is well prepared to assume its rightful leadership in this direction.

The Chairman of the Committee is under deep obligation to the members of the Committee who have served during the present year. The gratitude of the State Society should be expressed to the various lecturers who at all times have been most willing to fulfill these obligations, and espe-

cially to the members of the profession, who by their advice and counsel have aided in outlining courses for the Committee to organize. The amount of time which many members of the profession have given to this work would surprise those who are unfamiliar with it. The Committee wishes to thank the officers, the Council and the Board of Trustees for the support and en-

couragement which has been given The Chairman is especially indebted for the cordial aid which he has received at all times from Dr Sadlier, Dr Dougherty and Dr Lawrence.

Respectfully submitted,

THOMAS P FARMER, Chairman

April 15, 1928

REPORT OF COMMITTEE ON MEDICAL ECONOMICS

To the House of Delegates— Gentlemen

The work of the Committee on Medical Economics has been concerned with

- 1 The activities of the Compensation Conference
- 2 The study of problems arising from the Workmen's Compensation Laws
- 3 The further development of Periodic Health Examinations among general practitioners

The Compensation Conference, established at the suggestion of the Industrial Survey Commission, and representing all the interests involved in the compensation situation, including the State Federation of Labor, the Associated Industries, representing employers, the Self-Insurers Association, representing self-insured employers, stock casualty companies, mutual casualty associations, the State Insurance Fund, organized medical societies, and the general public, has met at regular intervals since it was established in January, 1927, and has initiated various matters by way of improving and regularizing the compensation practice

The monthly meetings of these representatives, sitting around the common council table, discussing frankly and in confidence the various problems arising in their daily contacts cannot help but create a helpful influence and result in a better and more wholesome atmosphere surrounding the administration of the Workmen's Compensation Law

It was mevitable, therefore, that in such meetings matters relating to legislation should arise, and many meetings of the Conference have been devoted largely to consideration of proposed amendments to the compensation law

The Conference also has given much thought and study to the operation and effects of the medical provisions of the Workmen's Compensation Law Due to various conditions the practices under the law are not-satisfactory to the medical profession generally, nor always to the satisfaction of the employer or of the employee These conditions have undergone various changes

from time to time as the administration of the law has progressed, and it is believed that changes and new practices will take place with developments in the future

In order that the Industrial Commissioner and the Industrial Board may have the benefit of the counsel and advice of trained and experienced medical men, representative of the medical profession generally, and in order that the law and practices thereunder may be better understood by the medical profession generally, and by employers and employees, the Conference unantimously agreed to recommend to the Industrial Survey Commission an amendment to the Labor Law, whereby there shall be created in the Department of Labor, as an adjunct to the existing Industrial Council, a Medical Advisory Commistee composed of five physicians to be appointed by the Governor

It was the unanimous opinion of the Conference that such a Medical Advisory Committee could render important service in a truly advisory capacity by advising the Commissioner or the Industrial Board or Industrial Council on all matters of administration connected with the practice of medicine, by recommending such changes of administration or procedure from time to time as they might deem important and necessary from the medical viewpoint, and to consider the qualifications of all applicants for, or persons being considered for appointment in the Department of Labor in positions involving the practice of medicine.

This amendment as submitted was approved by the Industrial Survey Commission, and the bill was introduced in the Senate by Senator James S Truman, and in the Assembly by Assemblyman Edmund F Cooke The measure went safely through the Senate, but was killed in the Assembly Rules Committee during the last hours of the session. The reason presented for its defeat was a clause in the bill which entitled the members of the Medical Advisory Committee to the same compensation as members of the Council together with their traveling expenses, and that no provision had been made to appropriate a sum of money to cover these expenditures.

It is the opinion of your Committee that if this bill is redrafted and introduced early in the next session of the Legislature, it will become a law

In studying the problems arising from the Workmen's Compensation Law, a number of other amendments were proposed. Among those unanimously approved and recommended by the Conference to the Industrial Survey Commission, which relate to the practice of medicine, were the following

To define a reportable accident so that only those accidents which cause a loss of time or require medical treatment need be reported

To determine the proportionate loss of an arm or leg in case of amputation between the wrist and the elbow or the ankle and knee, so that in case of amputation at or above the wrist or ankle the loss shall be proportioned to the loss of arm or leg

To extend the time within which to file a claim for compensation in certain cases

To provide a new method of establishing the annual average earnings where the worker is injured in a seasonable employment

To include "Benzol Poisoning" among the occupational diseases

To make more certain the application of the occupational disease provisions to certain occupations involving the handling of such poisonous substances

To extend the limit of time within which a compensable occupational disease shall have been contracted

To enlarge the time within which notice of contracting of an occupational disease shall be

given to an employer

Through these Conference meetings your Committee has discussed with representatives of labor, industry, and the insurance companies many of our problems pressing for solution, and amicable agreements have been arrived at

The development of Periodic Health Examinations has been stimulated and accelerated through talks given at District Branch meetings by Dr C Ward Crampton, accompanied by a demonstration of the diagnostic procedure on a living subject. The value of Dr Crampton's work has been evidenced by continuous inquiries for literature and health examination blanks.

Your Committee recommends (a) that the Council of the State Medical Society appoint a Committee of Eight, to be composed of one physician from each District Branch Society to study more intimately the problems of the Workmen's Compensation Law and the necessity for the creation of a Medical Advisory Committee, (b) continuation of demonstrations at District Branch meetings of the proper methods of examining the apparently well

Respectfully submitted,

W WARREN BRITT, Chairman

April 15, 1928

REPORT OF THE COMMITTEE TO MAKE A STUDY OF HEART DISEASE

To the House of Delegates— Gentlemen

Your Committee reports further progress in the study of heart disease as affecting the public health of the State. The departments of the State dealing with various phases of statistics, with public health and with the supervision of hospitals have cordially cooperated and the Committee desires to express its appreciation of that very real assistance.

The information collected and presented in the studies is of the utmost importance to the physicians of this Society, as well as to the people of the State, in that it points the way to better care of those with heart disease. The application of standards for nomenclature and classifications will make for clarity of thought and action

The attention of the Committee has been directed particularly to the status of heart disease in the State with a few references to the United States Registration Area as a whole, in order to provide the background necessary and available for the proper realization of our own situation

The material gathered is presented under seven headings, as follows

A The study on mortality includes tables, charts and maps—forty-two in all

B Other diseases of the heart—eight tables and charts

C Heart diseases among the Foreign Born in New York State exclusive of New York City five tables and charts

D Hospitalization of heart cases in New York State showing cost per patient, morbidity and mortality

E Morbidity from heart disease in New York State

F Criteria 1 Nomenclature for diagnosis

2 Clinical diagnosis

3 Pathologic criteria for cardiovascular disease

4 Filing nomenclature.

G Recommendations

Following the general plan outlined in the

Resolution of the Council, December 9, 1926, your Committee has made some progress has accomplished certain definite studies, has planned certain others which will be mentioned, and has prepared recommendations for the action of the House of Delegates of the Society

There were enumerated in the Resolutions nine topics for study, as follows

- 1 Mortality from heart disease during the past twenty-five years
 - 2 Distribution of cases geographically
 - 3 Distribution of cases occupationally
- 4 Types of cardiopathy according to death certificates
- 5 Types of cardiac disease diagnosed in hospital patients of entire State in any one year
 - 6 Etiology
 - 7 Therapy Medicinal, Physical, Occupational
 - 8 Prognosis
 - 9 Recommendations

The topics have been considered and studied as follows

1 Mortality of heart disease in the State, exclusive of New York City, has been studied from original sources in the records of the Division of Vital Statistics in the State Department of Health Reference is made to the study of mortality for the City of New York published by the New York Tuberculosis and Health Association The two studies are not wholly comparable as the method of tabulating the data differ Comparison may be made directly with similar material gathered by the American Heart Association since the method of recording and tabulation is the same

The statistics previous to 1915 have not been analyzed since they were not recorded or tabulated in a comparable manner

The studies of mortality include the following Exhibit A, Tables and Charts I to XI

Death rates from ten numbers of the International List of Causes of Death, 1917 to 1926

Mortality rates of the four numbers of the International List grouped as "heart disease" contrasted with the mortality rates of six other numbers of allied causes of death for ten years In this way the trend of these causes of death was shown

The rates of the ten chief causes of death, compared with the rates of the four numbers of heart disease considered as one

The death rates of heart disease by months for the ten years, 1916 to 1927, contrasted with the death rates from respiratory diseases and deaths from all causes for the same periods

The deaths by small (five year) age groups of 1915 and 1925 for six leading causes of death

The deaths from heart disease and those from all causes by small age groups for both sexes

The cumulative distribution of age groups by five year intervals of heart disease for 1915 and 1925 with all deaths and the population for 1925

The heart disease deaths and death rates for 1925 with average annual deaths and rates for five year periods, 1916 to 1920 and 1921 to 1925

Deaths and death rates from heart disease by age groups for 1915 and 1925 with per cent change in the ten year period

The average annual deaths and rates for two five year periods with the per cent change

Deaths and rates per 100,000 from heart disease by sex for ten years, 1916 to 1925

Death rates from heart disease by age and sex for 1916 and 1925

The percentage distribution of types of heart disease by age groups for 1925

These thirteen studies show many important details of which the following may be empha-

Of the four titles under which deaths considered as due to heart disease are tabulated—two, Angina Pectoris and Other Diseases, show definite and persistent increases, while Pericarditis and Endocarditis and Myocarditis Acute show Pericarditis accounts for 03% steady declines of the deaths from heart disease, Endocarditis and Myocarditis (Acute) account for 38%, and Angina Pectoris accounts for 74% That is, all three together account for only 115% of the deaths from heart disease, while 885% are in the "scrap basket," Other Diseases of the Heart. This uneven distribution shows the need of a revision of the methods of the classification Grouped together, these four titles are described as Heart Lisease and form the leading cause of death in the State It accounts for 21% of the deaths in the State, and its death toll exceeds the combined mortality of cancer and tuberculosis In the United States Registration Area only fitteen per cent (15%) of deaths are charged to heart disease New York State stands next to Vermont at the top of the list of States in the death The proportion of deaths rate of heart disease charged to heart disease in the State is five per cent greater than in the country as a whole and has been increasing in proportion each year dur-The death rate of respiing the past ten years ratory diseases in the same period has been de-Heart disease is the leading cause of creasing death in the school age, 5 to 14, and is exceeded in the ages 14 to 34 by tuberculosis per cent of the deaths from heart disease occur before age of 45 and fifty per cent of the deaths Half the from heart disease before age 70 deaths from All Causes occur under age 60 That is, half the deaths from heart disease do not occur until ten years later than half of all deaths During the past ten years there has been a definite increase of deaths from heart disease in the older age groups This is particularly true

after age 40 There is some evidence to show that the rate of deaths of males is increasing and at a greater rate than the death rate of women

2 The distribution of mortality by geographical units has been shown by

Exhibit A Tables and Charts XII to XVII Rates in urban and rural districts of the State

Death rates per 100,000 for cities of over 25,-000 population

Death rates of Counties of the State between 1917 and 1926

Death rates by Counties with per cent change between 1917 and 1926 arranged by order of changes

Mortality from heart disease in each Borough of the City of New York

Deaths from heart disease as per cent of all deaths by counties in order of rank

Death rates per 1,000 population from All Causes by Counties 1916 to 1925

The small number of deaths in the population units does not permit of extended inferences from the actual figures. This study should be extended by a careful study of the local conditions in each County as to age, sex, race and occupation.

- 3 There is little material available on the morbidity Exhibit C and E, or mortality in industry, but what small fragments from the various age groups there are, show a rather high incidence Time has not permitted the study of a large sample of population for the morbidity and for the racial groups by age and sex. Employers of labor should find a way to institute the physical examination of all employees, not only for the protection of the industry, but also for the better placement of the heart-impaired laborer. In this manner the individual will be assisted to continue self-supporting and not become an economic burden on family or community
- 4 and 5 The types of cardiopathy according to death certificates and as diagnosed in hospital patients, Exhibit D of any one year are the same and are designated in terms devoid of any indication of the etiology. The structural defects and chronic inflammatory changes account for over 75% of the diagnoses of heart disease. This is shown in Exhibit B the Study of "90 Other Diseases of the Heart". Because of these findings the Committee has recommended the general adoption of standards of nomenclature diagnostic criteria and pathological findings—Exhibit F

In order that the standard diagnoses may be recorded and tabulated so as to be available for further study, it has been recommended that the hospitals adopt the suggested amendments to the procedures of history or case filing already in use. To better understand the relation of the etiology of heart disease to the public health, it is essential to guther more facts and knowledge. It is

urged that physicians state the etiology together with other elements of the diagnoses in order that the Bureau of Vital Statistics may record and tabulate the same for future report and study

The records of hospital autopsies offer a source of information on etiology, a comparison of diagnoses, both clinical and pathological, and a possible proportionate relation to the death certificate mortality as tabulated in statistical departments.

- 6 It was not possible with the limited funds to initiate the study of the etiology of the various groups and the methods of prevention of heart disease
- 7 As to the therapy of heart disease, attention is called to the importance of an early diagnosis of the etiology and its thorough and prolonged treatment. This is particularly applicable to the specific treatment of lues. The prolonged treatment is also applicable to the rheumatic infections of the heart. More beds are required for the rest treatment of rheumatic heart disease and for the relief of the permanently incapacitated. These may become available if tuberculosis continues to decrease and beds in the present tuberculosis hospitals are then used for heart disease.
- 8 As to prognosis in individual cases, no suggestions are available at this time, but the outlook from the public health viewpoint is, that more deaths each year are being charged to heart disease. The majority of deaths from this disease has a central age of 70 years. This exceeds the middle point of death from All Causes by ten years. It is suggested from the study that with the increasing life expectancy more people live to die in more advanced ages from chronic changes in the heart. The discovery and application of methods effective in slowing this process will further postpone death and add to the number of deaths in the older age groups.
- 9 Recommendations See Exhibit G of this Report

Exhibit G-Recommendations

a In order to have a common viewpoint there was evident need of having accepted criteria for diagnosis by clinical evidence, therefore, after review, the criteria devised by the New York Heart Committee were adopted Exhibit F-1 and 2

The Committee recommends That the House of Delegates approve this action of the Committee and urge the members of the Society to employ the criteria Exhibit F-1, 2, 3 and 4

b The study of death certificates as filed reveals the necessity of using standard criteria and the Committee, therefore, recommends That, the House of Delegates urge the members of the Society and the profession throughout the State to fill out death certificates with a statement of the etiology, changes in anatomical structure and physiological function, as well as the condition of

the process as active or inactive, acute or chronic

In order that certificates made in the manner suggested shall be tabulated it is recommended to the House of Delegates to request the Bureau of Vital Statistics of the State Department of Health to devise a method by which death certificates containing a statement of the etiology of the heart disease may be tabulated under the proper headings

The review of the method of tabulating the death certificates as filed developed the fact that there are certain deficiencies in the present classification and the Committee, therefore, recommends That, the House of Delegates request the United States Census Bureau to consider the present classification of the group numbers relating to heart disease in the International List of the Causes of Death and devise a method more in keeping with the present knowledge of etiology and pathology *

The effort to study heart disease as occurring in those employed in the industries of the State developed the fact that few observations are made and few recorded in a way to be of use in such a research, the Committee, therefore, recommends That, the House of Delegates urge the members of the Society and others engaged in industrial medicine to record observations on employed persons in a systematic manner and to adopt a method of estimating and classifying the ability of the individual with heart disease to

The replies from the hospitals of the State to the questionnaire in only a few instances gave the etiology of the heart deaths. As the hospitals of the State employ usually one of three methods of tabulating diagnoses of patients, these methods have been reviewed and revisions suggested It is, therefore, recommended That, the House of Delegates urge Attending Physicians of hospitals to include the etiology of cardiac condition in the official diagnosis in order that the recording

office of the hospital may tabulate the etiology and the interne staff may insert the etiology in the death certificates

All of which is respectfully submitted by the Committee

REPORT OF COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates-Gentlemen

The Committee on Medical Research desires to report, that during the current session of the Legislature Mr Vaughan introduced Assembly Bill Int No 33 to amend the Penal Law to prevent experiments of any kind on living dogs

Your Committee induced public spirited citizens as well as educators generally to protest its enactment The hearing on the proposed measure was held in Albany on February 14th, and our position was made clear to the Codes Committee by Dr Sunon Flexner of the Rockefeller Insti-

tute, Dr Horatio B Williams of the College of Physicians and Surgeons, and Dr J E Sweet of Cornell Medical College, who kindly consented The bill died in Comto render this service mittee

Federated anti-vivisection societies of the United States are sponsoring a bill to be introduced in Congress much like the one previously Your Committee has made every efmentioned fort to date to place on record the reasons for our objection to its passage

Respectfully submitted, FREDERICK E SONDERN, Chairman April 15, 1928

 $^{{}^{\}bullet}$ Revision suggested by the Committee shown in parallel columns, as follows

REPORT OF COMMITTEE ON PUBLIC RELATIONS

Γο the House of Delegates— Gentlemen.

Your Committee on Public Relations begs leave to offer the following report of its activities for the past year

It has been in conference five different times The first conference was in during the year June, soon after the annual meeting mittee was organized and a tentative program for the year adopted It also considered the work of your special committee last year and decided to follow the suggestions made in that committee's report It proposed to ask every County Society to organize a Committee on Public Relations, and outlined what the duties and functions of such a This outline it directed its committee might be secretary to send to the Secretary of each County Society As a program for the year it proposed to confer with representatives of the State Department of Health, Education and Mental Hygiene, of the Red Cross and of the Association for the Prevention of Cancer At that same meeting there was considerable thought given to the type of publicity that emanates from lay agencies concerning public health activities In all of these the work of the private physician has never been properly evaluated nor described thought that probably the Committee could, in its discussions with lay agencies, find a way of suggesting how their reports might be more considerate of the aid rendered them by the resident practising physician

On September 27th a special meeting of the Committee was called in Hornell for the purpose of conferring with a representation from Cattaraugus County on the situation that had arisen between the physicians of the County Society and the officers of the Milbank Demonstration Committee was much impressed by the representatives from Cattaraugus County with regard to the seriousness of the situation into which the practice of medicine had been thrown by the demonstration in public health, and it was resolved that a conference should be arranged by your Committee with representatives of the State Charities Aid Association for the purpose of having the disagreeable conditions prevailing in the county removed Unfortunately, great difficulty was experienced in putting into concrete form the many facts of unpleasantness and unfairness experienced by the physicians of Catta-The result of this joint conferraugus County ence was not very fruitful and the Committee decided to call a third conference, to which representatives of both the State Charities Aid Association and the Cattaraugus County Medical Society should be invited. This conference was held

in Olean in early November We regret to say that our efforts here were attended with no better success than in the two previous conferences Your Committee was seriously handicapped in its effort to unearth and correct the difficulties which were interfering with the practice of medicine in that county by the decision of the representatives of the County Society not to confer with the representatives of the State Charities Aid Associa-Your Committee again heard representatives of both sides individualy, but to no advan-It was a great disappointment to every member of your Committee that it had not been successful in bringing the two organizations together It has always had the greatest sympathy for the members of the Cattaraugus County Society and has felt that they have been mistreated in a number of ways, but it proved impossible to make its services appear valuable to the representatives of the County Society

Your Committee, realizing that it could go no further, suggested to the President of the State Society that the matter be considered at a special meeting of the Council, from which time the situation has been a special consideration of the Committee of the Council

The Committee on Public Relations, in addition to the joint conferences already mentioned. held a conference in June with the representatives of the State Charities Aid Association for the purpose of confirming the work that the special committee of the previous year had done with this Association, and in December the Committee conferred with Commissioner Nicoll with regard to the promotion of a closer cooperation and a more definite mutual interest between the Department of Health and the practising physician. At this conference the subjects of the county health unit and the child welfare clinics were discussed. The Commissioner assured the Committee that it was his ambition to have the activities of his Department closely related with the work of the practising physician, realizing that in this way the public would receive the maximum of public health service. Other subjects were named that were to be discussed at a future conference

Owing to the unsettled condition in Cattaraugus County and the far reaching effect that an adjustment there might have on the relations of the Medical Society with other units in the State, further conferences were indefinitely postponed until the disturbing factors there should be satisfactorily eliminated

Your Committee has received much encouragement from the County Societies It is not aware of the actual number of County Societies that have created Committees on Public Relations, but believes that quite a large number have done so

the process as active or mactive, acute or chronic.

In order that certificates made in the manner suggested shall be tabulated it is recommended to the House of Delegates to request the Bureau of Vital Statistics of the State Department of Health to devise a method by which death certificates containing a statement of the etiology of the heart disease may be tabulated under the proper headings

d The review of the method of tabulating the death certificates as filed developed the fact that there are certain deficiencies in the present classification and the Committee, therefore, recommends That, the House of Delegates request the United States Census Bureau to consider the present classification of the group numbers relating to heart disease in the International List of the Causes of Death and devise a method more in keeping with the present knowledge of etiology and pathology *

The effort to study heart disease as occurring in those employed in the industries of the State developed the fact that few observations are made and few recorded in a way to be of use in such a research, the Committee, therefore, recommends That, the House of Delegates urge the members of the Society and others engaged in industrial medicine to record observations on employed persons in a systematic manner and to adopt a method of estimating and classifying the ability of the individual with heart disease to

The replies from the hospitals of the State to the questionnaire in only a few instances gave the etiology of the heart deaths. As the hospitals of the State employ usually one of three methods of tabulating diagnoses of patients, these methods have been reviewed and revisions suggested It is, therefore, recommended That, the House of Delegates urge Attending Physicians of hospitals to include the etiology of cardiac condition in the official diagnosis in order that the recording

office of the hospital may tabulate the etiology and the interne staff may insert the etiology in the death certificates

All of which is respectfully submitted by the Committee

REPORT OF COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates-Gentlemen

The Committee on Medical Research desires to report, that during the current session of the Legislature Mr Vaughan introduced Assembly Bill Int No 33 to amend the Penal Law to prevent experiments of any kind on living dogs

Your Committee induced public spirited citizens as well as educators generally to protest its enactment The hearing on the proposed measure was held in Albany on February 14th, and our position was made clear to the Codes Committee by Dr Simon Flexner of the Rockefeller Insti-

tute. Dr Horatio B Williams of the College of Physicians and Surgeons, and Dr J E Sweet of Cornell Medical College, who kindly consented to render this service. The bill died in Committee

Federated anti-vivisection societies of the United States are sponsoring a bill to be introduced in Congress much like the one previously Your Committee has made every efmentioned fort to date to place on record the reasons for our objection to its passage

Respectfully submitted, Frederick E Sondern, Chairman April 15, 1928

^{*}Revision suggested by the Committee shown in parallel columns as follows

In 1926 one Trustee shall be elected for five years, one for four years, one for three years, one for two years and one for one year and thereafter, one trustee shall be elected annually for a period of five years and in the event of a vacancy a Trustee shall be elected for the unexpired term

ARTICLE VII

Censors

The President, the Secretary and eight district councilors shall be known as the Board of Censors of the Society

Five Censors shall constitute a quorum The President and Secretary shall be the President and Secretary, respectively, of the Board but without vote

The Board of Censors shall meet upon the call of the President The Secretary shall prepare and submit the report of the Board of Censors to the House of Delegates

ARTICLE VIII

Meetings

The Annual and the Intermediate Stated Meetings of the Society or of the House of Delegates shall be held at the time and the place designated by the House of Delegates The Council for sufficient cause, may change the time and the place of such meetings, provided the House of Delegates is not in session

ARTICLE IX.

Funds

Funds shall be raised by an annual per capita assessment on each component county society at a uniform per capita rate throughout the State Funds may also be raised in any other manner approved by the House of Delegates or by the Council when the said House of Delegates shall not be in session. No funds of the Society shall be expended for any purpose except by the authority of a resolution of the Board of Trustees nor shall any indebtedness be incurred by any officer, Committees or members of Committees of the Society as a charge against the Society until the same shall have been approved by the Board of Trustees

ARTICLE X Referendum

At any annual or stated meeting of the Society or of the House of Delegates a majority of the members present may order a referendum on any question consistent with the Constitution and By-Laws and in accordance with such regulations respecting the submission of the question as the House of Delegates or the Council may prescribe. The members shall vote thereon

by mail The poll shall be closed at the expiration of fifteen days after mailing the question, and if the members voting shall comprise a majority of all the active members of the Society, a majority of such vote shall determine the question and be binding on the Society and the House of Delegates

ARTICLE XI

District Branches

Sec 1 The membership of the Society shall be divided into eight district branches, as follows

The First District Branch shall comprise the members of the Medical Societies of the Counties of New York, Bronx, Westchester, Rockland, Putnam, Orange, Dutchess and Richmond

The Second District Branch shall comprise the members of the Medical Societies of the Counties of Kings, Queens, Nassau and Suffolk

The Third District Branch shall comprise the members of the Medical Societies of the Counties of Albany, Rensselaer, Schoharie, Greene, Columbia, Ulster and Sullivan

The Fourth District Branch shall comprise the members of the Medical Societies of the Counties of St Lawrence, Franklin, Clinton, Essex, Hamilton, Fulton, Montgomery, Schenectady, Saratoga, Warren and Washington.

The Fifth District Branch shall comprise the members of the Medical Societies of the Counties of Onondaga, Oneida, Herkimer, Oswego, Lewis, Madison and Jefferson

The Sixth District Branch shall comprise the members of the Medical Societies of the Counties of Otsego, Delaware, Chenango, Cortland, Tompkins, Schuyler, Cheming, Tioga, Broome and Steuben

The Seventh District Branch shall comprise the members of the Medical Societies of the Counties of Monroe, Wayne, Cayuga, Seneca, Yates, Ontario and Livingston

The Eighth District Branch shall comprise the members of the Medical Societies of the Counties of Erie, Niagara, Orleans, Genesee, Wyoming, Allegany Cattaraugus and Chautauqua

Sec 2 Each District Branch may adopt a constitution and by-laws for its government and may amend the same, but before becoming effective they shall be approved by the Council They shall be consistent with the Constitution and By-Laws of this Society

ARTICLE XII

County Societies

The terms county medical society and component county medical society shall be deemed to include all county medical societies now in affiliation with this Society or which may hereafter be organized and chartered by the House of Delegates It also has been informed that some of these have already justified their existence in the value of the work they have done

On the whole, the Committee believes that the practice of medicine and the practitioner are both receiving greater consideration from the public

today than they have enjoyed in recent years, and the Committee feels that, in some measure, it has contributed to the promotion of this condition

Respectfully submitted.

George M Fisher, Chairman

April 15, 1928

REPORT OF THE COMMITTEE TO REVISE THE CONSTITUTION AND BY-LAWS

To the House of Delegates—Gentlemen

The Committee appointed by the President to Revise the Constitution and By-Laws in accordance with the resolution of the House of Delegates, May 9, 1927, begs leave to submit the following

Respectfully submitted,

Samuel J Kopetzky, Charman

April 15, 1928

CONSTITUTION

ARTICLE I

Purposes of the Society

The purposes of the Society shall be to federate and bring into one compact organization the medical profession of the State of New York, to extend medical knowledge and advance medical science, to elevate the standard of medical education, to secure the enactment and enforcement of just medical laws, to promote friendly intercourse among physicians, to guard and foster the material interests of its members, and to protect them against imposition, and to enlighten and direct public opinion in regard to the great problems of medicine

ARTICLE II

Membership

The membership in this Society shall be divided into three classes (a) active, (b) retired, and (c) honorary

ARTICLE III

House of Delegates

The House of Delegates shall be the legislative body of the Society, shall be charged with the general management, superintendence and control of the Society and its affairs and shall have such general powers as may be necessarily incident thereto, except as otherwise specifically provided by the Constitution or By-Laws It shall pass upon the credentials and qualifications of delegates and shall finally decide who

are entitled to be members of the House of Delegates It shall have power and authority to suspend or otherwise discipline its own members, district branches, component county medical societies or any member of the Society, charged with special duties for and under authority of the State Society It shall provide for a division of the scientific work of the Society into appropriate sections, for the organization of the District Branches, for rules and regulations for its own government and for the administration of the affairs of the Society may delegate any of the affairs of the Society to the Council with power and authority to act thereon while the House of Delegates is not in session

ARTICLE IV

Council

The Council shall be composed of (a) officers of the Society, (b) chairmen of the standing committees, (c) the Editor-in-Chief, (d) the retiring President for a term of one year after his term of office expires

ARTICLE V

Officers

The officers of the Society shall be a President, a President-elect, two Vice-Presidents, a Secretary, an Assistant Secretary, a Treasurer, an Assistant Treasurer, a Speaker and a Vice-Speaker of the House of Delegates, five Trustees, and one Councilor from each District Branch, who shall be the President thereof He shall be elected by the District Branch in which he resides for a term of two years. The officers, except the councilors, shall be elected for one year or until their successors have been duly chosen. They shall take office at the termination of the annual meeting.

ARTICLE VI

Trustees

The Board of Trustees shall consist of five members elected as such Trustees and the President, the Secretary and the Treasurer shall be members of the Board of Trustees with voice but without vote Sec 5 It shall provide for the issue of charters to county societies in affiliation with the Society

Sec. 6 It shall have authority to appoint special committees from among members of the Society

Sec 7 The following shall be the order of business at the sessions of the House of Delegates

- 1 Calling the meeting to order
- 2 Report of Reference Committee on Credentials
- 3 Roll call by the Secretary
- 4 Reading of the minutes of the previous meeting
- 5 Address of the President
- 6 Address of the Speaker
- 7 Report of the Council
- 8 Report of Trustees
- 9 Report of the Board of Censors
- 10 Report of the Secretary
- 11 Report of the Treasurer
- 12 Report of Councilors
- 13 Reports of the standing committees
- 14 Reports of the special committees
- 15 Reports of reference committees
- 16 Unfinished business
- 17 New business

CHAPTER III

Election of Officers

Sec. 1 The officers, Trustees and chairmen of standing committees of the Society, to be elected by the House of Delegates, shall be elected at an adjourned session of the annual meeting of the House of Delegates, which adjourned session shall be held at a convenient hour on the first day of the annual meeting of the Society. No member of the Society shall be eligible for any office, or entitled to vote for any officer, Trustee, chairman of standing committees or delegates, who is in arrears for county dies and State Society per capita assessment.

Sec 2 The first order of business on the day designated in the preceding section shall be the nominations for officers, trustees, chairmen of standing committees, delegates to the American Medical Association and the appointment of a sufficient number of tellers by the Speaker After all nominations shall have been made the Secretary shall cause to be displayed in full sight of the delegates a list of nominees for each office arranged in alphabetical order, and shall also cause to be distributed a sufficient number of blank ballots for the use of the House of Delegates These ballots shall have printed or stamped thereon the appropriate headings for

each office with spaces thereunder in which may be written the name of the candidate or candidates to be voted for.

Sec 3 All elections for such offices shall be by ballot, each member depositing his ballot on roll call individually. In the event of a single nominee only for any office, a majority vote without ballot shall elect. In case no nominee for an office receives a majority of votes on the first ballot the nominee receiving the lowest number of votes shall be dropped and a new ballot taken for that office. This procedure shall be continued until one of the nominees receives a majority of the votes cast when he shall be declared elected.

Sec 4 The following method shall govern the election of delegates to the American Medical Association. Nominations shall be made for not less than double the full number of delegates to be elected, and the delegates shall be declared elected in the order of the highest number of votes cast until the allotted number shall have been chosen, a corresponding number in the next highest order of votes cast shall be declared alternate delegates.

Sec 5 The delegates to the American Medical Association shall be elected in the calendar year preceding the meeting of the House of Delegates to which they are elected and in accordance with the Constitution and By-Laws of that body Delegates may be elected to other medical societies or similar bodies as the interests of the Society may require, and credentials shall be issued to all delegates, signed by the President and Secretary

Sec. 6 A delegate shall not be considered in good standing or entitled to vote in the House of Delegates if the component county medical society by which he was chosen is in default in the payment of any dues or assessments imposed by the House of Delegates or if such component county medical society shall at the time be under sentence of suspension imposed by the House of Delegates, or if such delegate is not in good standing in this Society, or in the component county medical society to which he belongs. The term of a Delegate elected by a County Medical Society shall begin at the first annual meeting of the House of Delegates subsequent to his election.

CHAPTER IV

Council

Sec 1 The Council shall meet at the close of the annual meeting of the House of Delegates to organize for the ensuing year and shall continue in office until their successors are elected and qualified

Sec. 2 It shall meet twice a year, the time and place to be selected by the President, and it

There shall be but one county medical society in each county affiliated with this Society

ARTICLE XIII

Amendments

Amendments to this Constitution, except such as are obligatory by law, shall be made only at an annual meeting of the House of Delegates

Notice of the proposed amendment shall be given at a previous annual meeting of the House of Delegates, and before the same can be acted upon, it shall be published once before the annual meeting in the official publication of the Society

A two-thirds vote of the delegates present and

voting shall be necessary for adoption

Amendments made necessary by law shall be made either by the Council or House of Delegates whenever such necessity exists

BY-LAWS

CHAPTER I

Membership

- Sec 1 The active members shall be all members in good standing of the component county medical societies A copy of the roster of such members certified to be correct by the Secretary of such county society shall be evidence of the right of the members whose names appear therein to membership in this Society No applicant shall be eligible to membership until he has established that he is of good moral and professional character and reputation, and that admission would not be prejudicial to the best interest of the Society No member who has been dropped from the roll of a component county society by reason of failure to pay dues shall be accepted by another society except by regular transfer after reinstatement in the original so-
- Sec 2 Any member suspended or expelled from a component county society shall likewise be suspended for the same period or expelled from this Society. Any member suspended or expelled from this Society shall likewise be suspended for the same period or expelled from a component county society. His right of appeal to this Society shall not be impaired nor shall such appeal prevent the carrying out of the judgment of the county society pending such appeal. Any member not in good standing in his county society shall not be a member in good standing in this Society, and any member ceasing to be a member of his county society shall also cease to be a member of this Society.
- Sec 3 Retired members of this Society shall be active members of component county societies, seventy years of age or over, who have applied for such retired membership. All such

applications shall be signed by the President and the Secretary of the county society of the applicant and then sent to the Secretary of this Society for presentation to the House of Delegates for approval Retired members desiring to become active members shall apply for such membership to the component county society in the county of the residence of the applicant Such applications shall be governed by the constitution and by-laws of the component county society relative to active membership

Sec 4 The honorary members of the Society shall be all persons now on the roster as such and in addition such distinguished physicians residing outside of the State of New York as may hereafter be elected. All nominations for honorary membership must be endorsed by three members of the Society and forwarded to the Secretary for presentation to the House of Delegates, which by a two-thirds vote of the delegates voting shall be declared elected honorary members of this Society, provided the nomination shall have been made at a previous annual meeting.

Sec 5 Honorary and retired members shall be entitled to the privilege of attending and addressing the meetings of the Society, but shall not be accorded the other rights and privileges of membership or be subject to assessment

CHAPTER II

House of Delegates

- The House of Delegates shall be composed of (a) Delegates elected by the component county medical societies, (b) officers of the Society, (c) chairmen of standing committees, and (d) the past presidents and past secretaries of the Society who shall be life members with voice but without vote, (e) The Trustees shall be members with voice but without vote Each component county society shall be entitled to elect as many delegates as there shall be State Assembly Districts in such county at the time of the election, and each component county medical society shall be entitled to elect at least one A component society representing by its name more than one county shall be entitled to as many delegates as there are Assembly Districts in the counties named in the title of such society
- Sec 2 The annual meeting of the House of Delegates shall be held on the day before the annual meeting of the Society The sessions of the House of Delegates may be adjourned from time to time as may be necessary
- Sec 3 Thirty delegates shall constitute a quorum
- Sec 4 It shall hear and finally determine all appeals taken from decisions of the Board of Censors

- Sec 5 It shall provide for the issue of charters to county societies in affiliation with the Society
- Sec 6 It shall have authority to appoint special committees from among members of the Society
- Sec 7 The following shall be the order of business at the sessions of the House of Delegates
 - 1 Calling the meeting to order
 - 2 Report of Reference Committee on Credentials
 - 3 Roll call by the Secretary
 - 4 Reading of the minutes of the previous meeting
 - 5 Address of the President
 - 6 Address of the Speaker
 - 7 Report of the Council
 - 8 Report of Trustees
 - 9 Report of the Board of Censors
 - 10 Report of the Secretary
 - 11 Report of the Treasurer
 - 12 Report of Councilors
 - 13 Reports of the standing committees
 - 14 Reports of the special committees
 - 15 Reports of reference committees
 - 16 Unfinished business
 - 17 New business

CHAPTER III

Election of Officers

Sec 1 The officers, Trustees and chairmen of standing committees of the Society, to be elected by the House of Delegates, shall be elected at an adjourned session of the annual meeting of the House of Delegates, which adjourned session shall be held at a convenient hour on the first day of the annual meeting of the Society. No member of the Society shall be eligible for any office, or entitled to vote for any officer, Trustee, chairman of standing committees or delegates, who is in arrears for county dues and State Society per capita assessment.

Sec 2 The first order of business on the day designated in the preceding section shall be the nominations for officers, trustees, chairmen of standing committees, delegates to the American Medical Association and the appointment of a sufficient number of tellers by the Speaker After all nominations shall have been made the Secretary shall cause to be displayed in full sight of the delegates a list of nominees for each office arranged in alphabetical order, and shall also cause to be distributed a sufficient number of blank ballots for the use of the House of Delegates These ballots shall have printed or stamped thereon the appropriate headings for

each office with spaces thereunder in which may be written the name of the candidate or candidates to be voted for

- Sec 3 All elections for such offices shall be by ballot, each member depositing his ballot on roll call individually. In the event of a single nominee only for any office, a majority vote without ballot shall elect. In case no nominee for an office receives a majority of votes on the first ballot the nominee receiving the lowest number of votes shall be dropped and a new ballot taken for that office. This procedure shall be continued until one of the nominees receives a majority of the votes cast when he shall be declared elected.
- Sec 4 The following method shall govern the electron of delegates to the American Medical Association. Nominations shall be made for not less than double the full number of delegates to be elected, and the delegates shall be declared elected in the order of the highest number of votes cast until the allotted number shall have been chosen, a corresponding number in the next highest order of votes cast shall be declared alternate delegates.
- Sec 5 The delegates to the American Medical Association shall be elected in the calendar year preceding the meeting of the House of Delegates to which they are elected and in accordance with the Constitution and By-Laws of that body Delegates may be elected to other medical societies or similar bodies as the interests of the Society may require, and credentials shall be issued to all delegates, signed by the President and Secretary
- Sec. 6 A delegate shall not be considered in good standing or entitled to vote in the House of Delegates if the component county medical society by which he was chosen is in default in the payment of any dues or assessments imposed by the House of Delegates, or if such component county medical society shall at the time be under sentence of suspension imposed by the House of Delegates, or if such delegate is not in good standing in this Society, or in the component county medical society to which he belongs. The term of a Delegate elected by a County Medical Society shall begin at the first annual meeting of the House of Delegates subsequent to his election.

CHAPTER IV

Council

- Sec 1 The Council shall meet at the close of the annual meeting of the House of Delegates to organize for the ensuing year and shall continue in office until their successors are elected and qualified
- Sec. 2 It shall meet twice a year, the time and place to be selected by the President, and it

shall meet at other times upon the request in writing of five members of the Council, or upon the call of the President

- Sec 3 Seven members shall constitute a quorum
- Sec 4 The Council shall be the executive and administrative body of the Society and shall control all arrangements for the annual meeting, shall elect an Executive Committee of the Council to carry on during the interim between the regular meetings of the Council the affairs and the business of the Society. Its action shall be governed by the Constitution and By-Laws of the Society and the rules and regulations of the House of Delegates. It shall have power to employ legal counsel
- The Council shall take such action as is necessary to carry out the Constitution and By-Laws and to give full effect to any resolu-tion or vote of the House of Delegates It shall also have power to legislate as a House of Delegates, when the latter is not in session, on all matters consistent with the Constitution and By-Laws Such legislative action of the Council shall not become effective or binding on the Society until approved by a majority of a referendum vote of the House of Delegates, provided a majority of the House of Delegates vote thereon within fifteen days after the mailing of the question submitted for referendum Secretary shall send the question for referendum vote to all the members of the House of Delegates

The Council shall have power to fill any vacancies which may occur in any elective office not otherwise provided for, until the next annual meeting of the House of Delegates

Sec 6 The standing or special committees of the Society shall report to the Council and shall be subject to the jurisdiction of the Council at all times when the House of Delegates shall not be in session

Sec 7 The following shall be the order of business at meetings of the Council

- 1 Calling the meeting to order
- 2 Roll call by the Secretary
- 3 Reading of minutes
- 4 Communications
- 5 Reports of chairmen of standing and special committees
- 6 Unfinished business
- 7 New business

CHAPTER V

Executive Committee

Sec 1 At its first regular meeting the Council shall choose by a majority vote five members of the Council, three of whom shall be coun-

cillors, who together with the President, the Secretary, the Treasurer and the immediate Past President shall constitute the Executive Committee Candidates for election to the Executive Committee shall be nominated by the President, but other candidates may be nominated by any member of the Council Executive Committee shall hold office until the following annual meeting of the Council or until their successors shall be duly chosen ecutive Committee shall, when elected, organize immediately and elect a Chairman, a Vice-Chairman and a Secretary The Executive Committee shall hold regular meetings at times and places that shall be fixed by the Chairman and any two members of the Executive Committee may require the Chairman thereof to call a meeting for such time and place as shall be designated by them in writing, of which the members shall have at least two days' notice Five members shall constitute a quorum. It shall prepare a budget to be acted upon by the Board of Trustees

Sec 2 The following shall be the order of business at meetings of the Executive Committee

- 1 Calling the meeting to order
- 2 Roll Call
- 3 Reading of minutes
- 4 Communications
- 5 Report of committees
- 6 Unfinished business
- 7 New business

The Executive Committee shall superintend all publications of the Society and their distribution and shall have authority to appoint an editor and such assistants as it may deem necessary and provide for the publication of official pronouncements of component county societies when requested by said society The Executive Committee shall have such other powers and duties as may be delegated to it from time to time by the Council It shall act as adviser to the legal counsel of the Society in suits brought against members of the Society for alleged malpractice It shall, with the aid of the legal counsel, examine the Constitution and By-Laws of component County Societies and District Branches, and all amendments thereto which may be submitted to the Council for approval and shall report to the Council its approval or disapproval The Chairman of the Executive Committee may order or any two members of the Committee may require the Chairman to order a referendum vote of the Council on any question that may come before the Executive Committee and members of the Council may vote The poll on the thereon by mail or telegram question so submitted shall be closed at the expiration of one week after the mailing of the

question and if the members of the Council voting shall comprise a majority of all the members of the Council, a majority of such vote shall determine the question and be binding upon the Council and the Executive Committee

- Sec 4 In case of any vacancy in the Executive Committee through death, resignation, disqualification or other case, the President shall appoint a successor to fill such vacancy until the next meeting of the Council
- Sec 5 The Executive Committee shall have charge of the administrative and business affairs of the Society while the Council is not in session, and may adopt rules and regulations not repugnant to the Constitution and By-Laws of the Society or to the rules, regulations or orders of the House of Delegates or of the Council

CHAPTER VI

Trustees

- Sec 1 At the first meeting of the Board of Trustees following the annual meeting of the House of Delegates, it shall organize under the chairmanship of the senior member and fix the time and place of its regular meetings. Any three members of the Board of Trustees may require the Chairman to call a special meeting at the office of the State Society for such time as shall be designated by them in writing and of which the members of the Board shall have at least seven days notice.
- Sec. 2 The Board of Trustees shall have charge of all property including trust funds and shall manage the financial affairs of the Society and shall invest the surplus from time to time. The budget prepared by the Executive Committee shall be submitted to the Board for its approval and all resolutions or recommendations of the House of Delegates, Council or Executive Committee pertaining to expenditure of money must be approved by the Board of Trustees before the same shall become effective. The fiscal year shall begin July 1st and end June 30th of the following year.
- Sec 3 All moneys of the Society received by the Board of Trustees, Council or any member or agent thereof shall be paid to the Treasurer of the Society. The Board of Trustees shall approve the bond of the Treasurer as to amount, form and surety, it shall employ a public accountant to audit the accounts of the Treasurer and Secretary and other agents of the Society and present a statement of the same in its annual report to the House of Delegates. The Chairman of the Board of Trustees shall make a report to the House of Delegates of its transactions for the year and of the amount of money belonging to the Society under its control
- Sec. 4 Three members of the Board of Trustees shall constitute a quorum

- Sec 5 The following shall be the order of business at meetings of the Board of Trustees
 - 1 Calling the meeting to order
 - 2 Roll call by the Secretary
 - 3 Reading of minutes
 - 4 Communications.
 - 5 Reports
 - 6 Unfinished business
 - 7 New business

CHAPTER VII

Duties of Officers

- Sec 1 The President shall preside at all meetings of the Society, the Council and the Censors He shall be ex-officio member of the Board of Trustees and of all committees. He shall appoint all committees not otherwise provided for He shall deliver an address at the annual meeting of the Society. He shall perform such other duties as the House of Delegates or the Council shall require
- Sec. 2 The ranking Vice-President in the absence of the President shall perform the duties of such officer. In the event of the President's death, resignation, removal, incapacity or refusal to act, the ranking Vice-President shall succeed him.
- Sec 3 The President-Elect shall perform no specific duties other than those of a member of the Council but shall attend the meetings of the Executive Committee without voice or vote
- Sec. 4 The speaker shall preside at all meetings of the House of Delegates He shall appoint all parliamentary committees serving during the meeting of the House of Delegates
- Sec 5 The Vice-Speaker shall perform the duties of the Speaker when requested by the Speaker to do so, or in case of the absence, death, resignation or refusal of the Speaker to act.
- Sec 6 The Secretary shall attend all meetings of the Society, the House of Delegates, the Council, Board of Trustees, the Executive Committee of the Council and the Censors, and shall keep minutes of their respective proceedings in separate records He shall be responsible for and have general charge of the Society's offices and the employees therein He shall be the custodian of the seal of the Society, and of all books of records and papers belonging to the Society, except such as properly belong to the Treasurer, and shall keep an account of and promptly turn over to the Treasurer all funds of the Society which come into his hands. He shall provide for the registration of the members at all sessions of the Society With the aid and cooperation of the secretaries of the county societies, he shall keep a proper register of all the regis-

tered physicians of the State by counties He shall aid the Councilors in the organization and improvement of the county societies and the extension of the power and influence of the Society He shall conduct the official correspondence, notifying members of meetings, officers of their election and committees of their appointment and duties He shall affix the seal of the Society to all credentials issued to members of the Society elected by the House of Delegates and to such other papers and documents as may require the same He shall make an annual report to the House of Delegates and also the reports of the Council and the Board of He shall supply each county society with the necessary blanks for making their annual reports to this Society Acting in coopera-tion with the Committee on Scientific Work he shall prepare and issue all programs amount of his salary shall be fixed by the Board He shall be ex-officio a member of Trustees of all standing committees He shall record the name and date of admission of each member of the Society

Sec 7 The Assistant Secretary shall aid the Secretary in the work of his office and in the absence or disability of the latter, he shall perform the duties of the office until the Secretary resumes the work, or in case of a vacancy until a successor shall be elected. He shall be entitled to all the rights and privileges of the office while acting as Secretary

The Treasurer shall keep accurate books of accounts of all moneys of the Society which he may receive, and shall disburse the same when duly authorized by the Board of Trustees, but all checks drawn by the Treasurer upon the funds of the Society shall be countersigned by the Secretary of the Society He shall collect, on or before the first day of June in each year, from the Treasurer of each component county society the State per capita He shall at the expense of the assessment Society give a bond for the faithful performance of his duties, which shall be approved by the Board of Trustees as to amount, form and Whenever requested, he shall make an annual report to the House of Delegates and to the Board of Trustees His salary shall be fixed by the Board of Trustees

Sec 9 The Assistant Treasurer shall aid the Treasurer in the work of his office, and in the absence or disability of the latter, he shall perform the duties of the office until the Treasurer resumes the work, or in case of a vacancy until a successor shall be elected. He shall be entitled to all the rights and privileges of the office while acting as Treasurer

Sec 10 Each District Councilor shall visit the counties of his district at least once a year and make a careful inquiry of the condition of the

profession in each county in his district and shall report thereon to the House of Delegates

CHAPTER VIII

Travelling Expenses

Sec. 1 Allowances for expenses incurred in the actual performance of official duties by officers, Councilors and Delegates to the American Medical Association shall be made in conformity with the following conditions

The President and the Secretary shall be allowed interstate railroad fares and a per diem for maintenance not to exceed fifteen dollars President-Elect shall be allowed travelling expenses when attending committee meetings members of the Board of Trustees, of the Council, and of the Executive Committee shall be allowed railroad fares to and from the places of meeting of these respective bodies. In all cases where no appropriation has been allowed a standing or special committee travelling expenses shall be allowed the individual members vouchers must be filed with the Secretary and approved by the Board of Trustees before any such allowance shall be made The Delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return The vouchers of such expense shall be approved by the Board of Trustees before payment Each District Branch shall be entitled to receive a sum of \$250 00, exclusive of the work done by the Secretary regarding notices, programs, etc., to defray the expenses of holding the annual meeting of such District Branch, provided a proper statement of such expense shall have been presented to the Secretary and approved by the Trustees All bills, claims or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense This time may be extended for any cause by the Board of Trustees and such extension shall not exceed ninety days

CHAPTER IX Censors

Sec 1 The Board of Censors shall have jurisdiction to hear and determine all appeals from decisions on discipline of component county medical societies or decisions of such societies which may involve the privileges, rights or standing of members whether in relation to one another or to county medical societies or to this Society. Any member of any component county medical society, feeling aggrieved by the decision of such Society may within three months after such decision appeal to the Board of Censors of this Society from the decision of such component

county medical society by filing a notice of appeal with the Secretary of this Society and the Secretary of the component county society

Sec. 2 Any applicant for membership in a component county medical society who may have been excluded from membership in such Society, may likewise appeal from the action of said Society excluding him. All decisions shall be subject to appeal to the House of Delegates

Sec. 3 The notice of appeal shall set forth in writing the name of the appellant, the name of such component county medical society and the date and substance of the decision appealed from, and shall indicate the ground or grounds upon which such appeal is taken

Sec. 4 Upon filing a notice of appeal, the appellant and the component county medical society shall submit to the Secretary of the Board of Censors all records, minutes, letters, papers and all written evidence including a digest of all testimony not stenographically reported relating to the matter. All data so submitted shall be confidential and privileged and shall be available only to the Censors and, on appeal, to the members of the House of Delegates

Sec. 5 The Board of Censors shall consider the appeal on the data so submitted to it, and may affirm by a majority vote, modify or reverse by a two-thirds vote of the Censors present and voting, the decisions so appealed from If, in its opinion, the taking of further evidence is advisable, the Board of Censors may summons witnesses and proceed to take such evidence in such manner as it may deem proper and render its decision by a two-thirds vote of those present and voting, which decision shall be binding until reversed or modified by the House of Delegates

Sec. 6 The Board of Censors shall investigate all charges preferred (a) by a member of a component county society against any component county medical society of which he is not a member, and (b) by a component county medical society against another such county society or a member thereof, and the Secretary of the Board of Censors shall submit the report to the House of Delegates for action thereon.

Sec. 7 A party desiring to appeal to the House of Delegates from the decision of the Board of Censors shall within three months after such decision, file with the Secretary of this Society and the Secretary of the component county society a notice of appeal Such notice of appeal shall set forth in writing the name of the appellant, the name of the component county society, the date and substance of the decision appealed from and the ground or grounds upon which such appeal is taken

Sec 8 Upon the filing of a notice of appeal the appellant and the Secretary of the Board of Censors shall submit to the House of Delegates the decision and all records, minutes, letters.

papers and all written evidence including a digest of all testimony not stenographically reported relating to the matter

Sec. 9 The House of Delegates shall consider and decide the appeal on the data submitted to it, and may affirm, modify or reverse the decision so appealed from Such decision of the House or Delegates shall be final and binding

CHAPTER X

Committees

Sec 1 The Committees shall be classified as Standing, Reference and Special Committees Standing and Special shall report to the Council and the House of Delegates

Committee on Scientific Work. Committee on Legislation

Committee on Public Health and Medical Education

Committee on Medical Economics Committee on Arrangements Committee on Public Relations Committee on Medical Research

Sec. 2 The Committee on Scientific Work shall consist of the Chairman, a member to be nominated by the President of the Society and elected by the Council, and the Chairmen of the different sections. It shall hold meetings and prepare the necessary programs for the annual meeting of the Society and for such other special meetings as may be designated by the House of Delegates. It shall forward programs in ample time for publication, and not later than thirty days before the annual session shall send a completed program to the Secretary for the printing of the final program

The Committee on Legislation shall consist of three members including the Chairman It shall be the representative of the Society on all matters of medical legislation and shall have charge of all hearings before the Committees of the Legislature The component county societies and their committees on legislation shall cooperate with this Committee and act in harmony with it on all such matters. It shall keep in touch with professional and public opinion on matters relating to medical legislation. It shall represent the Society in procuring the enactment of the medical laws of the State, in the interest of public health and of scientific medicine as will best sesure and promote the welfare of the whole people It shall take all legal and honorable means of opposing and preventing all vicious legislation detrimental to the best interests of the profession and the welfare of the public

Sec 4 The Committee on Public Health and Medical Education shall consist of nine members, including the Chairman It shall investigate, report upon and present to the Society such matters as may seem to the Committee to be of special

importance in their relation to the public health and Medical Education and in this work like committees of component county societies shall cooperate with this Committee

- Sec. 5 The Committee on Medical Economics shall consist of five members, including the Chairman It shall keep informed on all matters affecting the economic status of physicians and shall investigate and report on such matters as it deems necessary
- Sec 6 The Committee on Public Relations shall consist of five members, including the Chairman It shall be the function of this Committee to deliberate with other agencies, both official and unofficial, concerning the plans, purposes and objectives of their organizations insofar as they have a relation to the medical profession
- Sec 7 The Committee on Arrangements shall consist of nine members, including the Chairman It shall provide suitable accommodations for the meeting places of the Society, the House of Delegates and the Sections and shall make all necessary arrangements for these meetings. The Chairman of the Committee shall send an outline of the arrangements to the Secretary for publication in the program, and shall make such announcements during the session as occasion may require
- Sec 8 The Committee on Medical Research shall consist of ten members, including the Chairman. It shall adopt such measures as may be necessary to instruct the public and the profession in the desirability of animal experimentation and shall use all honorable means to oppose such bills as may be presented to the Legislature with the view of limiting or restricting scientific progress. It legislative work it shall act in cooperation with the Committee on Legislation.
- Sec 9 The Chairman of all standing committees shall be elected by the House of Delegates unless otherwise provided for in the By-Laws The remaining members shall be elected by the Council

Reference Committees

- Sec 10 Immediately after the organization of the House of Delegates the Speaker shall announce such committees as he shall deem expedient for the purposes of the meeting, and the names of the members thereof. Only members of the House of Delegates are eligible for appointment on the reference committees. Such committees shall consist of five members, three members constituting a quorum, and shall serve during the meeting at which they are appointed.
- Sec. 11 All recommendations, resolutions, measures and propositions presented to the House of Delegates and which have been duly seconded shall be referred immediately to the appropriate reference committee.

Sec 12 Each Reference Committee shall, as soon as possible, take up and consider such business as may have been referred to it and shall report when called upon to do so

Special Committees

Sec 13 Special Committees may be created by the House of Delegates to perform the special functions for which they are created. They shall be appointed by the officer presiding over the meeting at which the committee is authorized, if such committee is to conclude its work during said meeting of the House of Delegates. The President shall appoint all other Committees unless otherwise ordered by the House of Delegates.

Sec 14 A Special Committee on Prize Essays consisting of three members, including the Chairman, shall be appointed by the President Its duty shall be to receive all essays offered in competition for prizes which may be offered by this Society. The Committee shall make all necessary rules and regulations for the award of prizes subject to the terms of the deeds of grit, and shall report the result at the next annual meeting of the House of Delegates. They shall give notice through the Society's publication or by other methods within thirty days after their appointment, of the amount of the prize and when the essays shall be submitted to the Committee.

Sec 15 Any member of the Society shall be eligible to serve on Standing or Special Committees All members of committees, who are not members of the House of Delegates, shall have the right to present their reports in person to the House of Delegates and to participate in the debate thereon, but shall not have the right to vote.

CHAPTER XI

Meetings

Sec. 1 The notices of the annual, regular and special meetings of the Medical Society of the State of New York, its House of Delegates, Council, Board of Trustees and Censors shall state the date, place and hour and shall be mailed in securely post-paid wrapper to each member of the body holding such meeting at least seven days before said meeting. The Affidavit of mailing by the Secretary of the Society to the last recorded address of the member shall be deemed sufficient proof of the service upon each and every member for any and all purposes

Sec 2 Each member in attendance at the annual meeting, special or intermediate stated meetings of the Society, shall enter his name and the name of the component county medical society to which he belongs in a register to be kept by the Secretary of the Society for that purpose No member shall take part in any of the proceedings of such a meeting until he shall have complied therewith

- Sec 3 All'members in good standing so registered may attend and participate in the proceedings and discussions of the general meetings of the Society and of the sections
- Sec 4 The following shall be the order of business at all general meetings of the Society
- 1 Calling the Society to order
- 2 Address of welcome by the Chairman of the Committee on Arrangements
- 3 Reading the minutes of the last meeting
- 4 President's address
- 5 Special addresses
- 6 Reading and discussion of papers
- 7 Miscellaneous business
- Sec 5 Special meetings of the Society shall be called by the President upon-the request, in writing, of one hundred members, and in case of the failure, mability or refusal of the President to act, such meeting may be called by a notice thereof subscribed by one hundred members
- Sec 6 Special meetings of the House of Delegates shall be called by the Speaker upon the request, in writing, of fifty delegates, and in case of the failure, inability or refusal of the Speaker to act, such meetings may be called by a notice thereof subscribed by fifty delegates

CHAPTER XII

Sections

- Sec. 1 The Scientific Sections designated by the House of Delegates shall each organize by the election of a Chairman and Secretary The Chairman shall be elected annually, the Secretary for such term as the section may deem fit
- Sec. 2 The Chairman of the various Sections shall be members of the Committee on Scientific Work
- Sec 3 The election of officers of Sections shall be the first order of business of the afternoon session of the second day of each annual meeting. To participate in the election of any Section, a member must be registered with such Section and must have recorded his name and address in the Section registry.
- Sec 4 Each Section shall hold its meetings at such times as designated by the Committee on Scientific Work

CHAPTER XIII

District Branches

- Sec 1 Each District Branch shall elect a President for two years, who shall be the Councilor for that Branch
- Sec 2 Each District Branch shall elect such officers as are provided for in its By-Laws, who shall attend the business meetings of the Branch

CHAPTER XIV

Component County Societies

- Sec 1 Whenever an active member in good standing in any component county medical society removes to another county in this State, his name, upon his request, shall be transferred to the roster of the component county medical society of the county to which he removes, without cost to him, provided that he files a certificate with the Secretary signed by the President and Secretary of the component society from which he removed as to his good standing in such soci-No member, however, shall be an active member of more than one component county society, nor shall any component county society accept a physician residing in another county in any other way than in accordance with the law governing transfers
- Sec 2 If there should be an insufficient number of physicians and surgeons in any of the counties of this State to form themselves into a component county medical society, such physicians may become members of the component county medical society of an adjoining county when eligible by the Constitution and By-Laws of such county society
- Sec 3 At its annual meeting each component county medical society shall elect a delegate or delegates to represent it in the House of Delegates of this Society in accordance with the Constitution and By-Laws of this Society
- Sec 4 The Secretary of each component county medical society shall keep a roster of its members and of all other registered physicians of such county in which shall appear the full name of each of said ohysicians, the date of his admission to such society, his residence and the date when his license to practice medicine in this State was granted. He shall note any changes in said roster by reason of removal, death, revocation of license or other disqualification.
- Sec 5 He shall forward said roster and information, together with the names and places of residence of each of the officers of said society, the names and residences of each delegate of the House of Delegates of said society to the Secretary of this Society thirty days before the date of its annual meeting
- Sec 6 The Treasurer of each component county medical society shall forward to the Treasurer of this Society the amount of the State per capita assessment on or before the first day of June of each year
- Sec 7 Each component county medical society may adopt a Constitution and By-Laws for the regulation of its affairs and may amend the same provided they shall be first approved by the Council before becoming effective. The Constitution and By-Laws of component county societies must not be in conflict with the Constitution and By-Laws of this Society.

CHAPTER XV

Miscellaneous

Sec 1 No address or paper before the Society, except those of the President and orators, shall occupy more than twenty minutes in its delivery, and no member shall speak upon any question before the House of Delegates for longer than five minutes nor more than once on any subject, except by the consent of a majority vote

Sec 2 All papers read before the Society by its members shall become the property of the Society Permission may be given, however, by the Council, House of Delegates or the Executive Committee to publish such paper in advance of its appearance in the New York State Journal of Medicine

Sec 3 Any distinguished physician of a foreign country or a physician not a resident of this State, who is a member of his own State Association, may become a guest during any annual session upon the invitation of the President or officers of the Society, and may be accorded the privilege of participating in all the scientific work of the session

Sec 4 The rules, contained in Robert's Rules of Order, shall govern the Society and the House of Delegates in all cases in which they are not inconsistent or in conflict with the Constitution and By-Laws of the Society or the standing or special rules of the House of Delegates

Sec 5 Officers, members of Standing and Special Committees of the Society, may be removed from office or otherwise disciplined for malfeasance or nonfeasance in office, upon written charges made by any member and transmitted to the President The President shall order a trial upon said charges by the Council or a Committee thereof and in the event of such trial, the accused shall be given at least ten days' notice of such charges and have full opportunity to de-

fend the same, but no such officer or member of the committee shall be removed or otherwise disciplined except by a two-thirds vote of the Council In case any such officer or member of the committee shall be removed, he may appeal from the decision of the said Council to the House of Delegates, but pending the determination of such appeal, he shall not exercise the functions of his office

Sec 6 Sections of the By-Laws which refer to the order of business and to reference committees may be suspended by a two-thirds' vote of the House of Delegates

CHAPTER XVI

Sec 1 The seal of the Society shall be as follows

CHAPTER XVII

Amendments

Sec 1 Amendments to these By-Laws, except such as are obligatory by law, shall be made only at an annual meeting of the House of Delegates

Sec 2 Notice of the proposed amendment shall be given at a previous annual meeting of the House of Delegates, and before the same can be acted upon, it shall be published once before the annual meeting in the official bulletin or journal of the Society

Sec 3 The affirmative vote of two-thirds of the delegates present and voting shall be necessary for adoption

Sec 4 Amendments made necessary by law shall be made either by the Council or House of Delegates whenever such necessity exists

REPORT OF THE COUNCILLOR OF THE FIRST DISTRICT BRANCH

To the House of Delegates— Gentlemen

The Executive Committee of the First District Branch of the Medical Society of the State of New York and the Presidents of the different County Societies comprising this Branch, at the invitation of the President, attended a dinner at the Cornell Club, June 7, 1927, and discussed plans for carrying on the work for the current year. It was decided to attempt to bring before the members the real functions of the Branch organization. This it seemed, would be best carried on by bringing the meeting to a place which never before had been host to this Branch of State

Society, and with the object of inducing more new members in this section to affiliate themselves with the work of this Branch, Bronx County was selected as the place of meeting, October 20, 1927, was chosen as the date and it was decided to have three medical papers read at this meeting, devoting the rest of the time to Branch and State Medical Society Activities

As per schedule on October 20, 1927, at the Hotel Concourse Plaza, Bronx County, there were two sessions Morning session, beginning at ten o'clock, and afternoon session, at two o'clock Speakers at the morning session were

Dr James E Sadlier, of Poughkeepsie, President of the Medical Society of the State of New York, spoke on the Relation of the District Branch Societies to the State Society with remarks on the activity of the State Society

Dr W Warren Britt, of Tonawanda, Chairman, Committee on Medical Economics of the State Society, spoke on the activities of his committee with special reference to the Workmen's Compensation Law

Dr Thomas P Farmer, of Syracuse, Chairman, Committee on Public Health of the State Society had accepted an invitation to attend, but was prevented from speaking at the meeting, by illness

Dr Harry R Trick, of Buffalo, President-Elect of the Medical Society of the State of New York, Dr Daniel S Dougherty, New York, Secretary of the Medical Society of the State of New York and Dr Nathan B Van Etten, Bronx, Trustee of the Medical Society of the State of New York discussed the affairs of the Society in general

The Society declared a recess for lunch at this time and approximately two hundred in number sat down to luncheon in the hotel

The afternoon session commenced at two o'clock and was opened with an address by

Hon James A Hamilton, State Industrial Commissioner, whose subject was "The Workmen's Compensation Law, in regard to its relation with the Physician"

Dr Russell L Cecil, Assistant Professor of

Medicine, Cornell University Medical School, read the next paper on "New Factors in Etiology of Chronic Arthritis"

Dr William P Healy, Directory of Gynecological Service at the General Memorial Hospital, New York, read a paper on the "Indications for Radium Therapy in Intra-uterine conditions"

Dr John DeJ Pemberton, of Mayo, Clinic, Rochester, Minnesota, read the last paper, his subject being, "Some factors in the Mortality Statistics of Exopthalmic Goitre"

The attendance at the meeting was very gratifying and larger than any previous meeting of our Society. The attendance being somewhat transient, due to doctors in the vicinity being called away, or due to the fact that some had time to stay for but one or two papers, made it impossible for us to tabulate the exact attendance. However, at one time we had as many as five hundred in the hall. We regretted very much the length of the program prevented general discussion on the papers.

The President of this Branch has been in close, touch with the component County Societies and can report them in very flourishing and healthy condition. He has personally visited most of the Societies and will visit the remaining societies, before the end of the current year.

Respectfully submitted,

EDWARD R CUNNIFFE, President

April 15, 1928

REPORT OF THE COUNCILLOR OF THE SECOND DISTRICT BRANCH

To the House of Delegates—Gentlemen

The District Branches being the organized units which formally connect the individual county medical societies with the State Medical Society, the annual report of the councillor of a District Branch may properly include an account of the activities of the component County Societies. In the case of the Second District Branch the activities of the county societies are becoming more and more concerned with the social aspects of medical practice. This gradual change is well illustrated by the programs of the meetings of the last few years. These programs have given ever increasing space to the problems of public health and civic medicine.

The whole program of the annual meeting of the Second District Branch held in November, 1927, was designated "Civil Medicine on Long Island" It was planned to set forth

what had already been accomplished in the district along the lines of civic medicine and what was proposed for the future. In addition it was expected that the Branch might profit by the experience of other branches as interpreted by the president of the State Medical Society and by the president of a neighboring county society that had been having difficulties with lay welfare organizations.

The reports from the representatives of the four component societies showed that organized medicine on Long Island is not only participating in the health activities of the district, but is assuming leadership in the lay organizations dealing with the problems of civic medicine. In all of the counties the Tuberculosis and Public Health Associations work under the direction of the doctors or in close cooperation with committees of the county societies. The Public Health Committee of the large and flourishing Long Island Chamber of Commerce is composed of two members from each of the

county societies, and some civic minded doctors are upon the Chamber's board of directors. In Suffolk County there is not a single organized lay health effort that is not "dominated both in program and in administration by medical men, and none not directed by the

County Medical Society"

In the domain of graduate medical education the Friday afternoon lectures, begun in Brooklyn (Kings County) six years ago, are being continued. The audiences continue large and interest keeps at a high pitch. Similar lectures have been inaugurated in Queens and in Nassau Counties. These have also been well attended. Graduate clinical courses are being continued in Brooklyn, Queens and Nassau. In Suffolk County graduate education has been centered in the staff meetings of the four general hospitals of the county.

All of the counties are increasing very rapidly in population This increase is producing the greatest change in living conditions and in the problems of civic medicine in the two counties outside of Greater New York Nassau County has doubled its population in the last five years and is rapidly passing from a suburban to an urban community Similarly Suffolk County is changing from rural to suburban These two counties have continued their hospital investigations Their committees have studied the hospital needs of their communities and have published their reports, which are being heeded in the establishment of new The Suffolk County Committee has studied hospital management and has done much by a critical review and analysis of hospital work to advance staff organization and to raise the standards of hospital practice society is also attempting to make the county hospitals teaching centers, which will continually give a post graduate course in medicine to the members of their staffs, as well as places from which will radiate the forces that improve medical practice in the community

Both Nassau and Suffolk Counties have voted to promote a county health department, and Suffolk County is making the establishment of such a unit a main objective for the

coming year

The question of a permanent home for the county society is claiming attention in Kings, Queens and Nassau counties—Kings County has long had such a home, but the growth of its library, the increase in its membership and the multiplication of its activities have necessitated a movement toward a new and larger building—Queens County is already engaged in the construction of its medical home—In Nassau County plans for a medical society building have not taken definite form, but they are being discussed and will no doubt soon be decided

All four of the component county societies publish periodic bulletins which contain timely items of interest to the members. In Suffolk County an attempt is made to have the "News Letter" of the county society act as a clearing house for all the organizations doing public health or welfare work in the county. Twelve hundred copies are sold to the county. Tuberculosis and Public Health Association and distributed to interested persons throughout the county.

The foregoing are only a few of the many activities of the component societies of the Second District Branch, but they seem to be the most significant and the most far reaching in their effects They exemplify the principle for which organized medicine on Long Island has contended for many years, that medical leadership is essential to the full realization of the aims of civic medicine We believe that "the development of public health and the practice of the prevention of disease is a doctor's game" Only doctors have the ability through training to decide as between theoretical and practical The funcactivities in civic health matters tion of the lay health and welfare organizations is to carry out the details of the treatment after the medical expert has made the diagnosis and prescribed the remedy It is for these reasons that the Second District Branch and its component societies are giving increasing attention in the programs of their meetings to the problems of civic medicine

GUY H TURRELL, President

April 15, 1928

REPORT OF THE COUNCILLOR OF THE THIRD DISTRICT BRANCH

To the House of Delegates—Gentlemen

The past year has been one of a quiet steady growth for the Third District Branch

The Annual Meeting was held at Troy, October 1, 1927 The Branch was the guest of the Rensselaer County Medical Society The morning was devoted to clinics at the various Troy hos-

pitals, and after luncheon at the Hendrick Hudson Hotel, the scientific session was held. The meeting was honored by the presence of the President and Secretary of the State Society and also Dr. Card of Poughkeepsie and the Executive Officer of the State Society, Dr. Joseph S. Lawrence

This is the first time the Branch meeting has been held in Troy for quite a number of years and

judging from the enthusiasm displayed, the meeting was of great benefit to the Branch and to the Rensselaer County Medical Society—Great praise is due to Dr. Hambrook and his able committee for the smoothness in which the arrangements for the meeting were conducted

Four meetings of the Executive Committee have been held and various matters of importance

to the Branch have been taken up

The Branch is planning to assist the Albany County Medical Society as host for the Annual

Meeting of the State Society when it meets in Albany in May

All component County Societies of the Branch are in a prosperous condition and are displaying more interest in their work than in many years. The attendance at the Annual Meeting was about one hundred

Respectfully submitted, EDGAR A VANDER VEER, President April 15, 1928

REPORT OF THE COUNCILLOR OF THE FOURTH DISTRICT BRANCH

To the House of Delegates— Gentlemen

In order to comply with Section 44 of the By-Laws of the State Society requiring each District Councillor to visit each County Society once a year, your Councillor of the Fourth District Branch has been handicapped by reason of the fact that this District Branch covers at least onefourth of the area of the State and of the various Societies comprising this District approximately fifty per cent have their meetings on the same date Six of the ten County Societies hold two meetings a year St Lawrence County has six meetings, Fulton County ten, Schenectady County nine and Montgomery County has four average attendance at the County Society meeting has been uniformly good taking into consideration the distance that many of the members have to travel in order to attend the meeting The programs at all of the various County Society Meetings have been uniformly of an excellent character

The Fourth District Branch now has five hundred and thirteen members in good standing During the past year twenty-two new members have joined the various County Societies teen have either died or removed from this District. We find that there are sixty-one physicians at the present time who are known not to be affiliated with any County Societies in the Dis-Montgomery and Washington Counties are the only Counties in the District in which there are no physicians who are not at present active members of either Society In St Lawrence and Saratoga Counties the exact number who are not members is not known. In Schenectady County there are twenty-three Fssex County fourteen and Clinton County sixteen who are not at the present time associated with any County Society

An effort was made to ascertain what had been accomplished by the various Committees in each County Society Montgomery County reported much success I rulton County's Legislative Committee has done excellent work. Schenectady County reported nothing outstanding.

ington County reports that all Committees have been active Warren County reports the usual routine business St Lawrence, Essex, Saratoga, Franklin and Clinton Counties report nothing In practically all Counties anti-toxin has been uniformly administered in association with the Health Department

In five Counties no post-graduate lectures of any form have been delivered during the past year Clinton County had a course of lectures on cardio-nephritis Montgomery County had eight lectures on obstetrics Fulton County had a course of lectures on pediatrics St Lawrence had six miscellaneous lectures Saratoga County

had lectures on diseases of the lungs

The Annual Meeting was held at the Ellis Hospital in Schenectady on the afternoon of October 11th and the forenoon of October 12th The afternoon session was devoted to clinical demonstrations by members of the Schenectady County Society The morning session consisted of scientific papers on different topics. There were present taking part in the clinical demonstration Dr. P. D. Wilson of Boston and Dr. A. Goldbloom of Montreal. Dr. I. S. Wile of New York participated in the scientific program in the morning session. The Schenectady County Society tendered a banquet in the evening at the Golf Club.

Addresses in the evening were given by Dr James E Sadher, President, and Dr Daniel S Dougherty, Secretary of the State Society Following the addresses a remarkable demonstration of Making Sound Visible and Light Audible was given by Mr Taylor of the General Electric Company. The attendance at the Annual Meeting consisted of one hundred and twenty members of the District Branch and ten visiting physicians from outside the District. This attendance as far as can be ascertained, was the largest in the history of this District Branch. Greater interest was manifested in the clinical demonstration than in the scientific program and evidently had much to do with the unusually large attendance.

Respectfully submitted,

April 15, 1928 Lyman G Barton,
President

REPORT OF THE FIFTH DISTRICT BRANCH

To the House of Delegates—Gentlemen

As President of the Fifth District Branch of the Medical Society of the State of New York,

I herewith submit my annual report

The Executive Committee of the Fifth District Branch met in Hotel Syracuse on Thursday evening, June 2, 1927 The meeting began with a dinner The following were present Dr Charles Post, President, Dr Page E Thornhill, 1st Vice-President, Dr A. B Santry, 2nd Vice-President, Dr W J McNerney, Secretary, Dr E L Finley, President of Madison County Society, Dr J. D Olin, President of Jefferson County Society; Dr E R Evans, President of Oneida County Society, Dr T P Farmer and Dr J. S. Lawrence

It was decided to hold the next annual meeting in Syracuse on Thursday, October 13th, and the Onondaga County Society will be the host. The character of program was discussed and while only a few names were mentioned as prospective persons to be invited to read papers, a list of subjects that would be most interesting was prepared

There followed considerable discussion of the manner of conducting the courses in post-graduate instruction, in which Dr Farmer took an active part with representatives of the counties where courses have been held. There was also considerable discussion of the function of a Public Relations Committee, and the need for such committee was strongly emphasized by those present who are presidents of county societies.

The program of the annual meeting held in Syracuse October 13, 1927, followed as closely as possible the plan outlined. The meeting was unusually well attended. A complete report of this meeting has already appeared in the Journal

The societies of the Fifth District differ widely in their activities and character of organization

HERKIMER COUNTY

During the year this society has endeavored to establish a County Laboratory but was not successful due to the fact that it did not have the support of all of the profession in the County. Four meetings were held at which papers were read and cases reported by members of the Society In the fall a series of four well attended lectures were given on Cardiology, furnished by the State Society Assistance has been given the State Society in suppressing quacks and illegal practitioners in the County

JEFFERSON COUNTY

This County has carried out an unusually varied and intensive scientific program. Speakers of note have been secured from New York, Syracuse and elsewhere. In addition a post-graduate course was given by the State Society on Gastro-

Intestinal Diseases The address of the retiring President, Dr J D Olin, dealt with Ethics and the need of cooperation of the doctors for the best interests of the patients. At one meeting eleven patients with Interstitial Keratitis and other signs of Congenital Syphilis were shown. A symposium on Congenital Syphilis conducted by local men followed. Additional meetings have been held where the program was in charge of local men. A Public Relations Committee has been appointed and has found much to do

Through joint action of the County Society with a Committee from Mercy Hospital the Board of Supervisors were induced to provide a County Hospital for Contagious Diseases

The Board of Censors has been active in correcting violation of the Medical Practice Act. They have made rigid professional standards a qualification for membership. The society is in a flourishing condition. The meetings during the past year have been the best attended in years.

ONEIDA COUNTY

Early in the year the Oneida County Medical Society cooperated with the County Board of Supervisors in making plans for a County Tuber-These plans are now in the culosis Hospital During the year the process of materializing toxin-antitoxin campaign was pushed strenuously, the result being a tremendous drop in the figures of diphtheria The County Society through its milk campaign has been particularly active in the supervision of milk supply and distribution throughout the county Post-graduate courses and studies in Obstetrics and in Pediatrics extending over thirteen lectures were received with enthusiasm and attended by an average of fifty Programs for the meetings have been largely outside speakers and the attendance at the meetings approximately 50 per cent of the membership

Onondaga County

This County has four meetings annually, two of which are held at country clubs where golf is enjoyed. The attendance as formerly has been good. The meetings are addressed by some speaker of prominence outside the County. A post-graduate course is planned for next fall of sufficient character and scope to attract men from surrounding counties. Public Health matters are being given careful consideration. The Legislative Committee is alert and has done valuable work. The Milk Committee fulfills a very important function in checking up on the milk supply of the County.

The President senses the importance of Council meetings and has been present at all meetings

of the Council during the past year

Respectfully submitted,

April 15, 1928

CHARLES POST, President

REPORT OF THE COUNCILLOR OF THE SIXTH DISTRICT BRANCH

To the House of Delegates— Gentlemen

The Annual Meeting of the Sixth District Branch for 1927 may, I think, be justly described as the largest in attendance and the most enthusiastic in interest in its history. The attendance was about 200 and the majority were present at adjournment.

It is said that comparisons are odious Even so I hope I may be pardoned in this case by reason of what I feel to be a justifiable pride in the Sixth District Branch, if I quote the attendance as reported at the Annual Meeting of the following District Branches

Third, which includes Albany and Troy, 84 Fourth, which includes Schenectady and Amsterdam, 130

Fifth, with Syracuse and Utica and excluding students of the Syracuse Medical College, 210

Eighth, with Buffalo and Niagara Falls, 120 For a full report of the program presented at the Annual Meeting of the Sixth District Branch, I refer you to the State Medical Journal of October 15, 1927

Several preliminary notices were sent to nonmembers in the District in the hope of increasing the membership Quite a number of such were recorded in attendance, but I regret to say that very few ultimately became members

All the County Medical Societies in the District have been active in public health work, such as securing representation on County Public Health Committees, in clinics of various kinds, T B and T A work, etc, and nearly all if not quite all, have had one or more post-graduate courses, and other such courses are arranged for the future

It would seem that the rural county societies are alive to, and taking advantage of, the opportunities for post-graduate work and awakening to the necessities of becoming increasingly active in public health work

Respectfully submitted,
Wilber G Fish, President
April 15, 1928

REPORT OF THE COUNCILLOR OF THE SEVENTH DISTRICT BRANCH

To the House of Delegates—Gentlemen

Our annual meeting was held September 29, 1927, at the Geneva Country Club The attendance was the largest in the history of our Branch meetings and the Club House was found to be too small to accommodate comfortably the number in attendance The program was enthusiastically received, special interest centering in our guests' parts in the program The papers of Dr John B Deaver, Dr Foster Kennedy and Dr Ward Crampton were most interesting and instructive

The election of officers was as follows President, Dr Austin G Morris of Rochester, First Vice-President, Dr Ralph M Sheldon, Lyons, Second Vice-President, Dr M Louise Hurrell, Rochester, Secretary, Dr John Lichty, Clifton Springs, Treasurer, Dr Edward Wentworth, Rochester

The component county societies throughout the District are active and flourishing. The meetings are well attended. There is an increased interest in Public Health affairs and the County Societies are gradually assuming leadership in these matters. There has been much interest and participation in the toxinanti-toxin programs. Even in the smaller communities numerous clinics have been held and hundreds of children protected from diphtheria.

Seneca County Society claims to be the first county to examine the children of pre-school age under the Shepard-Towner Act, by physicians appointed by the Society from its members

The percentage of active physicians in this District, not members of the County Society, is very small. Approximately only 5 per cent are non-members. In Yates County only 2 per cent are not members. In Seneca County there are only two active physicians practicing outside of institutions, who are not members.

On the whole the status of the County Societies is most wholesome and satisfactory

Respectfully submitted,

C. C. LYTLE, President.

April 15, 1928

REPORT OF THE COUNCILLOR OF THE EIGHTH DISTRICT BRANCH

To the House of Delegates— Gentlemen

The Annual Meeting was held at Warsaw and proved to be the most successful in several years. There were in attendance, almost three times as many members as we had in Buffalo at the preceding Annual Meeting. This was due to three factors, namely, an excellent program, ideal weather and the fact that the meeting was held in a picturesque country town. The attendance when our meetings have been held in rural communities has always been better than when a large city such as Buffalo has been chosen as the meeting place.

Aside from the Annual Meeting, the activities of the society have been practically nil. The only useful function of a district branch society is that of coordinating and stimulating activities of the component county societies. This can be done efficiently only through meetings of the Executive Committee composed of the officers of the County Societies. Such meetings were held in 1926 and found to be extremely helpful. In 1927 they were discontinued and as a result there was no coordination and no activity shared by all of the component county societies. It is possible that meetings of the Executive Committee might have

resulted, for example, in uniformity of action in

regard to legislation. The Chautauqua County Society endorsed the amendment properly known as the Birth Control Act. This amendment merely stated that reputable physicians were not guilty of immoral conduct when they gave proper advice to their patients concerning contraception. The Eric County Society on the other hand, opposed this amendment thereby indicating that it preferred to have its members remain legally immoral.

The Cattaraugus County Medical Society has been actively opposing the work of the Milbank Fund and the attitude of the society has been endorsed by the Genesee County and Erie County Societies This unfortunate situation might well have been studied by the District Branch Society through its Executive Committee had this body been functioning Each year it becomes more evident that funds should be made available for at least two meetings of the Executive Commit-Unless this is done, the branch society is little better than a skeleton organization, which comes to life once a year at its Annual Meeting It is a debatable question whether this one meeting a year is sufficient justification for the existence of the Society

THE ANNUAL REPORTS

The activities of the Medical Society of the State of New York have become so extensive that the annual reports of the officers and committees are of unusual length, but their value is equally comprehensive

To serve the society as an officer or committeeman is much more than an honor-it requires much time and hard work This fact will be evident to anyone who reads the reports, which fill the first 48 pages of this issue of the JOURNAL.

THE MEDICAL POINT OF VIEW

Medical service to the people involves two branches of practice

- 1 Scientific Medicine, by physicians
- 2 Administrative activities, largely by a non-medical personnel

The practice of medicine in hospitals requires not only purely medical services, but also administrative work, such as that in the departments of purchasing, the kitchen, the laundry, and nursing. The peculiarity of the administrative service is that it is strictly subordinate to the needs of medical service.

The practice of public health also involves the two forms of medical practice

- I That of scientific medicine, which is the field of physicians only
- 2 That of administration, which is largely in the hands of laymen, especially voluntary health organizations

The relation of the physicians to the lay organizations is in a state of evolution. The activities of the two groups often overlap, and their boundaries are not yet clearly defined and accepted. The practice of public health has heretofore been dominated by the administrative or non-medical group, whose members, seeing the progress in medical science, have worked with two objects in view.

- 1 Creation of a demand for preventive medi-
- 2 Provision for the supply of that medical service

The zeal of lay administrators has sometimes outrun the serious judgment of practicing physicians. The administrators have assumed that medical practitioners could supply the demand if they would. The optimism of the laymen has led, for example, to premature predictions, such as "No uncared for tuberculosis in 1925," and "No tuberculosis in 1930."

The medical point, of view differs in some respects from that of the lay health workers, particularly in regard to extreme optimism regarding immediate results from public health Physicians who deal with all classes of people acquire a tolerant attitude toward their whims and fancies, and they expect people to follow their emotions quite as much as their Physicians have seen many new schemes of public health rise and fall, and they are not likely to be enthusiastic over any They know that the people will follow a line of reasoning so long as it is logical, regardless of the scientific foundation on which They know that the people will follow the cultists and quacks quite as readily as their scientific leaders There is a comforting psychology in a positive promise, which physicians are often too conscientious to give The

point of view of the physician is first of all to speak the truth

The employees of lay organizations engaged in the practice of public health, frequently make a distinction between the practice of hygiene and the practice of medicine, claiming that giving hygienic advice does not constitute the practice of medicine. The medical point of view is that giving hygienic advice is a form of the practice of medicine, for it involves both diagnosis and treatment

Physicians believe that the practice of preventive medicine is simply an extension of the practice of clinical or curative medicine along two lines

- 1 Early diagnosis or pushing back the time of the recognition of disease to its early stage, or even the stage of impending threat
- 2 More efficient therapeutics in order to avert impending sickness

The practice of preventive medicine consists of the ordinary methods of ordinary practice applied to sickness in its early stages. No new system or personnel can be introduced without friction and duplication of effort. The physicians of a community are able and willing to supply all the medical service that the people need. They hold the view that hygienic advice shades insensibly into the more evident practice of medicine or even surgery. There can be no distinction between the practice of hygienic medicine and that of curative treatments.

Physicians hold the point of view that medicine is a personal matter, while lay administrators emphasize the statistical side of medical practice The administrators look upon cases of sickness as a group in which a certain pro-Their reports portion of cures are effected show a high proportion of cures, but the physicians know that a large proportion of cases requiring public health treatments do not re-In fact, the proportion of efficient results in preventive medicine are about the same The most optias those in curative practice mistic advocate of public health will be compelled to admit that at least 20 percent of their cases are incurable from a scientific point of view, and that at least another 20 percent will fail to follow treatment, either wilfully or from inability to carry it out. This leaves 60 percent of the cases in which efficient results The administrators give may be expected wide publicity to the 60 percent of cures, while the physicians are compelled to give serious consideration to the 40 percent of failures which remain on their hands, after having chased the golden pot of health at the end of the rainbow of rosy promises

The medical administrators depend on publicity and education for their support physicians have avoided undue publicity in the past, they now hold the point of view that publicity and education of the public is a necessary part of practice of medicine However, physicians deprecate propaganda as distinguished from education They are opposed to indiscriminate promises of cure, such, for example, as that all tuberculosis is curable, and that all forms of rheumatism are preventable result of such propaganda is that a patient who does not receive immediate relief is likely to think that his doctor is inefficient and to look for one who will give a more favorable prognosis Physicians wish to tell not merely the truth, but all the truth

Physicians have an attitude of open-mindedness. They are willing to discuss all problems which are connected with the practice of medicine. They are ready to "Put their feet under the table and to reach agreements." They are

willing to change their opinions in preventive medicine and public health, just as they are in the practice of curative medicine. They subscribe heartily to the definition given by Dr. Samuel Lambert that "Diagnosis is a working hypothesis for the application of therapeutics, subject to change without notice on the discovery of further evidence"

The open-mindedness of physicians is demonstrated by their willingness to consider the point of view of the lay administrators in friendly conference They are willing to support the lay administrators in their efforts to provide the means by which physicians may bring benefits of public health and preventive medicine to all people However, they reserve the right to judge whether or not the methods of the administrators are suitable for the promotion of these objects Physicians hold the point of view that the field of medical administration, as that of hospital administration, is subordinate to that of medical practice by physicians

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

The Practice of Civic Medicine Times change but human nature is always the same. Physicians a generation ago had the consciousness of the civic duties which belong to the members of their profession. The following editorial from this Journal for May, 1903, applies equally well to the physician today.

"We believe that nearly all, if not quite all, of the members of the medical profession in this State are anyious to do whatever lies within their power to relieve the sufferings of humanity, to preserve the health of our citizens and to advance their welfare and happiness

"The American who bewails the corrupt condition of our politics and yet fails to do his duty at the primaries, fails to shoulder his own share of responsibility for the condition of our politics, is certainly of small value to his country. His patriotism is at a low ebb

"The doctor who desires to see the best possible laws passed and enforced for the preservation of health, who desires to have upon our

health boards none but capable men, who desires to have better protection offered to the laity against fraudulent and irresponsible practicers and quacks, who desires to see his coworkers in this profession protected from those who would take tdvantage of their kindness of heart and sympathy, and seek through the courts to rob them of their characters and their money, and who desires to do his share in elevating the profession, and making its members more noble and better fitted for the work God has given them to do-that doctor will identify himself with the County, State and National organizations in all their proceedings, he will be proud and happy to do his share by filling the place in the membership roll to which he is entitled, by taking an active part when called upon so to do and by being ever ready to offer encouragement to those who are working for the organization-working for hım"

MEDICAL PROGRESS

Observations on the Significance of Low Arterial Pressures -On the basis of many cases, frequently observed, and often watched over a period of many years, in health and dishealth, A. Graham Stewart concludes that a persistent low blood pressure, provided it is not part of a grave syndrome-Addisonian, for exampledoes not itself tend to shorten life, and is not a Patients with persistent low blood dread state pressure are not bad operative risks, on the contrary, they appear to tolerate operations particularly well, and the operation does not tend to lower blood pressure still further Persons with low blood pressure are not generally the subjects of gross arterial degeneration On the other hand, marked arteriosclerosis may be accompanied by a very low pressure, thrombosis is then the danger The one symptom complained of by all persons with very low blood pressure is easy fatigue, yet many of them are capable of considerable physical exertion The vast majority of these patients have been toxemic, the source of the toxemia being intestinal The state often indicates a lowered general tone, due not to the low blood pressure but to the toxemia A persistent, inveterate, and progressive lowering of the blood pressure in tuberculosis, lobar pneumonia, cachectic states as in cancer, in the idiopathic anemias, and in chronic nephritis is a grave sign, and is almost invariably a herald of impending dissolution In young people very low pressure may be indicative of a pretuberculous state, and may be a useful diagnostic point In the normal or hypertonic patient in whom, after operation, the drop is gross and persistent, death will probably en-Treatment should be sue, due to motor paresis directed against the toxemia producing the low The most efficient drugs are generous doses of liquid paraffin, along with tincture of belladonna, 8 minims twice a day The correct diet should consist of dairy products, fresh fruit, vegetables and salads, with little meat the toxemia has been cleared up (usually in about three months) pituitrin is useful, but strychnine is generally the most satisfactory drug in this condition -Practitioner, February, 1928, cxx, 2

Alternation of the Pulse—Dr V Chini of the University of Padua seeks to show that electrocardiographic alternation is entirely dissociated from mechanical alternation. It has long been known that one type of arrhythmia, the pulsus alternans, receives no confirmation from electrocardiography which is dumb in this condition. In such cases the alternation is therefore termed mechanical. The author appends a series of cases in which the electrocardiographic finds were positive, although

the clinical evidences were not corroborative. Autopsies were obtained in all cases In one case the electrocardiogram showed alternation although there was no alternation of the pulse The patient died in a paroxysm of angina pectoris and autopsy showed aortitis and sclerous There was a remarkable degree mvocarditis of atresia of the coronaries In interpreting the electrocardiogram the author neglects to state his diagnosis, and this seems to have been the case in all of the histories, but as the article appeared in the Archives des maladies du coeur (February, 1928), a periodical for cardiac specialists, it is probable that the electrocardiograms are self-explanatory to technicians

Treatment of Fibroids -In discussing the indications for the various types of treatment of fibroids (Canadian Medical Association Journal, March, 1928, xvin, 3), B F Mobray states that symptomless fibroids do not require radical measures, except in the nervous patient who is made unhappy by the knowledge that she has a fibroid Neither irradiation nor surgery is devoid of danger As a rule no patient under 40 years of age should be subjected to irradiation, unless grave complications render In patients over 40 years of surgery unsafe age, whose nervous systems are stable, in cases in which hemorrhage is a prominent feature and in which tumors range in size from a small myomatous nodule to that of a three months pregnant uterus, provided the tumor is not pedunculated or degenerated, or rapidly growing, irradiation is indicated As to whether the a-rays or radium shall be employed depends on The use of the x-rays causes circumstances the patient less inconvenience and the cessation of bleeding is more prompt in properly selected cases, but there is danger that other organs may be influenced by the r-rays Radium in a capsule so heavily screened as to eliminate practically all of the gamma rays, and placed well up into the fundus of the uterus, where it is left long enough to deliver 600 to 900 milligram hours, is nearest the ideal The indications for surgery are, treatment broadly speaking, all patients under 40 years of age, those over 40 unsuited to irradiation, all submucous or pedunculated tumors, all cases in which there is adnexal disease, an inflammatory process, or any pathological uterine lesion other than fibroids, all tumors causing pain or pressure, all multinodular tumors filling the pelvis or lower abdomen, and all cases in which there is a reasonable doubt as to the nature of the tumor Myomectomy has a greater field

of usefulness than is usually credited to it, and should be considered in all patients under 40 years of age and certainly in all under 30 years. It is not advisable in the presence of severe anemia, in women past the menopause, nor in the presence of tubal inflammation and multiple fibroids. Hysterectomy (always total) is the operation of choice in patients over 40 years of age, with rapidly growing or degenerated fibroids, with a fetid uterine discharge, with signs of malignancy, or with concomitant uterine or adnexal disease. The ovaries should be conserved in every patient who has not reached the menopause

New Results of Research Into Urticaria and Its Treatment - Professor H T Schreus says that the relationship between the wheals of urticaria and the general condition associated with them is obscure. Often acidosis suffices as a rationale and in such cases alkalies and vegetarian diet are valuable. The author therefore has studied the disease from the angle of the acid-base equilibrium, although hitherto this line of research has thrown but little light on the nature of the dermatoses For some time the author has studies all his urticaria patients as to their alkaline reserves, and not only these but all related conditions as pruritus, Quincke edema, serum rash, eczema, and dermatitides of a pruriginous character The range between high and low values was at a maximum in pruritus and a minimum in the Quincke edema In only a part of the cases did urticaria per se show a dependence on the alkalı reserve The author sought to invoke the action of an artificial acidosis provoked by injection of certain acid-forming substances This was tested especially in cases which had benefited by alkaline treatment By this means he brought about a relapse of the urticaria The principal substance employed for this purpose was ammonium chloride. The latter was also tried out in cases in which the alkali reserve was unaffected although alkaline treatment was beneficial In this case which was of the giant urticaria type, the acid-forming substance induced an outbreak which was relieved once more by sodium bicarbonate. There are clearly two types of urticaria, in one of which alkalies are strictly indicated while acidformers of all kinds are out of place. In the other type sodium bicarbonate may be tested, but the probability is that calcium, strontium, and other proved remedies for urticaria will give the best results - Münchener medizinische Wochenschrift, February 24, 1928

Tetanus and Congelation —Dr Ceppi of Porrentruy, Switzerland, writes at some length on the relations between cold and tetanus. In all degrees of cold, comprising damp cold air, draughts, chilling, frost-bites, etc, the resis-

tance to the tetanus germ is believed to be lowered Old military surgeons laid stress on cold and in the late war tetanus often complicated trench foot The author has been a partisan of the prophylactic use of serum since 1896 and has seen but one case developed after For some reason the profesthe injections sion has never practised these injections after burns and freezes The author relates an unusual case in which, on account of the sudden supervention of malignant tetanus, an injection would probably have been of no avail patient was a chronic alcoholic, 71 years old Going from saloon to saloon on a winter day he had fallen in the snow and frozen his hands As he said nothing to any one, there was no knowledge as to how he had got out of his He had some sort of first aid predicament dressing on, and when the author was summoned, about three days after the exposure, he substituted for this a proper antiseptic Next day the patient was sent to dressing the hospital On the seventh day tetanus appeared and proved fatal on the very next day The rationale of this case is obscure for snow is clean in comparison with street dust and The case had of course no connection whatever with tetanus from exposure, the socalled rheumatic tetanus with no history of a wound often undergoing a slow recovery is curious that the ancients who had a very limited knowledge of tetanus gave weight to two factors involved in this case, namely exposure and alcoholic indulgence -Schweizerische medizimsche Wochenschrift, February 11, 1928

Progress in Our Knowledge of Rachitis -Karl Klinke of the Breslau Child Clinic sums up the recent advances in our knowledge of rickets as an avitaminosis—the action of ultraviolet light in giving vitamin effect to lipoid dietetic substances, the direct antirachitic effect of the rays on the skin, the discovery of ergosterin and the therapeutic use of the same, and the large amount of work which is being done on phosphate metabolism and calcifica-It has been shown that the first step in the latter is the deposit of calcium ions in the cartilage, this being followed by the combination with phosphoric or carbonic acid, and finally the chemical union of calcium with albu-Rickets is concerned with the first step only and there is an inhibition of lime formation while the blood contains too little phosphate, indicating diminished absorption existence of a special enzyme termed phosphatase has been shown Lime salts are not very soluble at best but in hypophosphatemia the phosphatase is not reduced in amount and apparently its fluctuations are not a factor in the disease causation Acidosis when present does not appear to be a prime factor more these components are studied the more

they appear as results and not as causal factors. At present we can only state that in its intimate nature rickets is dependent on the body cells and is due to some pathological alteration of the cell albumin. This it is which in all probability is acted upon favorably by the vitamin treatment. It has been shown often enough that rickets is a disease of the entire organism and that we must not visualize it as a mere bone disease, but most of the research of the past years has been directed toward the osseous system at the expense of the body at large — Klimische Wochenschrift, February 26, 1928

A Cardiac Hormone—It was once expected that a hormone might be extracted from the animal heart which could be utilized in prac-Such a principle should act upon the automatic activity of the cardiac muscle or In a brief note by R Rigler and F Tiemann attention is called to the fact that a supposed cardiac hormone discovered Haberlandt is not specific for the heart muscle, but is present in a number of organ extracts One of the authors (Rigler) has written several papers during the past year which show there are no grounds for the existence of a specific hormone for the heart Subsequent investigation has revealed that a substance may be extracted from the sinus tissue of the heart which can stimulate to contraction the uterus of the virginal guinea pig although it exerts no such action on rat uterus A number of other manifestations of the action of this extract are appended in each of which the action of the extract is identical with that of histamine Both the latter and the sinus extract appear to have their action strengthened by irradiation. In short, it seems certain that the cardiac hormone is none other than histamine -Klimsche Wochenschrift, March 18, 1928

Torsion of the Great Omentum A Note on Two Cases — These two cases occurred in rapid succession in the practice of Charles MacAuley In the first the diagnosis of acute appendicitis was made with confidence second case was thought to be one of appendicular abscess on account of a tender mass, although a little reflection might have suggested that the development of such a large mass was rather rapid for a case of appendi-In both cases the right portion of the omentum was involved In both cases the affected portion of the omentum was adherent to the anterior abdominal wall, which explains the parietal edema noted in both The presence of early edema, especially when followed by the exit of blood-stained peritoneal exudate, should render one alive to the posssibility of omental torsion in urgent abdominal opera-It is conceivable that the condition

might be overlooked when the abdomen is opened by a gridiron incision, especially if, as on one of the author's cases, the affected portion of the omentum was quite small and operation was carried out early in the attack—British Journal of Surgery, January, 1928, xv, 59

Severe Intestinal Reactions in Graves' Disease - Carlos B Udaondo, a gastrologist of Buenos Aires, mentions the case of a woman of 36 who sought treatment for a profuse sustained diarrhea Aside from her 5 or 6 daily fluid movements without pain, mucus, blood, etc, and a general nervous, excitable state which was getting more pronounced, there were no complaints, and the objective examination was largely negative although there was a pulse of 110 with other rather slight suggestions of hyperthyroidism The diagnosis was only that of suspected Graves' disease The patient was placed on the Moebius antithyroid serum with treatment directed toward the intestinal tract and she did well until an automobile accident caused a relapse This crisis passed off gradually, apparently not much hastened by treatment, but others followed from time to time and in the last one the diarrhea assumed a choleriform type with as high as 30 stools in 24 hours and a pulse of 130 The only treatment mentioned is opiates for the diarrhea, adrenaline and injections of glucose during the critical periods, with tonics in the intervals The outcome of the case is unknown, as the patient very imprudently went on a voyage to Europe Such cases are by no means rare and according to the experience of some clinicians diarrhea is present in about 30 per cent of these patients This may supervene early or late and may, as in the present case, be the chief and even the sole symptom The mechanism is unknown and may differ with the case In the above example the author associated it with absence of acid in the gastric juice, but this will not explain other cases In theory the action of the thyroid hormone on the vagus should explain the phenomenon-Journal de medecine de Lyon, February 5, 1928

Kohler's Disease—Leonard W Ely reports six cases of Kohler's disease, those of five boys and one girl, ranging in age from four to six and a half years (Archives of Surgery, February, 1928, xvi, 2) In three cases the right foot was affected, in two the left. In one case the symptoms were present on one foot only, but the Roentgen rays showed the appearance of the condition in both feet. In all but one case the roentgenogram was so characteristic that the diagnosis could be made without difficulty. There was correspondence between the clinical picture and the radiographic observations in all but one case. In this case

the clinical picture was that of a mild injury or infection, while the roentgenogram indicated great damage to the bone The finding of marked abnormality by the Roentgen rays in an apparently normal foot shows that the "disease" may exist without causing any symptoms or physical signs, as in the Osgood-Schlatter disease and Legg's disease, which certain writers have considered similar to The roentgenograms often Köhler's disease reveal greater or less abnormality in other bones of the feet In spite of great abnormality in structure, as shown by the roentgenograms, five of the patients recovered promptly with little or no treatment, while the remaining patient recovered after wearing a plaster bandage for about six months Radiographic examination after recovery shows that the apparently hopelessly damaged bone slowly develops and becomes normal in structure and shape. Ely concludes that Köhler's disease is a developmental anomaly of the tarsal navicular bone accompanied by symptoms which persist for a longer or shorter time and then disappear Patients should be treated symptomatically

How Tuberculosis Spreads in Virgin Communities -R. Arima and I Ishihara of Osaka have had the opportunity of following up the extension of tuberculosis in certain regions of Japan which had previously been immune to the disease Its behavior is strikingly like that of the acute infectious diseases in that it pursues an acute and foudroyant course Merely allergic manifestations such as pleurisy and cutaneous scrofulosis are hardly ever seen and this is also true of surgical tuberculosis and pulmonary hemorrhage In one village there was an epidemic outbreak of 26 cases, the ages of the patients varying from 3 months to 61 years although the majority were adolescents The duration of the disease varied from one month to more than two years True miliary tuberculosis is mentioned in but one case. In the great majority of cases there was localiza-tion in the lungs, but other regions often attacked were the peritoneum, intestines, and lymphnodes Tuberculous meningitis is mentioned but once None of the victims survived The blame for introduction of the plague was placed on an occasional wanderer who sought shelter from the inclemency of the winter weather, but that does not seem probable. since there must have been in such case a long period of latency-something like thirty years -before the outbreak of the epidemic The 26 victims came from a few families only and all

other families of the village have thus far remained uninfected Infection is assumed to have been from man to man by droplet transmission or indirectly from dried and dustborne Food transmission can be definitely excluded Judging by these Japanese epidemics much of our knowledge of tuberculosis will have to be revised, or rather tuberculosis in a virgin community will have to be recognized as something quite distinct from the same affection in a community which has for centuries been ravaged by the disease the latter we find many types of tuberculosis which owe their characters to partial acquired ımmunity-Deutsche medizinische Wochenschrift, January 27, 1928

Rationale of the Liver Diet in Pernicious Anemia, - Dr Paul Jungmann of Berlin beheves that the benefit derived from the Minot-Murphy diet in this disease is not casual but symptomatic in nature Further the action of liver in these cases is not specific, for the beneficial substance also occurs in kidney and in ordinary muscle His own experience with 15 cases was uniformly favorable, for after all of the customary procedures had failed to give relief, this was afforded by the liver diet in a few weeks, while discontinuance of the diet was in some of the patients followed by a return of the anemia Because the liver substance does not act in any way by removing the cause, our understanding of permicious anemia, so far from being simplified, is rendered much more complex and a number of new problems come up for solution ory that the disease originates in the intestine will probably receive a setback unless it can be shown that the remedy acts primarily on the intestine, for it has been noted that the state of the latter improves simultaneously with the anemia But the author inclines to the view that the theory of the enterogenic origin of the anemia is strengthened rather than weakened by this discovery. In regard to the action on the anemia the author believes that there is no new manufacture of red cells but rather a cessation in the destruction of the same. The blood in fact is not directly influenced by the diet which acts primarily on the reticulo-en-dothelial system, the metabolism of which is favorably modified Eventually a polycythemia develops The cured patient suggests one who has recovered from a severe toxicosis The research of the author was devoted very largely to blood study while the socalled digestive aciduria also received attention -Klinische Wochenschrift, March 4, 1928

COLLES' FRACTURE WITH SOME RESULTANT DEFORMITY

Here it was charged that on February 18th, the plaintiff's left arm was broken by reason of a fall, that after the injury, she went to the dispensary of the hospital, and was there referred to the defendant physician connected with said dispensary, that this physician undertook to attend and treat her, but that he did not use proper care and skill, and that by reason of his negligence and carelessness, the plaintiff's arm was improperly set and ineffective for use, and that the arm had to be rebroken and reset three times, that the defendant physician represented himself to be a capable and skillful physician, but negligently failed to reduce the fracture that the plaintiff had sustained, and was negligent in his treatment, so that the arm became diseased and suffened, and drawn out of shape, injured, crippled and scarred, that by reason of the defendant's acts, it became necessary for the plaintiff to obtain treatment from other physicians, to have X-rays taken, and to have the arm massaged, and that she was put to great expense for doctors' bills, nursing, massage and household help By this action, the plaintiff sought to be compensated for these injuries

On February 18th, at the clinic of the hospital where the defendant physician was in attendance, he examined the plaintiff's arm and found that she had a Colles' fracture, both bones being fractured at the wrist After having X-rays taken, a gas anaesthesia was administered, and the fracture was then reduced, and the arm put X-rays were also taken up in a plaster cast after the reduction of the fracture, which showed a little tilting of the radius The plaintiff was an ambulatory patient, and returned three times a week for examination and treatment for about On each of her visits, the defendthree weeks ant removed the moulded splints, examined the arm, and reapplied the cast During these three weeks, nothing was done to correct the slight deformity, as in the opinion of the defendant noth-

ang could be done at that time

At the end of the three weeks' period, the

At the end of the three weeks period, the splints were removed, and the patient was advised to have baking and massage. At this time, it was found that she had a good union, but some stiffness of the wrist, and was in need of massage. The plaintiff was referred to the baking

and massage clinic at the hospital

The technician in charge of the clinic subsequently reported to the defendant physician that the plaintiff had only called on him four times,

and had then disappeared, and never returned to the baking clinic for any further baking or massage

Some months later, the patient came under the care of another surgeon This surgeon stated that upon examining the plaintiff, he found she had a Colles' fracture which resulted in a malformation of the wrist, that he put her in the hospital, and by manipulation of the hand and wrist, tried to break up the malformation, but was unable to do so as he could not get sufficient pressure upon the wrist Thereafter, this surgeon performed an open operation, and put the arm in a splint, and afterwards in a case While in the hospital at this time, she was seen daily by the surgeon for about three weeks She then visited the surgeon at his office, and under his treatment, finally became well enough to return to her work as a linotypist. When last seen by this surgeon, the plaintiff had fairly good use of her fingers, but not as good as prior to the accident

A physical examination was made of the plaintiff about two years after the original injury. At that time, she claimed that when working she suffered severe pain, and could not work freely, that she could only do part work, and had to lay off for days at a time. She further claimed that when the defendant physician set her arm, it pained severely, and that he refused to adjust it even when X-rays showed the displacement, that she finally went to two other physicians, who operated twice before union was secured, and that since the second operation, she had had great pain, and her nerves were wrecked

The physical examination of the plaintiff's arm at this time showed all motions of the left wrist were limited ten per cent Her hand and arm were wasted from partial disuse Scar of operation on the lower third of left arm over radius-Colles' fracradius was short about one inch ture of the tip of the ulna The arm was well united, but had limited motion and some de-The examining physician further found that the plaintiff was very hysterical and neurotic and emotional, that she had a wrist with a general limitation of motion, and some shortening, that her hysterical state caused her to greatly exaggerate and increase her disability and greatly prolong it

The plaintiff failing to press the case for trial, a dismissal was had of the complaint.

NEWS NOTES

COMMITTEE ON LEGISLATION

The thirty-day period allowed the Governor for approving or vetoing bills that were presed in the last days of the legislature has not expired, but he has acted upon all of them, and following is a statement of the ones that were vetoed by him and the chapter numbers of those that were signed. Those of you who live in rural districts will be particularly interested in knowing that the Gedney bill, Assembly Int. No. 102 (Senate Int. No. 215), has received the Governor's signature.

BILL VETOED

Assembly Int No 639—Dickey, Senate Int. No 706—Lipowicz, the barber bill

1928 ADDITIONS TO THE LAW

Assembly Int No 102—Gedney, Senate Int No 245—Walsh, making reasonable fees of physician for examining persons charged with intoxication in operating motor vehicle or otherwise at time of commission of crime, a town charge—Chapter No 798

Assembly Int No 208—Whitcomb, requiring fire alarm system in asylums, hospitals, orphanages and schools—Chapter No 838

Assembly Int. No 334—Lattin, Senate Int No 221—Webb, appointment of dairy and sanitary inspectors—Chapter No 432

Assembly Int No 784—Shonk, Senate Int No 436—Westall, increasing penalty for unlawful practice of pharmacology—Chapter No 719

* * *

Without exception, we can say this year that the legislators have been our friends and we hope that you and the members of your County Society will let your Senators and Assemblymen know that you are appreciative of their interest and support. A large number of them will seek re-election this fall and if you can aid them any, they, in turn, will be grateful and will be ready to take even a livelier interest in our cause next winter.

Committee on Legislation, Medical Society of the State of New York

SCHOOL PHYSICIANS TO MEET

The school physicians of the State will this year join with the State Medical Society in holding their annual meeting in Albany

Their first session will be in Chancellors' Hall, State Education Building, at 2 30 on Monday afternoon, May 21, 1928

At six thirty an informal dinner, followed by an evening session will be held at the

DeWitt Clinton Hotel No formal papers will be presented, but many matters of practical value will be discussed

Those expecting to attend should advise Dr William A Howe, State Department of Education, Albany, N Y, well in advance of the dinner

MEDICAL WARES

SURGICAL INSTRUMENTS

The surgical instruments dug up from the ruins of Pompen would enable practitioners to do modern surgery, for the knives, scissors, forceps, tractors, and dilators of the first century of the Christian era were almost like those used to-day, aside from the instruments used by specialists. The principal advance in surgical instrument making has been in the use of better grades of steel and refinements of design of the instruments.

There is only a limited field for the sale of surgical instruments for only about 150,000 buyers exist in the United States. The American people with their genius for organization have not entered the field of quantitative production of surgical instruments, for American production to be profitable must be by the millions instead of by the thousands, as in the instrument field. The Germans lead in the quantity production of the ordinary types of surgical instruments, except that the Englishmen excel in the manufacture of surgical needles.

Instruments are stamped with the name of the manufacturer—Imported instruments that bear the name of an American firm must also bear the name of the country in which they are manufactured—This rule is in conformity with a general law that all foreign goods must bear the stamp of the name of the country in which they are manufactured

Americans have manufactured instruments for over a century. George Tiemann and Co is the oldest firm having a continuous existence since it was founded in 1826 at 25 Chatham Street, then on the outskirts of New York City. The George P. Pilling and Sons Company of Philadelphia is the successor of the surgical instrument factory that was started in 1814. A certain type of mind and a liking for the business seemed to be associated with those engaged in the surgical instrument trade.

While quantitative production of staple instruments by machinery is the rule, yet the thrill of the instrument maker consists in the manufacture of special instruments by hand Every reputable instrument maker is asked to supply instruments to be used for certain definite purposes, such as to extract a pea from a small bronchus Frequently he has to plan and make the instrument especially for the intended purpose

The American plant of an instrument maker resembles an old time blacksmith's shop rather

than an organized factory with its rows of automatic machinery and automaton operators. The instrument maker is an artist and a creator who fashions steel bars with hammer, anvil, and open forge. Give a broken instrument to one of the operatives, who has probably been with the company for half a century, and he will duplicate its parts with exactness even to the hardening and tempering. Only the final polishing and plating of the instrument go to another workman

Instruments are made according to various standards and degrees of perfection. The finest instruments, made of the best steel, and by the most skilled workmen, cost more than those made from inferior steel, or by less skilled operatives. Most high-class instruments are made from high carbon steel of which the English Sheffield is the standard form. The steel comes in the form of rods and bars of various sizes from that of a lead pencil to an inch in diameter.

Stainless steel is used to a rather limited extent in surgical instruments. Its non-corrosive quality is due to a high content of chromium, which also renders the steel tough and hard

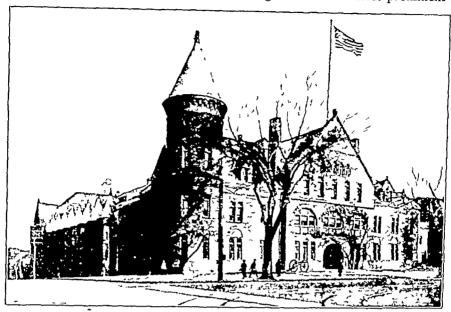

Much of the success of surgical instrument making depends on the process of hardening and tempering the steel The process of hardening consists in heating the forged and partly finished part to about 1400 degrees F and plung-The tempering consists in ing it into cold oil reheating the part to a temperature of 400 or 500 degrees according to the exact tempering required, and allowing it to cool slowly The gradual heating and cooling removes the strains and stresses of the metal and makes it tough in-The workman judges the stead of brittle exact temperature by the color which the object takes at varying temperatures. If a number of similar objects are to be tempered, they may be heated together in an oven whose temperature may be exactly regulated

The manufacturer completes the instrument by the processes of nickel plating and polishing. The smooth and shiny finish is necessary for the maintenance of asepsis, for surgical instruments are subjected to great abuse of boiling temperatures, chemicals, and rust. The care which an instrument receives will determine to a great extent its life and usefulness

THE ANNUAL MEETING

The annual meeting of the Medical Society of the State of New York that will be held May 21-24, in Albany, will be more complete and extensive than any previous one Not only has the

mercial Exhibitors has been in the hands of the Advertising Manager, Mr Joseph B Tufts Fifty exhibitors have taken space, among them being some of the most prominent dealers

10th Infantry Armory, Lark Street and Washington Avenue, Albany, N Y where the annual meeting will be held.

program of the sections and exhibits been planned in great detail under the chairmanship of Dr S J Kopetzky, but the Committee on Arrangements under the chairmanship of Dr J N Vander Veer has provided for the physical needs of the members, the speakers, and exhibitors, down to the last detail The sale of the booths to the Com

The Ten Eyck, corner State and Chapel Streets, where the House of Delegates will meet.

Three new features have been introduced into the programs of the meeting

The scientific exhibit will be on the subject of The Heart, and will be on view during the entire period of the meeting. This exhibit will consist of pathological specimens, charts, and addresses and demonstrations, and since it will be constantly on view the members will have an opportunity to learn about all phases of heart disease

The second innovation will be a general session on the evening of Wednesday, May 23rd, at which different phases of the work of the Medical Society will be presented

The third important feature will be a manufacturer's section, at which a number of exhibitors will be invited to give demonstrations of their wares, and of the events connected with their manufacture and sale. This section will consist largely of stereopticon lectures and moving pictures and should prove of great interest to every visitor. The room in which the section will be held is readily available on the floor of the exhibit hall

The New York Academy of medicine is planning to have an exhibit which will set forth the features of hospitality which the Academy offers to all members of the State of New York

Altogether the 1928 meeting of the Medical Society of the State of New York offers a program which will be more attractive and profitable than ever before

TULIPS AND HUMAN REJUVENATION

The new spapers have been printing accounts of the trial of O W Joslin, former conductor of an electrical health house called the Spectro-Electrical Foundation, for the illegal practice of medicine by the use of a machine called the bio-tactos. The account of the trial given in the Herald Tribune of April 10 reads like the contest between Moses and the magicians at the Court of Pharoah. Whatever Joslin did with the use of bio-tactos, District Attorney Ford did without it. The new spaper said.

"Joslin, who among other features of his treatment, professed to achieve remarkable cures of nearly all human ills through the agency of a radio contrivance called the bio-tactos, attempted to demonstrate its powers in court a

few days ago by rejuvenating a drooping tulip by attaching it to the machine for fifteen minutes and the immersing it in water for half an hour

"Mr Ford, who is prosecuting Joslin, rejuvenated a similarly wilted tulip yesterday by simply placing its stem in a jar of water for twenty minutes without recourse to the biotactos. Joslin admitted on the witness stand that the water achieved the 'miracle,' but insisted that the tulip which had been treated by his wonder box would live longer'

The Herald Tribune of April 11 carried the announcement that the jury found Joslin guilty. The verdict carries a possible penalty of imprisonment from six months to three years, and a \$500 fine.

FOR SAFER CHILDBEARING

An editorial in the Λcw 1 or k Sun of April 18 discusses the action of the Vassar Brothers Hospital, Poughkeepsie, in adopting a unique plan for encouraging prenatal care among prospective mothers. The editorial reads

"To aid in reducing the mortality due to childbearing Vassar Brothers Hospital in Poughkeepsie has adopted a plan which in operation will deserve the most careful study of physicians, health authorities and social workers. The maternal death rate in that city is distressingly high, it is 63 per cent higher than for the State. The infant mortality rate is likewise high, being 46 per cent higher than for the State. These excessive rates may be brought down by proper prenatal care, and to stimulate this the hospital makes this proposal.

"The hospital has set aside a large maternity

ward and has furnished to the 125 members of its staff a copy of 'Standards of Prenatal Care, which is supplied to it by the State Department of Health. To each prospective mother who can present a record of adequate prenatal treatment it offers a flat rate of \$65 for semi-private accommodations, \$35 for ward accommodations, with adjustment according to circumstances for necessitous cases, this charge including all laboratory examinations made by the hospital, use of delivery room, and board and care of mother and baby regardless of the length of their stay in the hospital

"The advantages of this offer for parents are obvious, the benefits it may produce in the community are beyond computation, for the lives, mature and infant, which now are sacrificed in childbearing are of incalculable value"

INTOXICATION BY PERFUME

The legal definition of intoxication is complicated by the question of what the intoxicating agent is The New York *Times* of April 3 comments editorially on intoxication by perfumes and

"A uniform test for intoxication becomes increasingly necessary. The other day there was news of the arrest of two ladies whose closed car was damaged because they were 'intoxicated' Dizziness, faulty vision, and finally the impossibility of keeping her hands on the wheel caused the driver to run her car broadside into a street car. The officer who took charge called a doctor to revive the almost unconscious women. However, a few minutes in the open air restored them, and the physician was called upon for nothing more than an explanation of the curious cir-

circumstances He found it in a large bouquet of spurge-laurel decorating and perfuming the interior of the automobile. The odor of its yellowish flowers is highly narcotic, and the ladies, who had been driving for several hours, were overcome as by the juice of the poppy, or, as the policeman thought, the grape

"Certain perfumes now popular in New York have qualities equally obnoxious to the sensitive nose. Sitting beside an excessively fragrant lady in the theatre does not put one to sleep. It does not even bring on a fit of coughing or sneezing. But it may cause a headache, and when several equally strong odors are fighting for supremacy at a matinee the unscented might well long for a boutonmère of spurge-laurel."

THE DAILY PRESS

FLOP-HOUSES

The New York morning papers of April 4 carried a statement by Dr Louis I Harris, Commissioner of Health of New York City, concerning the sanitation of "Flop houses," or lodging houses, in which the patrons flop down upon the floor and sleep all night there. The Herald

Tribune quotes Dr Harris as saying

"An investigation disclosed the fact that for years homeless men have been exploited in the Bowery without any constructive attempt to come to grips with the problem of providing lodging and shelter that conform to elementary standards of decency, comfort and health, except in the case of a few social agencies. Under the guise of charity men had for years been herded together in some places so bad that some of them have been characterized as reminiscent of the Black Hole of Calcutta. This is what we found

'Flop House No 1—A zigzag shaped cellar with two window openings in the rear, each 32 x 70 with a 16 fan and no other ventilation. There is but one exit from this cellar and in case of fire this would be a death trap. Occupied as a rule by at least 200 men, allowing by actual measurement 127 cubic feet per man, whereas by law the minimum standard for lodging houses—

which is none too high—is 400 cubic feet of air space. Two toilets and one wash basin constitute accommodations for 200 men, in gross violation of the sanitary code. Here the men sleep in their clothes on the bare floor a tangled mass of humanity. When I called those who were accessible by telephone and learned of the difficulties which the homeless men were encountering, I got in touch with the American Red Cross and subsequently with other social agencies through the Welfare Council of New York City. Last Saturday night the American Red Cross delivered 230 beds to three of these flop houses and enabled them to offer human accommodations to the unfortunate down and outers.

"The Welfare Council, which is the clearing house and co-ordinating center for official and unofficial social and health agencies for the City of New York, helped me to effect a prompt communication with the Salvation Army and certain branches of the Y M C A I cannot be too emphatic in expressing my appreciation of the generous, fine and cordial spirit with which the Salvation Army, the Y M C A, the American Red Cross and the Welfare Council have met demands that have been made upon them by me."

HEALTH DEPARTMENT STORES

The proposal of the State Charities Aid Association to establish sixty health centers in New York City has inspired the New York Herald Tribune of April 13 to carry an editorial entitled "Department Stores of Health" The promotors of the health centers plan to bring all forms of public health service of a neighborhood together under one roof, with one management. The editorial says

"The value of this phase of team work has notable recognition in Boston, thanks to the generosity of George Robert White, who made a bequest of \$6,000,000 for the erection of works of public utility which might best serve the people of the city. The trustees of the fund agreed that the purpose of the gift would best be carried out by building a series of district health units. Three of these centers have been constructed. The complete chain will supply every section of Boston with a health department store."

The plan of the department stores of health is based on the statistical method of treating diseases promoted by lay administrators, in

distinction from the personal method, promoted by the medical societies of the counties, states and nation. That phase of the practice of medicine is discussed on page 530 of the editorial department of this Journal. An editorial in the New York Times of February 24 entitled

"Bought Health" concludes

'Health in some measure, at any rate, is purchasable This is demonstrable, and in the experience of the health centres, where the medical profession, the nursing profession and the social worker are brought together in their preventive and curative service, it has been demonstrated to such an extent that their continuance is considered 'inevitable' That twenty-one agencies led by the New York Health Department have been held together under one roof, pooling their experiences, in their service to a district in this state with 100,000 people is in itself significant and promises both bought and unbought health The most serious problem seems to be that of a completely satisfactory working relationship between the medical profession and the social agencies"

OUR NEIGHBORS

ARTHRITIS DEFORMANS

Arthritis deformans is one of the most pathetic of all diseases, and the physician feels helpless in its presence, yet there is much which he can do to relieve the suffering of the patients and to preserve the usefulness of the limbs whose joints are diseased

This subject is discussed in the February issue of the Kentucky Medical Journal in an article by Dr John D Trawick, of Louisville The article is illustrated with photographs of dislocated wrists, ankylosed knees, and other deformities of which the average physician knows little from personal observation. These patients are often the victims of promises made by cloven-tongued quacks. When one of the quacks visits a city, he draws the helpless cripples from miles around,—but fortunately this does not occur in New York State.

Dr Trawick, speaking of the deformed group without known cause, says

"From this group we find recruited the growing mob of cripples already referred to as a very real medico-social problem

"We find them in every hospital chronic ward, in all orthopedic clinics, in homes for incurables, kept by church societies, supported by weary friends and relatives, eagerly thrust out into any school, or institution that will take them and thus relieve their former caretakers

"What can be done for these? How to give them relief? How to make themselves selfsupporting? How to relieve their joint fixations, and their distorting contractions, so that if possible they may make even part of a living? These are the questions that confront I dare say there is not one of you, but has had some Rotary or Lions or Kiwanis Club urge you to take over the conduct of treatment or supervise the transfer of a chronic arthritic out of their wearying care into some other haven Here the orthopedic surgeon finds For unfortunately to him they his burden come trooping, usually after they have been everywhere else, passed on out of your capable hands into the care of those less worthy to minister-into the grasp of the charlatans and the quacks They found him perhaps with a little money saved out of his labor, with their ghoulish hands, clawing about his stiffening joints urging their treatments through months of futile promises of relief, they have at last squeezed him bone dry His funds exhausted, his home sold, his family impoverished, they have thrust him out and left him there on the

human dump heap a wreck, a distorted human

being, miserable, dependent!

"Surely here is problem enough for every group of specialists to unitedly study. Here is scope for organized effort. The orthopedic surgeon may contribute something to the internist and both find their knowledge increased by the pathologist, all three welcoming the bacteriologist into the conference. Wisdom shall perhaps not die with either of us, not one or the other claim to have all knowledge.

"Pain is an early and constant accompaniment, in fact it is doubtful if some arthritics ever had relief from pain since their disease began, certainly not while the inflammatory process was active within the joint capsule, while cartilage and bone were being involved With some however there came less of pain when gradually erosion of cartilage had occurred and bone had joined to bone, with firm ankylosis and further immobility of the joint Fixation and loss of function were the price to pay for relief from pain

"In others there were through the weary months and years, a continuous contraction of muscle and tendon with no kindly restraining force or counter pull Joint surfaces became ivory like, eburnated, glistening and smooth Dislocation occurred, fingers, hands at wrists, knee joints, subluved, and held in fantastic dis-

tortion-utterly useless

"The orthopedic conscience recoils at this It is entirely repugnant to think of deformity occuring that might, perhaps, have been prevented Even though there may not have been a remedy for the process, a light mechanical support could have no doubt, been used to prevent dislocation Or an elbow or a knee, or a hip joint in which the process of ankylosis and rapid deposit of callous occurred might have been placed in an angle of election, and the ankylosis which seemed inevitable could have occurred with the elbow flexed at a convenient angle rather than in helpless extension, or the knee at a walking angle, or the hip placed so that standing perpetually might not have been necessary, nor sitting, a permanent condemnation

"By position and release of body strain with a gentle but persistent extension of the whole frame we have seen these flexed distorted bodies become more mobile, and respond more readily to the systemic treatment, elimination, tonic and otherwise which had been instituted

(Continued on Juge 544-adv rvin)

(Continued from fage 544-adv xivii)

Of recent years there has been frequent disussion in medical journals and before societies regarding the status of the clinical laboratory, which represents one of the recognized specialhes in the medical profession. It is frequently lamented that laboratory work has so largely fallen into the hands of lay technicians, and has been utilized for commercial exploitation to such an extent in some sections that skilled laboratory workers have even contemplated withdrawal to other forms of professional activities

At the annual meeting of the American Medkal Association at San Francisco, in 1923, representatives of the American Chemical Society and the American Association of Pathologists and Bacteriologists petitioned the national organization to undertake supervision of clinical laboratories and to counteract, if possible, the dust toward lay commercialism as developing The whole question was in laboratory work referred to the Council on Medical Education and Hospitals They proceeded to secure a complete list of laboratories in the country, and prepared a schedule of essentials for an approved clinical laboratory which was adopted by the House of Delegates at its 1926 session A questionnaire was utilized by which the detailed facts regarding each laboratory could be obtained Information concerning each was supplemented through the assistance of committees of laboratory experts appointed in each state At the present time three hundred and fourteen laboratories have reported to the Council, of which one hundred and fifty-one, after careful investigation, have been placed on the approved list. Other applications for approval are constantly being

The purpose of the Council in these investigations is to render every possible assistance to laboratories that they may become eligible to the accepted list Each is informed regardmg its deficiencies, and the spirit of the movement is constructive throughout all its efforts is a result of these labors it is reported already that a number of laboratories formerly run by technicians, and only nominally under medical apervision, have come under the ownership and actual control of clinical pathologists of high standing and ripe experience A group of laboratories under control of technicians has gone out of business, and there is an increased demand for pathologists to man the clinical laboratories of the country the Mayo Foundation has stated that salaries offered their pathologic graduates are double those offered other graduates of the Founda-

A Sure Source Vitamins A and D

Tested for Your Protection

Clinical evidence has demonstrated the high vitamin potency of Patch's Flavored Cod Liver Oil It has received nation wide professional endorsement But that is not enough! We must test every lot of oil made in our plants to guarantee its vitamin potency

Vitamin A Guarantee

The least amount of cod liver oil required daily to promote a renewal of growth in albino rats that have ceased to grow and may show symptoms of malnutrition such as zerophthalmia on diets adequate except for vitamin A is considered as one vitamin A unit. We guarantee more than 500 vitamin A units per gram

Vitamin D (Antirachitic) Guarantee

The Antirachitic or vitamin D potency of this oil is determined by a modification of the method described by McCollum, Simmonds Shipley and Park. The least amount of cod liver oil required daily during a period of eight days to promote recalcification in the tibia of young albino rats suffering from experimental rickets is considered as one vitamin D unit. We guarantee more than 75 vitamin D units per gram

While the quantity and quality of available sunlight may or may not be adequate to meet the needs of grow ing children here is a sure source of vitamin potency

(Continued from page 546-adt 11)

v of warm water bottles placed outside the ner blanket. In acidosis the skin is abnorally sensitive to heat, so we must insist that ie water bottles be only warm and not hot, not that they be placed outside the inner blanet. So our third order will read, 3. Apply circular heat with warm blankets and warm bags utside the inner blanket. Do not let bags come n contact with patient. Such an order will usually obviate the necessity of treating burns, which in the diabetic, and particularly in the interiosclerotic diabetic, frequently become gangrenous and heal very slowly.

Our patient in acidosis is always dehydrated, and the application of external heat will serve for the further desiccation of his tissues Obviously our next duty is to supply fluids in a suitable form so that we may dilute his acids and facilitate their elimination. If the patient is conscious and can drink and retain 8 ounces of fluid every hour, the problem of administering the fluid is solved. The fluids should be hot, but the patient will not drink such a quantity of hot fluids The patient prefers cold fluids, but the ingestion of such a quantity of cold fluids would not only be a needless sacrifice of body heat, but would invariably lead to vomiting Therefore let us alternate hot drinks with cold So for our fourth order let us say, 4 Give 8 oss of tea, coffee, water or clear meat broth q 1 h for 6 hours and then q 2h, alternating hot drinks with cold until the patient is sugar free When he is sugar free we will substitute orange juice or oatmeal water for some of the above fluids

But when our patient is comatose or semicomatose and has vomited, as is usually the case, we have quite another problem. The passing of a stomach tube may be a life saving measure. In Joshin's clinic lavage is a routine procedure in all cses with a plasma CO2 of 20 vol per cent or less. After lavage nothing should be given by mouth so long as the patient is nauseated or semicomatose.

Here we must depend upon hypodermoclysis and we can easily give 1,000 c c of normal saline with one per cent glucose every four to six hours. The lower bowel should be emptied with an enema and can later be used for the administration of glucose solution by retention enema or Murphy drip. Glucose by bowel is best given as a five per cent solution, which, under certain conditions of a complicating fixed acidosis, may be incorporated with a three per cent sodium bicarbonate solution. An investigation of the blood and urine chemistry should be started at the earliest possible moment.

The above orders may be satisfactorily carried out on urine examinations alone, but be

It is stated that there is a more hopeful at titude on the part of clinical pathologists themselves, and there seems to be less feeling of unsteadiness in this specialty than existed a few years ago It is not known to what extent doctors have actually discontinued sending specimens to unapproved and are concentrating their work for approved laboratories. The character of the laboratories of the future and the reliability of their work rest entirely with the medical profession of any community li trained medical men are to devote their lus to this specialty, they must receive the support and cooperation of the professional men and women among whom their work is conducted If their patronage is to go to nonmedical institutions, the permanency of this specialty will be jeopardized and well-trained physicians cannot be expected permanently to undertake this this work

DIABETIC ACIDOSIS

The management of a case of diabetic act dosis and coma is described by Drs Wendt and McLean of Detroit, in an article in the March Journal of the Michigan State Medical Society from which the following abstracts are taken -Editor's note

The difference between diabetic acidosis and coma is one of degree only, in the first case we are treating acidosis in a conscious patient and in the second in an unconscious patient In no medical condition do we find our patients in greater danger An ideal treatment would fall little short of constant personal super-

Our first problem is the conservation of the patient's energy, which can be best accomplished by confining him strictly to bed This will lower the metabolism and inhibit the formation of ketone bodies It sometime happens that the patient is restless or even mildly maniacal Such patients are not easily handled, so it is imperative that our first order should state specifically, 1 Confine strictly in

Morphin should seldom if ever be given, and most certainly never without the consultation and advice of a competent surgeon who has had special experience in such cases

So it is well in handling these cases that our second order should read, 2 Do not use mechanical restraint, sedatives or opiates

Our next problem is the preservation of body This is best accomplished by covering the patient with warm blankets, and may be advantageously augmented by a liberal sup-

fore we go much further we should know the level of the blood sugar, NPN, and CO2 of the alveolar air and plasma These findings will influence our subsequent course of treatment The blood sugar reading will furnish a reliable guide for the administration of insulin A high NPN will warn us of a fixed acidosis and a possible impending uremia, and will influence to some extent our dosage of insulin The CO2 of the plasma and alveolar air furnish an accurate index of the efficacy of our treatment and the prognosis of the case So for our fifth order we will write, 5 Blood sugar, N.P.N. and CO2 of the plasma and alveolar air

Diabetic patients are subject to many forms of coma, but insulin is indicated in the treatment of only one of them Having decided that our case is one of true diabetic coma we will give insulin The amount to be given at the first dose will depend upon the physical condition of the patient and the amount of sugar in the urine If the patient is in extremis a dose of 20 or even 30 units may be administered, a part of which may be given intravenously

INFANTILE PARALYSIS

When the cause of a disease escapes identification, many clues are likely to point in the general direction of a clear solution of the mystery, but yet they may entirely miss their mark The following editorial in the April issue of the Journal of Missouri State Medical Association describes such a possible explanation of the cause of infantile paralysis—Editor's note

An interesting hypothesis was advanced by Dr Marsh Pitzman, St Louis, at a recent meeting of the St Louis Medical Society, namely, that infantile paralysis was not a virus disease and not an infectious disease at all, but was caused by a mixture of atropin and hyoscin transmitted through the milk of cows which had eaten jimson weed

Dr Pitzman arrived at his idea through a series of "coincidences" which he believes to be more than mere coincidence The disease is most prevalent in the early spring, when the weed is about the only green thing showing in the cow pastures, and in the late, hot summer, when jimson weed is about the only herbage left unwithered

It is more prevalent in New York City, served by many small dairies, than in St Louis, served mainly by two large dairies in which mixing of a little "poisoned" milk with a great deal of milk from cows which had not eaten the weed would reduce the toxic content He found records to an innocuous amount

noted surgeon Honestly, as we recall our college days, it really seemed that to most students the surgeons were the gods of the faculty

Perhaps it was the audacity and resourcefulness of the surgeons which prompted us to want to follow in their footsteps in later life. We are sure it was not from a financial view-point because we as students knew little about what fees were being received as most of the cases we saw operated upon were at the County Hospital and elsewhere and no fees were received. But we believe at least 75 per cent of the younger classmen deep down in their hearts cherised the hope that some day they would be known as surgeons.

But ought medical students, say 75 per cent of them, ever try to become surgeons? No

It requires above all a natural mechanical mind to produce a surgeon. The student who does not have a natural love to fix things no matter how small and simple they may appear, will never make a success as a surgeon.

In the college days of thirty years ago the bicycle was the favorite mode of transportation to and from college and to the hospitals. An examination of the mechanical condition of these bicycles would have shown just who ought to have been encouraged to take up surgery for their lifes work and who ought not to have considered such a course. Surely a man who could not keep his bicycle in perfect running condition would ever be able to understand and repair that master machine, the human body

We never quit studying and trying to improve ourselves. The field of children's diseases, obstetrics, skin diseases, heart, lungs and nervous diseases—why not take up one of these lines of usefulness and by special study endeavor to know more about one of these than any doctor in your community?

You need not give up your general practice, but increase your knowledge and ability so that other men in the profession will refer cases to you in your special line

We owe it to ourselves and to the public to chop off the heads of about four-fifths of the surgeons now inflicting themselves on the American public, or at least point out the importance of other lines of usefulness in the great subject of human illness, its prevention and cure

Second Edition, Revised and Enlarged

Bodkin's Diseases of the Rectum

By MARTIN L BODKIN, MD, F.ACS

Rectal Surgeon St Catherine's Hospital Associated Surgeon, Broad Street Hospital New York

The entire text for this edition has been carefully revised and amplified. Several important new chapters have been added

The application of bacteriology to the causes of the different types of the simple catarrhal diseases of the colon and rectum and the treatment of these diseases are satisfactorily explained in a special chapter. This information of the cultivation of bacteria from the food we eat has heretofore been so meager that the average practitioner and student could not apply his knowledge in a practical manner to either medicine or surgery.

medicine or surgery The editorial view must be broad rather than intensive Contributions of an obviously technical nature will find their way into specialist journals. The article for this publication, while it may be written by the specialist, will have a broader appeal.

The editing of a medical magazine is somewhat like standing behind the radio transmitter or talking into a dictaphone. There is a certain loneliness about it. The audience in the case of the radio and the editor is in front, but invisible, the response is not immediate. If the time comes when the reader no longer removes the wrapper from his journal, it means editorial failure. We, therefore, welcome criticism and suggestions for improvement.

One or two new features might be mentioned, for instance, the column of general medical news consisting of short, condensed paragraphs, embracing current happenings at home and abroad, secondly, the Doctor's Library with an introductory paper written by some book lover in the profession purpose also to print from time to time reports of clinics or staff meetings showing the actual discussions which take place at various hospitals in the State In this way the Journal will fill the role of clearing house for the ideas of men in active performance of the work You may be located far from the madding crowd, yet this fact does not preclude you from sending in an account of some interesting case or The very situexperience you may have had ation which places you on your own resources has given you a marked advantage over your confrere in the city who has only to step to the telephone for assistance But, however remote or isolated your location, we shall be pleased to hear from you

SURGICAL ASPIRATIONS

The brilliant rewards of medicine go to the surgeons They hold the center of the stage and often collect fees commensurate with their prominence. Theirs is the specialty to which the greatest proportion of recent graduates aspire, and the number of aspirants is far greater than the needs of the field.

This condition is discussed editorially in the Wyoming Section of the April issue of Colorado Medicine —Editor's note

It is a common idea of most medical students while in the pursuit of their medical courses that surgeons are the top of the scientific ladder.

The young student has a desire, which is almost all-consuming, to want to become a

SYMPTOMS, DIAGNOSIS, AND TREATMENT OF ACUTE CRANIAL AND INTRA-CRANIAL INJURIES*

By MAX MINOR PEET, MD, FACS, ANN ARBOR, MICH

It is eminently desirable to consider injuries of the brain and fractures of the skull together, although either may occur independently. Too much emphasis, however, has been placed upon the fracture alone and too little upon the resulting intra-cranial damage. In fact we believe the presence of a simple fracture is of significance only as indicating a certain degree of trauma to the head. The treatment of skull fractures is in reality the treatment of the resulting intra-cranial injury, or designed to prevent intra-cranial infection.

Fractures of the skull are often considered under two main heads -fractures of the vault and fractures of the base. There seems to be a rather general opinion that the latter are much more serious, but from the standpoint of the actual fracture, it makes little difference whether the vault or the base is involved, the treatment is essentially the same. The difference in mortality noted between fractures in these two locations is due to the difference in coincident brain damage Fractures of the vault are often due to localized trauma while those at the base are almost of necessity due to a r ssive blow. A fracture of the base, therefore, generally indicates a much more severe blow and consequently a more severe Fractures of the base are intra-cranial injury more commonly compound, in that they frequently involve the cribriform plate or the petrous portion of the temporal bone, and with the commonly associated rupture of the tympanic membrane give an open communication between the external auditory meatus and the subtentorial space. It is for this reason that a linear fracture of the base is more likely to result in meningitis than a linear fracture of the vault

For convenience we use the old classification of skull fractures, dividing them into simple linear, depressed and compound. As before stated the simple linear fracture involving the vault of the skull, considered alone, is of no consequence. It may, however, have torn the middle miningeal artery with resulting hemorrhage and an extradural clot. Symptoms and treatment of this com-

* Read at the Annual Meeting of the Medical Society of the State of New York at Magara Falls, N Y May 10 1927

plication are discussed under secondary brain injuries. Linear fractures of the base, because of their tendency to involve the cribriform plate or the petrous portion of the temporal bone, are of considerably more significance, but here again the fracture in itself does not require operation or any special type of treatment. The surgical therapy indicated being to prevent subsequent meningitis

In every case of basalar fracture with rupture of the tympanic membrane and the escape of blood, cerebrospinal fluid, or both from the ear we believe the following routine should be fol-The external canal is mechanically cleared of blood clot, wax, etc., by either the use of an ear spoon or of cotton applicators canal is then filled with 3½ per cent tincture of iodine and the pinna is sterilized with the same The head is then rotated, allowing the iodine to drain from the external auditory canal and sterile dressings are applied to the entire ear Under no circumstances is the external auditory canal plugged The dressing should be changed as frequently as it becomes wet through. In some cases where the discharge of cerebrospinal fluid is very profuse and the dressing becomes saturated within a few minutes, we have made a practice of applying a large dressing moistened with acriflavine. This makes unnecessary the very frequent changes otherwise required. When following this routine we have had no case of meningitis develop One patient in whom the technique was not followed developed meningitis This was a patient with a basalar fracture with a rather free discharge of blood from the ear for the first few hours. Our technique was carried out and for a week the patient's condition was excellent He then complained of his ear feeling stopped up and through a misunderstanding the canal was irrigated to remove the dry blood clots The following day frank symptoms of meningitis developed and death ensued in three days believe that in this case irrigation of the ear was the direct cause of the fatality If there is any definite indication to remove clots from the ear this should be done under absolutely sterile precautions and the clots should be removed mechanically, not by irrigation

EX-PRESIDENTS IN SOUTH CAROLINA

The physicians of South Carolina, like those of New York, believe in utilizing the experience of their past-presidents, by making them members of the House of Delegates, although New York does not permit its ex-presidents to vote. The following editorial from the March issue of the Journal of the South Carolina Medical Association shows how the past presidents are honored in that state—Editor's note.

We believe no State Medical Association has a finer, more enthusiastic body of men constantly working for the interests and ideals of the state organization than the ex-presidents of the South Carolina Medical Association There are about twenty of them living and every one of them active By virtue of an amendment to our Constitution and By-Laws some years ago ex-presidents are accorded all the privileges of a delegate in the House of Delegates This means that nearly one-third of the House may be made up of ex-presidents The innovation has worked very satisfactorily The experience, wisdom, whole-hearted desire to serve, and more important, willingness to serve, constitute an inspiring leadership calculated to advance organized and scientific medicine in South Carolina to much greater heights

Many State Medical Associations have a place and a plan at the State Meeting to honor in some definite way their ex-presidents. The JOURNAL would like to see this done in our State and will gladly receive suggestions as to how the idea may

be carried out at Columbia

HEROIN

The March issue of the Atlantic Medical Journal contains the following editorial on heroin which will be news to many physicians of New York State—Editor's note

Our readers will recall that, by action of Congress, no more heroin can be made in the United States, nor can any of the drug be imported, so that, after the supply then in the United States is used up, it will no longer be possible to secure this preparation of opium Druggists state that the supply must now be exhausted, as it is no longer procurable

Many prescriptions are still being written for heroin, and we are credibly informed that some druggists are substituting two grains of codein sulphate for each grain of heroin, without calling the attention of the physician to the change, while the more considerate druggists are advising physicians, when prescriptions containing heroin are received, that the drug no longer is procurable

We therefore call the attention of our members to this situation, and advise them to discontinue the prescribing of heroin, bearing in

mind codein

a combination of irrigation and suction, blood clots and lacerated brain tissue are removed together with small bone fragments and foreign In bullet wounds of the brain suction is a very valuable method of cleansing out the deeply penetrating wounds. We do not believe in The catheter can be passed finger exploration for several inches into the brain substance keeping up constant suction and in this way many small bone fragments can be removed which would otherwise escape detection All bleeding points should be controlled by the application of silver clips, fine silk ligatures or by the application of Under no circumstances should muscle grafts packs be left in place to control bleeding, nor should drainage of any kind be instituted simply invite infection Probably the most troublesome bleeding is that arising from large pacchionian bodies in the dura Occasionally these can be ligated by a through and through dural It is usually necessary, however, to control bleeding by the application of a small muscle graft, removed from the exposed temple muscle or if necessary from the leg At times it is expedient to obtain a piece of muscle from some patient being operated in an adjoining room

After excision of the lacerated scalp, traumatized muscle, etc, instruments used should of course be discarded Examination of the underlying bone may show only a fine linear fracture. Many surgeons feel it is safe to ignore such an innocent appearing lesion, but we have frequently found hair and other foreign bodies caught in the fracture line Apparently at the moment of impact, there is a slight separation of the fracture line and foreign material is driven in The crack in the skull then closes, perhaps completely hiding from view infected foreign bodies. The outer table along the fracture line should be removed with a gouge or electric burr. If foreign material is then found it may be necessary to remove a wedge of the diploiac layer and at times the inner table as well

Compound comminuted fractures present a more serious problem and much hesitancy is generally shown in discarding many bone frag-We believe the assurance of absolute sterility far outweighs the disadvantage of a cranial defect Bone fragments, even if rather large and with some pericranial attachment should be removed if evidently contaminated It is often possible to preserve the major portion of fragments to either side of the scalp laceration by simply rongeuring away the potentially infected Certainly, however, all fragments immediately beneath the open wound should be discarded even though the resulting cranial defect assumes considerable proportions. The loss of a portion of the skull is really of little moment provided infection can be prevented. Such a cranial defect is largely of cosmetic interest and can be closed by an external table graft at a later date if found advisable.

Closure of the wound is of the greatest impor-In rases of compound skull fractures, we do not advocate closure of the dural defect by a fascial graft since there is always the possibility of some infection being present. It is imperative, however, that the defect in the skull and dura be closed water tight by the overlying scalp When, as not infrequently happens, the excision of an extensive laceration of the scalp leaves a defect too large to be closed by simple approximation, the defect in the skull can be closed by turning a scalo flap from an adjacent region While this still leaves a denuded area, the skull beneath has not been opened and is in fact covered by pericranium and the aponeurosis of the occipitalfrontalis muscle This area can be skin grafted when covered by healthy granulations

Trauma of the brain may for convenience be divided into several groups, depending entirely upon the amount of damage present. We classify our cases of primary brain damage as follows—first, temporary unconsciousness without indication of brain injury (concussion), second, slight laceration or contusion of the brain, third, extensive brain damage, fourth, massive brain injury.

Secondary brain injuries fall into the following groups—first, pressure from an extradural hemorrhage, usually from the middle meningeal artery, second, intradural hemorrhage, generally from large cortical veins near the superior longitudinal sinus, third, subdural accumulation of fluid, usually of very insiduous development, fourth, hemorrhage from the veins of Galen

Of course, these various groups intergrade and it is frequently impossible to place a patient in any particular group on first examination. We have previously emphasized the point that fracture of the skull in and of itself requires no treatment except for the relief of continued pressure upon the brain or for the prevention of infection. Our chief interest in cranial injuries, therefore, centers upon the treatment of the intracranial injury, i.e., the prevention of increased intracranial pressure or to the reduction of pressure already present.

The term concussion, supposed to denote temporary brain changes due to a slight injury, although probably with actual minute lacerations of the brain substance, has been in use so long that it is practically impossible to eliminate the term To clearly define concussion, however, is impos-When used it should be confined to those patients temporarily unconscious from trauma, but who quickly regain consciousness and show no evidence of organic brain injury In these socalled "concussion" cases in which the patient is temporarily unconscious or at least in a semicomatose condition with a normal blood pressure and an essentially normal pulse and respiratory rate, recovery will probably take place without We believe, however, any specific treatment that even in this comparatively simple condition,

much more serious problem Unfortunately, they do not show in the X-ray and the majority of cases cannot be definitely diagnosed unless there is a discharge of cerebrospinal fluid from the nose With the latter meningitis frequently de-We believe that whenever a definite diagnosis of a fracture through the cribriform plate can be made as indicated by the discharge of cerebrospinal fluid from the nose, operation is indicated The technique consists of opening the skull near the midline and above the frontal sinus The dura is elevated backwards until the fracture through the cribriform is completely exposed An iodoform gauze wick is then packed between the laceration in the dura and the cribriform plate, the end of the wick being brought out through the frontal incision This wick is left in place for four days and then carefully removed The object of this procedure is to prevent meningitis by allowing the brain to become firmly adherent to the lacerated dura thereby effectively closing off the subarachnoid space before organisms passing through from the nose can cause infection

In compound fractures of the frontal regions, which at operation are found to involve the cribriform plate, the same technique should be followed. This technique constitutes the only exception to the rule never to leave packs or drain in a clean case. If the dural laceration is small, a graft of fascia may be expeditously used thus eliminating the danger of the drain, since immediate tight closure is then possible

We believe that all depressed fractures of the skull should be operated, even though the amount of depression seems to be slight. It has been our experience that the X-ray evidence of the amount of depression is always fallacious and that a much greater displacement of the bone fragments will always be found than is apparently present from the X-ray plate This is true when the X-ray technique is perfect and numerous stereoscopic Roentgenograms have been made in various directions The usual reasons given for operation of depressed skull fractures are the relief of immediate pressure upon the brain and for cosmetic pur-Because slight depressions do not seem to come within this group the majority are not elevated However, if the rule is made to expose and elevate every depressed fracture the surgeon will be surprised by the actual amount of damage frequently found beneath the depression, damage which may eventually result in a traumatic cyst with the possibility of focal epilepsy The fragments should be elevated and sufficient bone temporarily removed so that the dura is adequately The dura should be opened and if, as frequently happens, traumatized, lacerated brain tissue is found, this should be carefully but thoroughly removed by irrigation and suction is no question in our minds that the devitalized brain tissue has a lytic action on the normal adja-It has been conclusively proven that

as soon as the blood supply in any portion of the brain is destroyed that portion immediately becomes extremely edematous, and it is probable that some of the resulting softening is due to pressure from this edematous brain as well as due to chemical action of the dead brain sub-If this injured brain tissue is removed, the adjacent normal brain is protected from further damage and a vicious circle prevented. The ultimate amount of brain injury is thereby materially reduced When not contaminated, bone fragments should be preserved and it is frequently possible to reconstruct even extensive areas such as large portions of the parietal bone, completely relieving pressure upon the brain and preserving the normal contour of the skull Even if the fragments are completely detached they will generally heal in place and be united by fibrous tissue, often by new firm bone

It scarcely seems necessary to say that every compound fracture should be operated, yet we frequently see patients with laceration of the scalp and suggestive evidence of underlying fracture in whom the chance has been taken that the laceration does not actually extend to the bone Compound skull fractures should be operated both from the standpoint of preventing infection in the bone and for the far more important reason of preventing an extra dural or brain abscess or Operation should be performed as meningitis We do not, of soon after injury as possible course, advocate operation during the period of shock, but with this one exception believe the indications for immediate operation are self-evident Unavoidable delays do not mean that subsequent operation should not be done and it is sometimes possible to operate after 24 or even 48 hours and obtain primary healing The technique as evolved by Cushing during the war has been found highly satisfactory It consists essentially in complete debridement, exactly similar to debridement of wounds in any other region Whenever possible local anesthesia is the anesthetic of choice Ether, ethylene or nitrous oxide may be used, but they all elevate the blood pressure, cause bleeding from the scalp and definitely increase intra-cranial pressure. An operation which may be comparatively simple under local anesthesia may assume serious proportions under a general The laceration in the scalp should be completely excised, the incision passing through normal tissue All bone fragments which are potentially infected A laceration of the dura should be discarded The only difference should likewise be excised between debridement in other regions and here is the treatment of the brain Lacerated or pulped cortex should not be excised, but should be removed by irrigation and suction The asepto syringe with catheter attached makes a very excellent suction apparatus and there is no danger of injuring untraumatized brain tissue tion should be thorough, preferably with Ringer's solution, although normal saline can be used By

definite that the diagnosis of an increasing intracranial pressure is simple. Because of other injuries which may be coincident with the head injury certain of the typical symptoms may be masked, or entirely wanting This is particularly noted when severe hemorrhage has taken place, fat embolism has occurred, or the patient for some other reason is in a state of shock We must also remember that although the chief signs are all due to irritation of the medulla, this structure may be more irritated or more severely damaged in one part than another For example, the vagus center controlling the pulse rate may be simply irritated while the blood pressure center has been The complete picture of severe inparalyzed tercranial pressure may be therefore wanting We believe the diagnosis can be made if any one of the cardinal symptoms is present, even though the associated signs point in an entirely different Nothing but pressure on the medulla will give a progressive slowing of the pulse, a rise above normal in the blood pressure, or a slowing and deepening of the respirations it is pressure upon the medulla in which we are chiefly interested and to which we particularly direct therapeutic attention

The typical signs and symptoms of rapidly increasing intracranial pressure are drowsiness, progressing to complete coma, a slowing of the pulse rate, in some cases to 40 per minute, or even lower, a slowing of the respiratory rate going in extreme cases just before death to three or four a minute, or a change in the respiratory rhythm with the development of Cheyne-Stokes breathing, a progressive rise in blood pressure, frequently a rise in temperature

These changes may appear within a few minutes, or develop so insidiously as to be overlooked until far advanced. It is imperative, therefore, to make frequent, specific observations. As a rule we request a record at 10 minute intervals of the pulse and respiration rates and if the symptoms are at all alarming, blood pressure and temperature readings should be made as frequently. The question is frequently asked—how much of a reduction in pulse or respiration rates is necessary to make a diagnosis? Of course the probable normal rate for the particular individual must be considered. In children the normal pulse rate especially is usually above that of an adult

A reduction in pulse from 70 to 60 per minute makes one immediately suspicious of increasing medullary compression. Anything below this should call for immediate treatment. A reduction in respiratory rate to 15 or 16 per minute is strong presumptive evidence of increased pressure. We should not wait until the pulse registers around 40 and the respirations about 10 or 12 per minute. A rapid lowering of either pulse or respiration rates is even more serious than a gradual fall. Should short periods of rapid pulse or respiration alternate with longer periods of a slow rate, it is a warning of imminent medullary

collapse When the medulla has become paralyzed nothing the surgeon can do will save the

oatient.

The temperature should always be taken per rectum, by any other method erroneous opinions will be formed. On several occasions we have seen patients with a mouth temperature of 100° or 101° and a rectal temperature of 106°.

Treatment of increasing intracranial pressure of traumatic origin is by lumbar puncture, subtemporal decompression, administration of hypertonic solutions, and for the coincident hyperther-

mia, ice packs

We believe lumbar puncture a safe procedure in these cases, in spite of some published opinions to the contrary A lumbar puncture can be performed quickly, easily, and with a minimum upset to the patient. We make a practice of performing lumbar puncture immediately on admission of every patient showing the manifestations of increased intracranial pressure of traumatic There is no rule as to how many cc. of origin cerebrospinal fluid should be withdrawn fluid should be allowed to escape until it comes drop by drop, te, until the increase in spinal fluid pressure has been completely reduced times this simple procedure is a definite life saver and at times constitutes the only therapy needed Lumbar puncture can always be performed while preparing for more elaborate therapeutic measures

There have been many advocates for subtemporal decompression in traumatic cases lieve the only indication for this operation is the presence of localized pressure symptoms as occur from middle meningeal hemorrhage. We fully realize that this is contrary to the usual practice, but base our opinion on the far more satisfactory reduction in pressure which can be obtained by the intravenous introduction of hypertonic solu-We have all had the experience after a right subtemporal decompression of finding the pressure symptoms little improved, thereupon performing a left decompression, and in many cases still having alarming pressure symptoms tirely aside from the question of an unnecessary operation, which we feel it really is, there is a definite risk in subjecting such a patient to the added insults of an operation, even though it is performed under local anesthesia. We have had the opportunity on several occasions to observe a definite, rapid, and entirely satisfactory reduction in intracranial pressure by hypertonic solutions in patients unbenefitted by subtemporal decompression performed a short time before

Hypertonic solutions may be administered by oral, rectal, or intravenous routes. The oral or rectal administration of a saturated solution of magnesium sulphate, will frequently relieve severe headache of traumatic origin. The more severe cases are best treated by intravenous salt or glucose solution. A 15 to 35 per cent solution of sodium chloride in amounts ranging from

measures to prevent subsequent edema are indi-Then too it is extremely difficult on first admission to state whether a particular patient has a simple injury or one which will shortly manifest symptoms of a much graver nature. If the patient is still in coma on admission, we immediately withdraw cerebro-spinal fluid by lumbar puncture and administer 100 cc. of 50 per cent glucose intravenously Return of consciousness is often very rapid and it has been our experience that patients so treated did not have the usual excited, delirious stage or that this stage was greatly shortened Subsequent headache, nausea and vomiting is also materially reduced It is evident that in the simplest cranial trauma associated with unconsciousness there must frequently be some brain edema.

Local pressure manifestations either irritative or paralytic, as evidenced by Jacksonian epileptic attacks, perhaps confined only to the face or to the arm, by difficulties in motor speech, or by spasticity or weakness in arm or leg, may be due to first, middle meningeal hemorrhage; second, hemorrhage from lacerations of the cortex, third, rupture of small pial vessels, fourth, bleeding from the great sinuses; fifth, localized edema, or sixth, a depressed skull fracture. I know of no way in which localized edema and pressure from a middle meningeal hemorrhage can be definitely differentiated. The absence of a discernable fracture line crossing the middle meningeal artery strongly suggests edema, but on some occasions we have found the middle meningeal artery has been torn close to its exit at the foramen spinosum by a basalar fracture. Such a fracture will rarely show with the X-ray The symptoms of local pressure usually manifest themselves by either weakness, spasticity, or convulsive movements in the face, hand or arm, occasionally in the leg If on the left side of a right-handed individual, motor speech difficulty may be the first manifestation A typical history of such a condition is as follows. Following a trauma the patient may be unconscious from a few minutes to an hour or more, recovery coming on gradually, usually with a period of marked There is then a quiescent period in irritability which all symptoms seem to have practically disappeared. This may last for six or eight hours, then Jacksonian attacks, weakness of the grip, inability to lift the arm, or spasticity, gradually supervene. The reflexes on the side opposite the cortical lesion are usually increased and frequently a positive Babinski reflex is obtained just before or co-existent with these localized pressure manifestations are usually some indications of increased general pressure. The patient becomes more quiet, perhaps semi-comatose, the blood pressure generally mounts slightly, and there is usually steady, progressive, lowering of the pulse and respiratory rates These general pressure symptoms may, on occasions, be markedly delayed, and especially in meningeal hemor-

rhage may come on so insidiously as not to be recognized unless special attention is being di-This delay in general pressure rected to them symptoms with middle meningeal hemorrhage is due to the fact that the blood clot is extradural, the dura acting as a rather firm bulwark protecting the brain. We believe localized pressure symptoms are always an indication for operation at the earliest possible moment. It is surprising how large a blood clot may have formed before giving definite indications of its presence There may be a comparatively narrow margin of safety remaining after the diagnosis has been made. Although small trephine holes along the course of the middle meningeal artery or its branches have usually been advocated, we believe the Cushing subtemporal decompression technique is far more satisfactory. Such a temporal decompression gives the best exposure for the middle meningeal artery and for the removal of blood clots, as well as affording a certain measure of relief of generalized intracranial pressure. Ordinarily the torn artery can either be ligated with fine silk or caught with a Cushing silver clip In the unusual cases where the artery is torn at the foramen spinosum, exposure of the bleeding point is much more difficult. However, with the use of Frazier's lighted retractors and continuous suction the foramen can be exposed even with very free bleeding, the suction removing the blood as fast as it escapes from the artery In these cases we have found the most convenient method of controlling hemorrhage is to plug the foramen spinosum with a wooden peg This can be inserted while the suction tip is close by and allows the foramen to be under observation continuously Hemorrhage from cortical vessels may be controlled by the application of silver clips or a muscle graft. Bleeding from the great sinuses is controlled by ligature or a piece of muscle.

Occasionally local pressure phenomena will be found at operation to be due to a more or less localized edema. This probably represents an area of contusion in which the force applied was not sufficient to cause cortical laceration cannot say whether the intravenous administration of hypertonic solutions would relieve this Inasmuch as it is impossible to rule out hemorrhage as the etiological factor in the pressure manifestations, subtemporal decompression is always indicated. This has proven satisfactory in treating these localized areas of edema, although the return to normal has at times been While this delay may have been due to petechial hemorrhages within the cortex which did not appear on the surface, it seems logical to administer hypertonic solutions when edema has been found

A general increase in intracranial pressure is the most common result of a severe head injury and is the cause, not only of most of the symptoms, but of the largest number of deaths The typical symptoms, when all are present, are so definite that the diagnosis of an increasing intracranial pressure is simple. Because of other injuries which may be coincident with the head iniury certain of the typical symptoms may be masked, or entirely wanting This is particularly noted when severe hemorrhage has taken place, fat embolism has occurred, or the patient for some other reason is in a state of shock We must also remember that although the chief signs are all due to irritation of the medulla, this structure may be more irritated or more severely damaged in one part than another. For example, the vagus center controlling the pulse rate may be simply irritated while the blood pressure center has been The complete picture of severe inparalyzed tercranial pressure may be therefore wanting We believe the diagnosis can be made if any one of the cardinal symptoms is present, even though the associated signs point in an entirely different direction Nothing but pressure on the medulla will give a progressive slowing of the pulse, a rise above normal in the blood pressure, or a slowing and deepening of the respirations. And it is pressure upon the medulla in which we are chiefly interested and to which we particularly direct therapeutic attention

The typical signs and symptoms of rapidly increasing intracranial pressure are drowsiness, progressing to complete coma, a slowing of the pulse rate, in some cases to 40 per minute, or even lower, a slowing of the respiratory rate going in extreme cases just before death to three or four a minute, or a change in the respiratory rhythm with the development of Cheyne-Stokes breathing, a progressive rise in blood pressure, frequently a rise in temperature

These changes may appear within a few minutes, or develop so insidiously as to be overlooked until far advanced It is imperative, therefore, to make frequent, specific observations. As a rule we request a record at 10 minute intervals of the pulse and respiration rates and if the symptoms are at all alarming, blood pressure and temperature readings should be made as frequently question is frequently asked—how much of a reduction in pulse or respiration rates is necessary to make a diagnosis? Of course the probable normal rate for the particular individual must be considered In children the normal pulse rate especially is usually above that of an adult

A reduction in pulse from 70 to 60 per minute makes one immediately suspicious of increasing medullary compression. Anything below this should call for immediate treatment. A reduction in respiratory rate to 15 or 16 per minute is strong presumptive evidence of increased pressure. We should not wait until the pulse registers around 40 and the respirations about 10 or 12 per minute. A rapid lowering of either pulse or respiration rates is even more serious than a gradual fall. Should short periods of rapid pulse or respiration alternate with longer periods of a slow rate, it is a warning of imminent medullary

The temperature should always be taken per rectum, by any other method erroneous opinions will be formed. On several occasions we have seen patients with a mouth temperature of 100° or 101° and a rectal temperature of 106°.

Treatment of increasing intracranial pressure of traumatic origin is by lumbar puncture, subtemporal decompression, administration of hypertonic solutions, and for the coincident hyperthermia, ice packs

We believe lumbar puncture a safe procedure in these cases, in spite of some published opinions to the contrary A lumbar puncture can be performed quickly, easily, and with a minimum upset to the patient. We make a practice of performing lumbar puncture immediately on admission of every patient showing the manifestations of increased intracranial pressure of traumatic There is no rule as to how many cc. of cerebrospinal fluid should be withdrawn fluid should be allowed to escape until it comes drop by drop, ie, until the increase in spinal fluid pressure has been completely reduced times this simple procedure is a definite life saver and at times constitutes the only therapy needed Lumbar puncture can always be performed while preparing for more elaborate therapeutic meas-

There have been many advocates for subtemporal decompression in traumatic cases We believe the only indication for this operation is the presence of localized pressure symptoms as occur from middle meningeal hemorrhage We fully realize that this is contrary to the usual practice, but base our opinion on the far more satisfactory reduction in pressure which can be obtained by the intravenous introduction of hypertonic solu-We have all had the experience after a right subtemporal decompression of finding the pressure symptoms little improved, thereupon performing a left decompression, and in many cases still having alarming pressure symptoms tirely aside from the question of an unnecessary operation, which we feel it really is, there is a definite risk in subjecting such a patient to the added insults of an operation, even though it is performed under local anesthesia. We have had the opportunity on several occasions to observe a definite, rapid, and entirely satisfactory reduction in intracranial pressure by hypertonic solutions in patients unbenefitted by subtemporal decompression performed a short time before

Hypertonic solutions may be administered by oral, rectal, or intravenous routes. The oral or rectal administration of a saturated solution of magnesium sulphate, will frequently relieve severe headache of traumatic origin. The more severe cases are best treated by intravenous salt or glucose solution. A 15 to 35 per cent solution of sodium chloride in amounts ranging from

50 to 100 cc has been rather widely used since Weed and McKibben first demonstrated the action of hypertonic solutions. Because of the experimental evidence of occasional sodium chlorade poisoning we have preferred using a saturated solution of Ringer's formula. For very rapid reduction of intracranial pressure these salt solutions are distinctly indicated. It is seldom, however, that the reduction must be made within a few minutes. For routine use we therefore prefer a 50 per cent solution of glucose, 50 to 100 cc being given, depending upon the individual case.

The glucose solution may be given intravenously as fast as it will flow through the needle. Its action while not as rapid as that of a hypertonic salt solution is much more sustained and there is no subsequent rise to an abnormal level, sometimes noted with the latter. There is also no danger of pulmonary edema following repeated administration, a complication with salt solution naturally to be dreaded. When it seems expedient to use a hypertonic Ringer's or simple sodium chloride solution, this may well be followed in an hour or so by glucose.

The rapidity of improvement in pressure symptoms is often striking. Frequently the pulse and respiration rates show immediate change for the better. Many patients in deep coma can be aroused within a few minutes after this treatment. Hypertonic solutions given intravenously decompress the entire brain while a subtemporal decompression is efficient only over a comparatively small area. The solution can be administered while the patient is still in shock, a noteworthy advantage over any operative procedure. We believe the administration of hypertonic salt and glucose solutions have saved patients otherwise hopeless.

SUMMARY

All compound and all depressed fractures should be operated, the former to prevent infection of bone, meninges, and brain, the latter in order to adequately treat lacerations of the brain immediately beneath.

Local pressure manifestations are a definite indication for operation, Cushing's subtemporal decompression being the procedure of choice

Operation should not be performed for in-

creased intracranial pressure alone

Lumbar puncture is a safe and rapid method for temporarily reducing pressure and should be performed immediately on admission of cases showing pressure symptoms

Hypertonic solutions, preferably saturated Ringer's and 50 per cent glucose administered intravenously, are the most efficient means of reducing increased intracramal pressure of traumatic origin

In closing the discussion of this paper, Dr Peet said

The percentage requiring operation other than

those with depressed or compound fractures is extremely small In our experience hemorrhage is perhaps the most rare of all the complications And in hemorrhage we have practically the only indication for operation Previous to the introduction of Weed's hypertonic solutions all of the cases that showed increased intracranial pressure were of necessity decompressed. It meant that the larger proportion of skull fracture cases were subjected to operation Now with hypertonic solutions introduced intravenously, giving us even better reduction of intra-cranial pressure than is obtained by sub-temporal decompression, the operative treatment has practically gone out of I can not give the actual percentage operated, but it is very small. About once a year we have operated with the idea that we had a middle meningeal hemorrhage and have found localized edema-progressive, localized edema giving a textbook picture of the former condition

We do not operate if we can possibly help it, but the depressed fracture cases do require operation, there is no other way of elevating the skull and no other way of taking care of the traumatized brain. Compound cases require operation to prevent infection. The other cases (and I think they are of the majority) do not require operation.

I would like to add one point which I did not mention this morning, that is, to urge every one to excise all scalp wounds, no matter how trivial, even a small puncture It pays real dividends in the long run You probably see scalp wounds as I have, which were caught together with perhaps two or three gut or horsehair sutures, without debridement, which came to you a week or more afterwards with an infection of the scalp which The actual loss in time took weeks to clear up in hospitalization, in money, in earning power, because the patient was laid up with a comparatively trivial scalp wound is in the sum total, I think, great On the other hand, a scalp laceration properly excised, under local anesthesia, if you prefer, and sutured without drainage will heal by primary union and the man is able to return to work almost immediately

Post-operative Care -First, insist on the patient being kept perfectly quiet. We do not like to use morphine Morphine masks the symptoms Not infrequently a patient will have more or less delay in the onset of his pressure symptoms he is given morphine, it is impossible to say whether the slowing of the pulse and respiration are due to morphine or to increasing intracramal The fundus examination, in my experience, is almost useless for several days may be a little engorgement of the veins in the retina, but we find that so frequently in normal individuals it is impossible to say whether it is an indication of increasing pressure or not. Choked disks occur rarely In addition to the Choked disks occur rarely pulse and respiratory changes we have to depend

upon the mental condition of the patient, his tendency to irritability, and so forth And morphine, of course, affects all signs except the blood

pressure

I prefer very much to give these patients 30 or 60 grams of chloral which will keep most of them quiet We have not used ice caps I suppose theoretically you may reduce brain congestion by the application of ice caps I question how much Sometimes an ice bag, not an actual value it is ice cap, but something that will actually fit comfortably over the forehead will relieve headaches Whether it has any other therapeutic value is questionable

Certainly there is no indication to give 50 per cent glucose intravenously and at the same time try to introduce 1500 cc of saline under the skin I will admit that the saline will be taken up more readily, but we wish to take up fluid from the brain so we will cut down on the fluid intake, perhaps for 24 hours, perhaps for more than that, and rarely do we give subcutaneously fluid to these patients. In mild cases or in those which have largely recovered, but still have severe headache or a rather slow pulse, or a suggestive slow respiration, we sometimes give 50 per cent magnesium sulphate, that is, an ounce and a half or magnesium sulphate and three ounces of water by mouth without any water being taken afterwards. If the patient will not take this by mouth, double the dose, three ounces of magnesium sulphate in six ounces of water is given per rectum This acts more slowly, is not as efficient, but it does reduce the intracranial pressure

If the patient is in deep shock, it is frequently a difficult question to say whether the patient is dying from shock or from intracranial pressure, and whether you should lower the head of the bed or lower the foot I am more apt to compromise and keep it level If I think that shock is predominant, I will elevate the foot a little and if I believe the shock is not quite so serious a matter as the intracranial condition, I will partially elevate the head Certainly, the preferable condition if only the cranial content is to be con-

sidered is marked elevation of the head

The length of disability depends, in my opinion, to a large extent upon the patient's occupation. For example, a student with a skull fracture, who has been unconscious, should not, in my opinion, be allowed to return to school for six He should not engage in any mental occupation which requires concentration course, this is equally applicable to a business or professional man Those patients who return to work shortly, mental work especially, more often develop the symptoms known as traumatic neurosis, chronic headaches, and so forth, which will be taken up by the next speaker. Our opinion is that these individuals should keep quiet for some time, frequently I keep them in bed for a month, even when they are symptomless except for a ten-

dency to dizziness when they sit up I make it a rule to keep them in bed as long as they are dizzy A man who works entirely with his hands, whose brain is considerably at rest, you might say, when he is working is not nearly so likely to develop mental symptoms afterwards I ordinarily reconimend that they keep away from work for at least two months Light work, fussing around the garden or something like that at home is not objectionable, but certainly, heavy lifting or straining work which increases intracranial pressure is harmful

We have all had the experience of finding an injury to the opposite side of the brain not think that it is contrecoup as generally understood, 10, that lines of force are transmitted around the skull and press the skull on the opposite side. I think it is due to the brain being moved within the cranial cavity. The brain is not actually fixed, there is a fluid bed on all sides, and there is no question but the brain can be shoved from one side to the other One very good example of that was published a few years ago in connection with prize fighting. A fighter was knocked out with a blow on the side of the head Several hours later he died The autopsy showed that his brain had been thrust from one side of the head to the other with such force that the curved edge of the falx had cut the brain, in other words, the falx supported the upper part of the brain, but the lower half was moved beneath it

I think the same explanation accounts for a laceration of the cortex sometimes found on the side opposite the initial injury, ie, when a severe blow is delivered on one side of the head, the brain is driven against the skull on the opposite side Unless exposed at operation because of local pressure symptoms the presence of such a laceration would be unknown and probably does occur much more frequently than records indicate.

We have at times found very extensive brain damage on the opposite side Recently I performed a double decompression in such a case. He had had typical symptoms of increased intracranial pressure which came on immediately after Then he cleared up a little, but the his injury pressure symptoms recurred At the time I first saw him he had Jacksonian attacks on one side and extreme weakness on the other I operated on both sides and on both sides he had a lacerated brain with considerable blood clots middle meningeal artery was not torn, although the fracture extended across it The blood clots were from lacerated pial vessels We irrigated and sucked away all clots and broken down tissue and he made a good recovery He would not have been operated on either side if he had not shown localizing symptoms

Although many of our patients probably have some laceration of the brain, at least on one side, the hemorrhage is not sufficient to produce local

manifestations and the edema which undoubtedly occurs from the lacerated brain is removed by our hypertonic solution

We believe that there is really only one indication for repairing skull defects, that is, cosmetre Frankly, I doubt very much the absence of a portion of the skull ever in itself, causes symptoms The one possible exception is the man who has a rather large defect and notices extreme dizziness on bending over and there is visible evidence of change in cerebral pressure when he does so In other words, when he is standing in the upright position there will be a sunken defect and when he bends over herniation occurs of these patients are, undoubtedly, improved by operation The majority, however, desire the repair of the defect for cosmetic reasons or because of their own mental state Some people worry excessively about a defect in their skull I know that the skull is of very little importance, because I have some patients in whom I have literally taken off the whole calvarium I have one patient in whom I removed the entire posterior portion of the occipital bones, including the posterior half of the foramen magnum and well around under the mastoid on each side, all of both parietal bones, all of the frontal bone, except a little above the front sinus, and all of the squamous and part of the petrous portion of one temporal bone Osteomyelitis had started from a chronic otitis media and every bit of bone removed was so diseased that it could not be saved His head is of good shape because the dura was not opened, and except for possible danger of being hit over the head, apparently is all right. I think he is in as good condition as if he had his entire skull

We have had a number of extensive osteomyelitis cases and are convinced that the function of the skull is largely protective. The patient who worries about the defect and especially the patient who is handicapped in business because of a frontal deformity, as the business man, clerk

or salesman, who is conscious of people noticing the defect should be operated. Undoubtedly at times it causes a definite financial loss

During the war several papers appeared advocating cartilage grafts, either placed longitudinally or gridiron fashion And a very beautiful structure can be made from cartilage, but, unfortunately, the cartilage graft is not permanent, but is absorbed On the other hand, a perfectly satisfactory closure of a defect involving, we will say, the larger portion of the frontal bone can be made by taking the outer table from the posterior parie-We make a pattern, either with cloth or rubber dam, of the size and shape of the defect we wish to close and then we turn a scalp flap so that we have simply the skull covered with pericranium Place the pattern, outline it with a knife and then with chisel cut around We make no attempt to have only one piece, but prefer to have the graft made up of multiple shavings covered by pericranium. This offers two advantages There is a much better chance for the new blood supply to grow into the bone and it can be moulded into the desired shape

If some of the pieces break off save them, they are perfectly good Suture the pericranium to that of the skull, preferably before doing this, saucerize the external table, cutting around it 50 the graft will fit nicely By this method we can reconstruct practically the whole frontal region and make a very presentable looking individual This technique was, I believe, first used by Fra-The re-He used it long before the war sults have been very satisfactory Many times if the pericranium is saved when removing a portion of the skull and with care it frequently can be saved, new bone will form. It is generally believed the union between a bone flap and the skull is largely fibrous Sometimes it is Often, however, at a subsequent operation a year and a half afterwards, because of recurrence of symptoms, we find solid bone.

THE RESULTS OF MALARIA TREATMENT OF PARESIS*

(Report of 100 Cases)

By H L LEVIN, M D, BUFFALO, N Y

THE figures given below are taken from the records of the first one hundred cases of general paralysis treated with beingn tertian malaria at the Buffalo State Hospital from August, 1924, to August, 1926 In no one of these cases was there any doubt on the part of the staff as to the diagnosis Each showed sufficient psychotic symptoms, neurological signs and serological findings to clinch the diagnosis There was no particular selection

*Read at the Annual Meeting of the Medical Society of the State of New York, at Niagara Falls, N Y, May 11, 1927

of cases, the only ones excluded were those who were in an extremely weakened condition on admission or who had frequent convulsions Most had previously received some sort of anti-luctic treatment, but it was thought best not to further complicate the picture by any other specific treatment after the course of malaria

For the purpose of this study the cases were divided into the following clinical types (described by Kraepelin and adopted by many American authors)

1—Demented Marked chiefly by indifference, loss of memory and of special abilities, etc

2—Expansive Marked chiefly by euphoria ideas of grandeur, psychomotor pressure, with little loss of memory or orientation

3—Agitated (Galloping or excited) Confusion excitement, extreme restlessness, incoherent delusions

4—Depressed Depressed, manic or involutional symptoms

5—Atypical Praecox like or other irregular type of reaction

In determining the results of treatment the behavioristic factor was held to be the most important criterion, as will be seen from the following definitions

Complete Remissions Ability to sustain self in the community at as high a social and economic level as prior to the onset of psychosis (irrespective of serology)

Partial Remission Ability to sustain self in community, but at a lower social and economic level than prior to the onset of the psy chosis

Improvement — Undoubted and persistent diminution of psychotic symptoms, but still requiring supervision or help, inside or outside of institution

RESULTS OF TREATMENT

Trie of Parens	No	Complete Remission	Partial Rendssion	Improved	Unimprated	Died
Demented	51	6	7	10	13	15
Expansive	19	14	1	1	1	2
Agitated	24	3	2	3	5	11
Depressed	3	2	0	0	0	1
Atypical	3	1	0	0	2	0
_						
Totals	100	26	10	14	21	29

Durations of Complete Remissions—The oldest case has now (May 1, 1927) gone 31 months without any signs of return of mental trouble, the most recent is 4 months. Nine cases have enjoyed complete remissions for 2 years or over; 8 cases one to two years, and 9 cases less than one year

Influence of time on Complete Remissions — Just about one year ago the results of treatment of the first fifty cases was compiled (L Malaria Treatment of General Green Paralysis, New York State Hospital Quarterly, August, 1926) In the preparation of this paper these fifty cases were re-checked and the following changes noted Out of thirteen complete remissions twelve remained so at the end of the second year and one became a partial remission Out of six partial remissions, three remained partial, one became a complete remission, one died and one was placed in the unimproved column as he had suffered a relapse and was returned to the State Hospital Of the eleven in the improved column, three remained there, five died, two were dropped to the unimproved class, and but one bettered himself so that he is now included among the partial remissions. Of thirteen in the unimproved column, eight remained stationary, one made a complete remission, two were moved up from the unimproved to the improved column, and two died

Duration of Psychosis — From the information available it was impossible to gather any worth while figures as to the durations of the syphilitic infections (Many denied any knowledge of primary or secondary lesions) We were, however, able to ascertain in most cases the duration of the psychosis prior to admission, as shown below

Duration	ON OF	Psy	CHOSE	S		
	13 Vos			10 12 Mos		L'n knoren
Complete Remission	11	3	3	2	4	3
Partial Remission	3	2	1	1	3	0
Improved	1	2	0	4	5	2
Unimproved	1	3	2	1	11	3
Died	6	0	0	9	11	3

Ser -The Distribution as to sex is given below

		Complete Remission	Partial Remission	Improted	Unimproved	Died
Male	81	22	10	11	15	23
Female	19	4	0	3	6	6

Serology—Among the complete remissions there was no appreciable improvement in the blood or spinal fluid in fourteen out of the twenty-six The blood Wassermann became negative in three and the spinal fluid Wassermann became negative in only one case The most frequent change was a flattening of the colloidal gold curve This occurred in eleven cases of the twenty-six. In our unimproved group the serology showed no change in twelve out of the twenty-one The colloidal gold curve flattened in eight cases One case in the unimproved group changed to negative Wassermanns of the blood and spinal fluid, but the colloidal gold curve remained practically the same

SUMMARY AND CONCLUSIONS

1 Of one hundred cases of general paralysis treated with malaria, without subsequent antiluctic treatment, twenty-six resulted in complete remissions; ten in partial remissions, fourteen were improved, twenty-one unimproved, and twenty-nine died. A total of 50% were benefited by the treatment. The durations of the complete remissions to date extend from four months to thirty-one months.

2 The grandiose or expansive type of general paralysis offers the best progress, 84% of this variety having definitely improved subsequent to the malaria injections. The prognosis in the demented and the agitated types is much more dubious, the improvement rates being 45% and 33% respectively.

3 The duration of the psychoses prior to treatment bears a distinct relationship to the improvement rate. The best results were obtained with the patients whose psychoses were

less than four months duration Sixty-eight per cent of this group were benefited, as compared to thirty-five per cent with durations of one year or more

4 Males seem to respond to treatment better than do females The total improvement rate of the males was fifty-three per cent, of the fe-

males thirty-six per cent

5 There is no distinct correlation between the clinical and the serological findings subsequent to malaria treatment

SOME IMPORTANT CONSIDERATIONS REGARDING THE INVESTIGATION OF THE UROLOGICAL PATIENT*

By JOSEPH D OLIN, MD, WATERTOWN, N Y

THE purpose of this paper is to stress the need of greater consistency in some features of the handling of our urological ratients

The average patient with urological pathology consults the general practitioner of medicine or surgery first. You will agree, I think, that there is probably no class of the cases which enter their offices in the consideration of which there is more neglect to obtain promptly the readily available clinical facts, and where simple little details of procedure of great diagnostic importance are more often omitted.

The reasons for this common neglect may be many, but, are not hurry and lack of system among the chief? An accurate urological history is not quickly obtained, even when the complaint is urological many facts are not volunteered. It is obvious that facts relating to the sexual life might be difficult to elicit, but even ordinary urinary sumptoms are very incompletely and inaccurately related by the usual patient and must frequently be checked up before recording Urology has its share of troubles in which early symptoms make little impression on the patient. The average man of sixty complaining of frequency or dysuria will give a vague history unless carefully questioned and often will have to be crossquestioned before he will admit a prolonged Cases of urological tuberculosis may volunteer very little which leads to a reason-If a patient is markedly ably early diagnosis toxic or suffering from joint pains he is not apt to associate these symptoms with a slight dysuria or frequency which was present long before

The supplementing then of every patient's volunteered history by a brief catechising on the basis of a dozen well known symptoms relating to pathology of the urinary tract should

be a routine At least the following should be included—frequency, urgency, ardor, tenesmus, dysuria, irregularities of urinary flow (e.g., interruption, weak stream, mis-shapen stream, dribbling), genital symptoms in the male, pain in loins and flanks, and the objective symptoms of pyuria, hematuria (initial, terminal, total), albuminuria, phosphaturia and lithiasis By this categorical questioning an accurate history

may be expedited

We are told that armaments breed wars—at any rate, useful equipment ready at hand is apt to be used when opportunity offers ventures to say the wooden tongue blade has brought more pathology to light than many an elaborate instrument. It is handy and most always at hand If it were not for the general distribution of a simple apparatus for blood specimens, how many more syphilities would be at large in the state The physician approaching a chest automatically reaches for his stethoscope and sphygmomanometer His patient does not look for an x-ray and electocardiograph, but he does expect the doctor to be equipped for the usual routine examination of the lungs, heart and blood vessels should also expect him to be equally prepared to conduct a primary urological examination Luckily the necessary equipment for this purpose is very simple most of it is in the average office What is needed is that it be at handalways set up in a convenient place ready for immediate use-a provision which is commonly neglected in the office of the general practitioner, and not always perfected in that of the surgeon The following articles at least should be thus assembled absorbent cotton, paper napkins, thin rubber finger cots, antiseptic solution, a non-irritating solution for prophylactic injection, a Bunsen burner or alcohol lamp, culture tubes, platinum loop, laboratory slides, several clear glasses for observation of urinary specimens, a bottle of acetic acid, red and blue litmus slips, and the

^{*} Read at the Annual Meeting of the Medical Society of the State of New York, at Nizgara Falls, N Y, May 10, 1927

following sterile articles an assortment of soft rubber catheters, a catheter syringe, gauze sponges, thumb-forceps, olive bougies, wire meatal specula, swabs, water soluble lubricant

With this equipment ready at hand (in the urological corner, as it were), the following procedures should be as much a routine as the palpation of the abdomen, inspection of the fauces, or auscultation of the chest

- 1 Examination of the external male genitalia, including palpation of the testes, epididymes and vasa.
- 2 Inspection of the meatus, male and female
- 3 Smear of any discharge, obtained by milking of urethra where indicated
- 4 Observation of the underclothing for stains of discharge or urine.
- 5 Observation of the act of micturition of the male while the urine is voided in at least two clear glasses successively
- 6 Immediate inspection of the urine in two clear glasses as voided (first and second portions) by strong transmitted light, patient still retaining some urine in his bladder where feasible
- 7 Digital examination of the prostate and vesicles (where the latter may be reached) Stripping and obtaining of the secretions, either direct or in a third voiding of urine, for microscopic examination

Note Specific instructions should be given when the appointment for first consultation is made that the patient void as long before the appointment as his usual interval and not later People generally should be informed of this requisite, when coming to a doctor's office for their first consultation

- 8 Gentle, aseptic exploration of the anterior urethra of the male when any urological symptoms are present (in the absence of any contra-indication, such as acute urethritis) not using a sound but the largest bougie which can be readily popped through the meatus
- 9 The aseptic catheterization of all female patients, adults or children, when the character of the voided specimen so indicates, including culture where indicated

10 The aseptic catheterization of all patients male or female, when urmary infection is present and there is no contraindication, to determine the possibility or amount of retention

Simple procedures, familiar to us all, their performance certainly requires no specialist, but how often is one or more of them neglected because the time is short and the equipment not ready. A digital rectal examination ceases to be dangerous or repulsive if protection of the hand by a finger cot and a whisp of cotton or strip of paper napkin is

readily provided With sterile catheters, lubricant, and thumb-forceps ready, it takes but a moment to ascertain in an aseptic manner whether a prostatic has a retention, but if one has to look about for these things, to scrub, to wait and boil up catheters, etc—how much oftener will the examination be postponed and the information lagging or lost (Satisfactory work here as in the whole field of clinical effort in the office is facilitated by the practice of hours by appointment, an arrangement which relieves the doctor from much strain, adds to his scientific interest and initiative and gives his patient the benefit)

Among common misconceptions which some of us who are attempting urological diagnosis recognize as impediments still to be reckoned with, I may be pardoned for rehearsing the following

That recurring urological symptoms if slight are therefore unimportant. Is it not true that frequency, the commonest urological symptom, is still far too apt to remain unexplained till too late to overcome its cause?

That hemorrhage from the urmary tract which has ceased does not need investigation—forgetting that cessation of the symptom does not assure absence of its cause

That pyuria is always present in urological infections—Yet it is common knowledge that bacterial invasion does not always produce pus

That if the disease is in the kidney the urine specimen must contain casts—elements conspicuous by their scarceness in renal infections

That a clear, negative urine means there is no urological pathology—A hypnotic for the doctor who needs a stimulant instead

That urologic affections are rare in child-

hood -Rather say "less obvious"

That the cystoscopic examination of a child is a very difficult procedure, requiring a general anæsthetic in girls as well as boys—Special instruments make the cystoscopy of the little child a very practicable thing, and many children bear it well under the same conditions as their elders

That a prostate that is apparently not enlarged to rectal feel is therefore not obstructing. Though it's the urethra, not the rectum that is in trouble

That a prostate that is apparently normal in size and consistency as felt by rectum, and not unduly tender, is therefore free from infection—Who will assure us that a tonsil is not infected by the feel of it?

That cystitis is still an adequate diagnosis—We may hope it is, but we know it isn't

That stricture of the urethra is confined to the male—Merely comparatively rare in the female

That protraction of a urethritis beyond eight

weeks does not demand thorough investigation—It's earlier investigation would certainly spare the patient some misery—and cut down some professional incomes

That the acceptance of a fair sized sound by the male urethra proves there is no stricture—We know the sound is designed for treatment and yet some of us persist in preferring it in diagnosis.

That non-venereal stricture of the male urethra is rare—Though the urethra may have been strictured before it became infected

That abdominal, loin or pelvic pain not definitely accounted for outside of the urinary tract may be allowed to ride, or exploratory laparotomy be done without as full a urological investigation as needed to prove or disprove disease of this tract as its cause

These are recited because one is convinced from experience that they are still common enough and sufficiently substantial to cause the mishandling of many a patient. A tactful word let drop by the surgeon in consultation may perform a real service of enlightenment in this regard

I wish to speak of some circumstances in the hospital observation of the urologic features of our patients which may give wrong impressions

Foul urinals may inoculate urine specimens and delay in a warm temperature incubate them so that the laboratory finds them abounding in bacteria. Though there is no excuse for this condition, it can easily obtain Every specimen (not only the catheterized ones) should be kept fresh till examined. This requires supervision, but if we demand it the hospitals will furnish it

I believe most urinary chart blanks fail to provide for a lucid picture of the condition of the submitted specimen Here again simple things are neglected. An examination of 40 urinalysis chart sheets from all over the state shows that only 17 of them have space allowed for general description of the specimen other than color, and in only four is there provision for recording the character and quantity of the sediment. The writer feels that the technician should receive her specimens fresh and should be taught to describe the urine as it appears when viewed after agitation in a clear glass by transmitted light, and also to record the character and quantity of sediment I have heard of no practical, accurate way of telling the amount of pus in a specimen by microscopic examination One might dilute the specimen to a given density—thoroughly agitate it for a long period and count the leukocytes in a given volume, but it wouldn't be worth while for routine work However. it does mean much more to some of us that a urine is described as muddy and having a

heavy yellow sediment, than that a mere microscopic finding of leukocytes 10+ is reported. In a freshly voided sample with bacteria and no pus noted in the microscopic report, it would be interesting to know whether the fresh urine appeared very hazy or slightly so or practically clear. The proportion of blood to pus as shown in the layers of centrifuged sediment makes an interesting comparison to the microscopic findings. There should be space enough to record the appearance of shreds, scales, blood clots, etc.

If separate items are provided for under Microscopic Findings, the list of items, it would seem, should be complete, or blank space left for others. Out of 25 charts with blanks for microscopic items, in 11 space for bacteria was omitted, probably because the laboratories are accustomed to receiving con-

taminated bacteria-laden specimens

The nurse too, should be taught the importance of a close watch of the character of the urine of her patients. She should know that a specimen of urine can not be properly observed in the bed pan or pus basin. She should be drilled in the proper method of observing the urine and should record an intelligent description of one or more specimens of each patient in her bedside observations daily. It is much more important to teach our nurses this than to teach them chemical and microscopic urinalysis.

The improvement of technic and the selection of better filling solutions for radiographic study have obviated much of the disturbances resulting from special urological Cystoscopic procedures are, investigation however, not without their reactions surgeons recognize the prerogative of the urologist to examine his referred cases according to his judgment Many of them should be observed for some time before cystoscopy, if indeed they should be cystoscoped most, the object of cystoscopy is best attained when the diagnostic data otherwise obtainable have been assembled first The surgeon should surely not expect a cystoscopic examination while the tissues are suffering from recent It is often traumatism of instrumentation advantageous to collect segregated specimens, do differential function and pyeloureterogram at one seance, while in other cases, the first cystoscopy must be brief and limited to segregation or merely observation of the bladder I mention this because the natural desire to cut down the hospital residence sometimes tends to too precipitate action

Consideration of making the diagnosis safe leads to that of another diagnostic procedure, the obtaining of catheterized specimens in our hospitals. The replies received from the nursing departments of 50 hospitals of our state

show that in almost all scrubbing is required for catheterization by the nurse. In one ten minutes scrubbing is specified, in another eight, some scrub twice, some technics even call for an assistant, nine specify gloves, about half still permit the use of glass catheters, with exceptions, a few use metal catheters, some use no lubricant, even on rubber catheters most the technic is time consuming, in many fussy In some the patient is all but treated to a general bath Diagnosis might be facilitated by the popularization of a simpler technic A proper method of catheterization for hospital use should accomplish the obtaining of an uncontaminated specimen by a process which does not frighten nor hurt the patient more than necessary, does not result in infection and which is accomplished in a reasonable time and with reasonable expense and effort I believe that the process of scrubbing and wearing gloves involves unnecessary effort, time and expense, and that draping the patient with extra sheets, the use of stockings, etc, is not only needlessly expensive and burdensome, but that such elaborate preparation tends to frighten the patient—and that the ablutions as directed in some technics tend more to infection than asepsis

One feels that the following procedure, given here in essence, fills the requirements labia are held apart and the meatus identified, by upward traction if necessary The area is sponged (not laved) with two or three absorbent gauze sponges (not cotton balls) in succession, the sponges being caught by the corners and the middle of the sponge moistened in the solution so as not to wet the nurse's fingers, but make moist contact with the patient The last sponge used is left in place for a moment while a sterile soft rubber female catheter, velvet eyed and with smooth surface is grasped with sterile forceps and lubricated with an aseptic, water-soluble, nonirritating lubricant and left sterile, and within The labia are held apart again easy reach with the thumb and forefinger of the left hand, the sponge removed, and the catheter grasped again by the forceps (held thumb up) at an angle acute to the catheter, about 134 inch in from the tip and introduced gently and slowly, with the eye up

With this technic scrubbing is unnecessary, washing of the hands is sufficient. No assistant is required, no prolonged mysterious preparation has frightened the patient. The method is as aseptic as one can devise. Traumatism is minimized by the use of a well lubricated, smooth, soft rubber catheter. The nurse can introduce it every whit as gently with the forceps as with her fingers, and can see better what she is doing

In the catheterization of the male patient, whether by intern or orderly, a forceps technic is advisable when soft rubber catheters are used

The objection that one cannot be as gentle with forceps and that the sense of resistance is not so acute is, I believe, not well taken. The right instrument must be provided. The spring must not be so stiff as to require any effort to bring the points together. The forceps must be held thumb up, so that the movement of insertion will be from the wrist, not from the arm. It would seem that the more a nurse or physician learns to handle sterilized things with sterilized forceps, when practicable, the better for the patient.

To Summarize The writer feels that the patient is entitled to an earlier urological diagnosis Anamnesis of urologic troubles is apt to be insufficient or inaccurate, and some pains must be taken to get a correct history at the first consultation The habit of categorical questioning based on significant urological symptoms will further this The simple equipment required must be ready at hand to facilitate a prompt, thorough preliminary urological examination by the general practitioner of medicine or surgery. Many common fallacies must be discarded by the profession if the urological patient is to get a fair When referred for examination, the procedure must be left to the consultant Improvements might be made in the handling of urmary specimens in our hospitals as well as in the hospital urinary chart blank, in order to greater accuracy and lucidity It is suggested that a simple forceps technic of catheterization with lubricated soft rubber catheter might with benefit be substituted for the usual ones in vogue in the hospitals of our state

URINARY DISTURBANCES IN WOMEN A STUDY OF 700 CONSECUTIVE CASES*

By FREDERICK T LAU, MD, FACS, AND JOHN K DE VRIES, MD
From the Urological Department, New York Hospital (James Buchanan Brady Foundation)

THIS study is prompted by a realization of the marked relationship between gynecology and urology in the female and the large number of female patients presenting

following one or more laparotomies without relief of symptoms. The cases are divided into two groups. (a) those seen in the out-patient department and (b) those admitted to the hospital for treatment and operation. Obviously,

themselves with pathology of the urinary tract

^{*} Read at the Annual meeting of the Medical Society of the State of New York, at Niagara Falls, N Y May 11, 1927

weeks does not demand thorough investigation —It's earlier investigation would certainly spare the patient some misery—and cut down some professional incomes

In the catheterization of the male patient, whether by intern or orderly, a forceps technic is advisable when soft rubber catheters are used

The objection that one cannot be as gentle with forceps and that the sense of resistance is not so acute is, I believe, not well taken The right instrument must be provided. The spring must not be so stiff as to require any effort to bring the points together. The forceps must be held thumb up, so that the movement of insertion will be from the wrist, not from the arm. It would seem that the more a nurse or physician learns to handle sterilized things with sterilized forceps, when practicable, the better for the patient.

To Summarise. The writer feels that the patient is entitled to an earlier urological diagnosis. Anamnesis of urologic troubles is apt to be insufficient or inaccurate, and some pains must be taken to get a correct history at the first consultation. The habit of categorical questioning based on significant urological symptoms will further this The simple equipment required must be ready at hand to facilitate a prompt, thorough preliminary urological examination by the general practitioner of medicine or surgery Many common fallacies must be discarded by the profession if the urological patient is to get a fair When referred for examination, the procedure must be left to the consultant. Improvements might be made in the handling of urinary specimens in our hospitals as well as in the hospital urmary chart blank, in order to greater accuracy and lucidity It is suggested that a simple forceps technic of catheterization with lubricated soft rubber catheter might with benefit be substituted for the usual ones in vogue in the hospitals of our state

URINARY DISTURBANCES IN WOMEN A STUDY OF 700 CONSECUTIVE CASES*

By FREDERICK T LAU, MD, FA.CS, AND JOHN K DE VRIES, MD
From the Urological Department New York Hospital (James Buchanan Brady Foundation)

THIS study is prompted by a realization of the marked relationship between gynecology and urology in the female and the large number of female patients presenting

* Read at the Annual meeting of the Medical Society of the State of New York at Niagara Falls, N Y May 11, 1927

themselves with pathology of the urinary tract following one or more laparotomies without relief of symptoms. The cases are divided into two groups:

(a) those seen in the out-patient department and (b) those admitted to the hospital for treatment and operation. Obviously,

a number of patients in the first group are included in the second and a number of patients admitted to the hospital were not seen in the out patient department.

in the out-patient department

Those on whom complete urological examinations were done, were subjected to urinalysis, urethroscopy, cystoscopy and pyelography and ureterography on the side indicated and on the opposite side at a later date if necessary Cystograms by the Herbst¹ method were done when indicated Sterile specimens were collected from the bladder and both kidneys for culture and from both kidneys for urea and microscopic examination as well as guinea pig inoculation Bilateral phthalein estimations were done and pyelograms taken with the patient in the prone posture terograms were taken with the patient in the erect posture, the lead catheter being withdrawn and being at the ureteral orifice as the picture was taken Operative cases were more thoroughly investigated with blood chemistry and other laboratory work

Diagnostic investigation is obviously secondary to palliative treatment in patients presenting acute physical discomfort. The percentage of cases presenting simple pathology as caruncle or stricture of the urethra, trigonitis and bullous edema and cystic degeneration of the bladder and bladder neck is extremely large. Most of these cases respond very satisfactorily to treatment indicated although trigonitis and bullous edema are often most resistant and cause discouragement to the patient and urolo-

gist

Before proceeding to a study of the cases, a few words will not be remiss on the direct influence of gynecological conditions on the several cardinal urological symptoms. Hematuria is frequently the result of lesions in the female genitalia. Frequency is often traced to some injury to the vesicle sphincter caused by

child birth or by cystocele

In a general consideration of urmary infection, it should be determined whether the infection is ascending or descending and whether the urine is acid or alkaline Renal tuberculosis is often characterized by acid urine and The removal of foci of a negative culture infection is imperative in hematogenous or descending types of infection Intravenous medication of infection is often accompanied by extreme toxicity and should be used conserv-I have had excellent results with atively intravenous mercurochrome in several cases in which general infection was present Ammonium Chloride (1 gram T I D) and Sodium Benzoate, grs XV tid increase normal acidity of the urine and will change the reaction in alkaline cystitis

Table 1 is a tabulation of the diagnostic findings in out-patients. As a more exhaustive

study can be made of operative cases from their ward records, only non-operative cases will be discussed on this table Polycystic

kidneys are always bilateral and are non-operaative cases Rovsing has suggested the relief of tension by puncturing the cysts, but the advantage of this precedure is questionable. These cases are best treated by forced fluids and attention to the co-incident nephritis

Anomalies of the kidney may be ignored unless they interfere with function or produce stasis with co-incident infection in which case

surgical relief is necessary

Silent stones or those producing no symptoms, if there be no interference with function may be allowed to remain and kept under observation. Attempt should be made to cause the passage of small smooth stones in the kidney pelvis by intraureteral manipulation. Great progress has been made in recent years in this technic

Hydronephrosis and pyonephrosis are the results of stasis and infection respectively or combined These conditions, as well as pyelonephritis reduce kidney function and frequently progress to the destruction of tissue in the kidney proper The increase of kidney function and reduction or elimination of infection by intelligent dilatation of the ureter and drainage and lavage of the kidney pelvis is most marked Nephrectomy is the only means of relief in some cases of pyonephrosis and pyelonephritis in which there is persistent infection which cannot be drained, abscess cavities not draining into the pelvis and a very low or absent function, although many of these cases can be markedly improved or cleared up by conservative procedure

The improvement and cure of pyelitis by pelvic lavage at intervals of one or two weeks may be determined by repeated cultures of urine from the side involved. The best results have been obtained by us with acriflavine solution. In pyelitis of pregnancy there should be a minimum of instrumentation. In severe cases very satisfactory drainage is obtained by allowing a catheter to remain in place to the kidney pelvis indefinitely.

Strictures of the ureter vary in caliber and

location although they occur most frequently in the lower third in the broad ligament portion and along the pelvic wall at the bifurcation of the internal iliac artery The congestion of pelvic vessels co-incident with menstruation is frequently transmitted through the adjacent lymphatics and vessels to the ureter at the site of stricture, thus producing further constric-The resulting ureteral colic may aggravate a dysmenorrhea or be mistaken for the Those strictures caused by descending hematogenous infections should have investigation done to determine and eliminate causitive foci in teeth, tonsils, sinuses, etc patients are entirely relieved of recurrent attacks of typical renal colic by the ureteral dilatation co-incident with catheterizing ureters in a routine urological examination

One of the ureteroceles in this series was of the intravesical type which filled with each efflux of urine and the other was of the extravesical type. The anomalies of the ureteral orifices were all the result of constrictions at these sites. They were treated by (1) incision and (2) fulguration through an operating cystoscope. Hydro-ureter like hydronephrosis is the result of stasis. The amount of ureteral dilatation necessary to be termed hydro-ureter is a question of individual interpretation. The three cases in this series were of the very marked type—one a tuberculous ureter.

Cystic degeneration of the bladder neck and of the bladder mucosa just internal to the bladder neck has been observed in a great many of these cases This condition is interpreted as the aftermath of an old infectious or inflammatory process. Not a few of these patients had been subjected previously to complete urological examinations without definite findings or relief of symptoms We have treated them with topical applications of Silver-Nitrate 25 per cent, Phenol and Glycerine (equal parts) and fulguration The most satisfactory results have been obtained with the latter method Fulguration has also been used with good results in bullous edema of the bladder neck

Female cystitis is largely of bacterial origin The most common complication is urethral stricture which is found more often in the outer portion near or at the meatus. The diagnosis may be made from the history, physical examination and urinalysis The reaction of the urine should be changed as soon as diagnosis is made. Autogenous and stock vaccines have not been used in this series although brilhant results have been reported by others After the acute symptoms subside, if bacteria are still present or if abnormal elements are still present in the urine, a complete urological chamination should be done. While cystitis per se, can exist, we should not be content

without a thorough search for causitive factors

Cystitis cystica in this group is the term used to designate cystic degeneration in the bladder in a location other than the vesical neck or trigonum

The condition of the co	C 1

The ova of Schistosoma Billharzia was found in the urine of one Italian patient presenting lesions in the bladder only

Glandular hypertrophy on the urethral floor at the bladder neck corresponding to Albarans glands in the male has been observed in three cases This condition, as well as contracture

of the bladder neck, has been treated by endothermy desiccation

Caruncle of the urethra is seldom noticed in patients under forty years of age. This condition is very common and responds best to fulguration. In one patient over eighty years of age in this series, a cystocele of extreme degree was present as well as a caruncle 2 cms in diameter which appeared as a ball valve at the urinary meatus. The gynecologists felt that the patient was too senile for surgical relief of the cystocele so we decided to try fulguration rather than excision of the caruncle. This proved most satisfactory and subsequent caruncles have been treated only by fulguration.

Stricture of the urethra has been mentioned previously. This condition is quite common and improvement is rapid following dilatation and irrigation of the urethra and bladder if infection be present. Prolapse of the urethra is due to a general lowering of muscular tonicity and is not uncommonly observed in multipara.

The majority of cases classified as incomplete were those whose attendance at the clinic did not continue for a long enough period to permit complete examination or diagnosis

Table 2 is a tabulation of diagnostic findings in patients admitted to the hospital. It is an interesting observation that eleven of these patients or slightly more than 5 per cent had gynecological conditions but had come to our department because of urinary symptoms. They were all referred to the Gynecological Department as were a great many cases in the out-patient department.

The prognosis in Hypernephroma is dependent upon the speed with which diagnosis is made and the kidney removed. A great increase in the respect for hematuria, particularly of the painless and intermittent type has devel-

oped in the last decade Complete investigation is promptly indicated when this condition is present. One patient, in this series, seen in the out-patient department, presented a history of hematuria, at first painless of long indefinite duration A pyelogram of the functionless involved side showed a tumor obliterating part of one calyx The extreme debility of the patient and a function of 3 per cent from the other kidney contraindicated operation was transfused and attempts to improve her condition generally were made seen-four months later, the function of the opposite kidney was not improved and the kidney shadow had doubled in size with complete it will be found that the thickened inelastic sub-mucosa has split at certain places over the involved areas. Such ulcers, however, heal fairly rapidly, and one may be surprised by their disappearance, all symptoms persisting as before. If secondary infection has occurred, the other changes of bacterial cystitis may be superimposed.

Traumatic cystitis and extravesical pressure are frequent complications of child birth, misplaced or inflamed organs of the female genitalia, or tumor growths in the latter Extravesical pressure with co-incident discomfort was noted in some of these cases from a ring

pessary.

obliteration of calyces and a large portion of the kidney pelvis. The operations in this short series were performed under Para-Vertebral anaesthesia. Regional anaesthesia has taken a very important place in urological surgery. Hemorrhage is decreased because the blood pressure is not elevated and anaesthesia is prolonged for six or seven hours, covering the greatest period of post operative shock

Incrusted cystitis is characterized by alkaline deposits on the bladder mucosa. Hager³ has isolated an organism known as Proteus Ammonia which converts urea into ammonia. The resulting alkalinity precipitates alkaline inorganic salts which are deposited on some already inflamed area of the bladder mucosa or on some tumorous lesion. We have been unable to obtain the satisfactory results reported by a few others in the use of Bulgarian bacillus solution in these cases.

Interstitial or sub-mucous cystitis is that type described by Young* in which initial cystoscopic findings are negative. A forcible distension of the bladder produces irregular areas of localized reddening and edema with perhaps some ecchymotic spots. After the distension,

Calculi in the kidney or kidney pelvis are best removed, if possible, through an incision on the posterior surface of the pelvis is less destruction of tissue and less possibility post-operative hemorrhage with technic than with nephrotomy The kidney should be tapped gently with the finger tips to insure dislodgement of adherent particles and the pelvis and calyces should be lavaged with saline solution A fluroscopic examination or a picture on a small X-ray film while the kidney is delivered on the loin will insure against any remaining particles. It is our custom to put a No 20 F soft rubber catheter down into the pelvis when closing the wound and remove this gradually beginning on the fourth post-operative day. In a study made some time ago by ones of us, it was found that all cases of recurrent calcult were accompanied by stasis and infection The elimination of these two elements is an imperative procedure. It will be observed that six of the cases in this series or 2 per cent had previous abdominal operations without relief

In tuberculosis of the urinary tract in general, conservative opinion today is not so in-

^{**}Right Costo = Vertebral Angle.

sistent as formerly on radical surgical removal of organs or parts involved. A definite tuberculous involvement of a kidney with reduced function, abscess formation or destruction of kidney tissue as well as involvement of the ureter is entitled to nephrectomy and ureterectomy If the major focus be eliminated, the secondarily involved areas will respond to general and local treatment Tuberculous bladder ulcerations caused by descending infection respond very promptly to fulguration and topical application following the removal of the kidney and involved ureter When the ureter is not involved, nephrectomy is sufficient. I was very much embarrassed, some time ago, to receive the pathologist's report finding no tuberculosis in a kidney which I removed from one of the cases in this series-an eighteen year old girl The guinea pig report had been positive from this side and there was a suggestion of pyelographic shagginess in the up-It would seem that the amount of decrease in function in the involved kidney should be considered to a large extent in deciding the advisability of nephrectomy

Another patient in this series—a woman fifty years old, refused operation, despite a

3 Ureth

positive guinea pig finding and a slight shagginess of one of the calyces She was referred to the Urological Tuberculosis clinic which was established several years ago in our departat New York Hospital Nine women have been referred to this clinic from the Female Of these nine cases, one was ill with inoperable renal tuberculosis, another was the case just cited and six were post-operative nephrectomies for renal tuberculosis. Five of the six post-operative cases had tuberculous These are all receiving general and special treatment which consists of rest, fresh air, diet, and Koch's Old Tuberculin in graduated dosage. They also receive both air cooled and water cooled mercury vapor quartz lamp The cystitis patients are given treatment methylene blue to relieve the burning on urination, also other bladder sedatives as required All of them are doing well especially the two non-operative cases who have gained weight and have had alleviation of their symptoms There are two post-operative patients in this clinic merely with the idea of building up their general health as they have no symptoms

You will notice that the average age incidence in this series as in the other series is an

interesting observation. The number of sites of pain in these cases obviously exceeded the number of patients. I am sorry that space does not permit the tabulation of the respective locations of pain in each individual patient. There seems to be an equal involvement of the respective kidneys in renal tuberculosis. This has not been so in the other pathological conditions in this series.

Pyonephrosis, hydronephrosis and pyelitis have already been discussed. The number of

ureteral strictures and kinks complicating the hydronephroses is not so high as one might expect. Most of the cases of hydronephrosis and pyelitis were, admitted to the hospital for twenty-four hours following routine urological examinations or for dilatation and lavage.

The pendulum of popular opinion on the advisability of nephropery in the treatment of nephroptoses has swing back and forth several times. The enthusiasm for this operation reached

its height at the time Kelly and Edebohls were reporting their brilliant results a decade ago. It is reasonable to assume that a patient with bi-lateral nephroptosis must have some ptosis of the entire abdominal content and a nephropexy will not give relief of symptoms However, when the condition is unilateral, particularly when complicated with kink or torsion in the ureter. I believe that nephropexy may be done to advantage if improvement has not been obtained by elevation of the kidney with a belt, dilatation of the constricted ureter and lavage of the Eight nephropexies in this infected pelvis total series of fifty-one cases—seventeen per cent—is evidence of the satisfactory results obtained by using the elevating belt, combined with dilatation and lavage. The extreme majority of right sided involvement and the occurrence of five or thirty-one per cent of these cases giving a history of previous abdominal

operations without relief is worthy of com-

Ureteral calculi and strictures of the ureter have been discussed under non-operative pro-Please note that five ureterotomies were done on a total of twenty-one cases in the Practically all of these were entire series cases of rough stones impacted in the natural narrowing in the lower third or in strictures of the ureter

In Table 11 the minor details of histories are incomplete in a number of cases because they were admitted only for routine examination or for a short period following dilatation and lavage Please note the great majority of right sided involvement and the fact that seven or thirty per cent of these cases had from one to four previous abdominal operations without relief of symptoms

Time will not permit an extensive discussion

of healthy tissue is present around the tumor, resection is perhaps the most satisfactory method If extravasation is present, and the surface of the tumor is elevated, the logical procedure is to apply the actual cautery or endothermy and bring the tumor down to the level of the surrounding bladder mucosa When this is accomplished, radium emanation is employed by the implantation of platinum seeds We are not experiencing today the painful sloughing and slowly-healing ulcerations which occurred with early radium therapy The screening of radium by platinum, filters out the irritating alpha and beta rays which formerly caused the sloughing and ulceration and permits a uniform exposure of the tumor to the gamma rays The average age of patients in this series—fifty-nine—is the same as There was a total of four cases, the average age was thirty-three years and resection of the ulcer was done in three cases One of these had a co-incident complication of carcinoma of the rectum She was transferred to Memorial Hospital and lived for nine months This so-called elusive ulcer first described by Hunner is much more frequent in women than in men and is not particularly common—eight in this entire series. Frequency and dysuria were present in each case and were more marked at the time of the menstrual period Pain was reported in various places but most frequently in the bladder region. Our method of treatment has been to use fulguration with local, regional or general anaesthesia and if this does not produce a cure, to proceed with resection of the ulcer Sufficient time has not

SUMMARY

- (1) Many urinary disturbances in women are caused by minor pathological conditions in the urethra or bladder neck
- (2) Gynecological complications are very frequent in urinary disturbances in the female
- (3) Many urinary complaints in women are the result of gynecological pathology and will disappear on eliminating the same
- (4) Many pains occurring in the intra-peritoneal area are referred from the kidneys and many pains in the back are referred from conditions in the pelvis or in the peritoneal cavity in general
- (5) Many needless laporotomies are done because the urinary tract is not previously investigated
 - (6) In this series, the greatest number of

operations without relief caused by mistaken interpretation of pain symptoms was in the series dealing with renal calculus, nephroptosis and stricture of the ureter

(7) Urological diagnosis is on such an efficient basis that complete examination will demonstrate existing pathology in the urinary tract

THE SURGICAL TREATMENT OF PULMONARY TUBERCULOSIS*

By E W PHILLIPS, MD, ROCHESTER, N Y

WO years ago, Willy Meyer wrote "Advanced Pulmonary Tuberculosis—a Borderline Disease" Pulmonary Tuberculosis is a borderline disease—from its incipiency to the advanced forms—close co-operation, between physician and surgeon, and the proper selection of treatment is essential for the best care of the patient "Surgical Aids in the Treatment of Pulmonary Tuberculosis" is a more appropriate title for this paper

Historical—As far back as 1821, James Carson recommended artificial pneumothorax in the treatment of pulmonary tuberculosis and proved, by experimentation, that it was practical How-

* Read before the Eighth District Branch Medical Society, at Warsaw, N Y

ever, a lapse of several decades followed before Murphy, in this country, and Forlamin, in Italy—independent of each other—recommended and practiced artificial pneumothorax. Chest wall collapsing operations began in 1907, when Brauer advised more extensive operations than had been performed. Friedrich carried out the operation Various surgeons modified operative technique until Sauerbruch's posterior paravertebral thoracoplasty came to be adopted as the standard operation. Today it is the most common type of cliest collapsing operation but there are constantly appearing, in the literature, modifications, some as slight changes—others radical

Paralysis of the diaphragm, by blocking impulses in the cervical portion of the phrenic nerve,

was first reported by Stuertz in 1911 but, apparently—independent of this work—Sauerbruch and Schelepman conceived and put into practice the same idea

The Rationale of the Surgical Aids—It is necessary to understand the normal physiology of the cliest and the pathological picture of tuberculosis in the lung, before one can comprehend the indications for using a particular surgical aid in a certain type of lesion

There is a marked variation in the individual powers of resistance in the battle between the host and the tubercle bacillus. It varies from disease that progresses in spite of the best of treatment to disease that will recover no matter how badly treated or without any treatment. Therapy, in tuberculosis, is directed mainly to the great majority who he between these two extremes.

Parenchymal lesions heal in different wavs. There may be recovery with almost no fibrosis or there may be extremely marked fibrosis. The aim in treatment is to secure healing of the lesion with as little fibrosis and scarring as possible, because fibrosis results in lowering of the vital capacity and consequent crippling of the individual Vital capacity depends upon an intact breathing unit which includes an unimpaired pulmonary elasticity. Fibrosis destroys normal pulmonary elasticity

Yates believes that the quality and quantity of blood delivered to the diseased lung largely determines the type of healing and has shown that the greatest amount of blood is in the pulmonary capillaries, delivered by the least amount of cardiac effort when the capillaries are not either elongated—as in full inflation—nor tortuous—as in deflation. This state is the mean between full inflation and full deflation and can be approached when the diaphragm assumes the expiratory position, following induced paralysis.

Rest, in general, and for the diseased part, is accepted as proper treatment of tuberculosis diseased lung that is functioning with each respiration is not at rest. Inspiration in ordinary quiet respiration is carried out mainly by descent of the diaphragm. Nature so generously supplied man with lung tissue that the tidal air of each respiration is only a fraction of the vital Patients, following unilateral paralysis capacity of the diaphragm, do not complain of respiratory Consequently, compensation must be the result of involuntary increase in the activity of the opposite side. Were this not so, the calling into action of the accessory muscles of respiration would cause subjective symptoms The importance of the diaphragm in quiet respiration can be appreciated when one has seen a patient following bilateral, simultaneous paralysis of the diaphragm There is immediate, acute respiratory distress but compensation, of which the patient

is acutely conscious, is possible through action of the accessory muscles

We have shown that an increased blood supply to the diseased lung, and rest, can be given by a simple operation that causes paralysis of the diaphragm. When a diaphragm has been paralyzed by phrenectomy, it immediately assumes the high expiratory position and is motionless or it may have a slight paradoxical movement, as a result of variations in intra-abdominal pressure. The lung volume on the affected side is reduced by one-fourth to one-third, this alteration of the intrathoracic tension permits retraction of fibrous tissue and obliteration of intrapulmonary cavities.

Yates emphasizes that the quality of the blood delivered to the diseased lung must be good Every means of improving the blood should be employed fresh air, bodily rest, proper nourishment, heliotherapy and, when indicated, blood transfusion of whole, unmodified blood. The best donor is one who is not susceptible to the disease—one who has recovered. Preferably, the donor should be an adult which practically insures—if he is well—that his blood has had a successful combat with the tubercle bacillus.

When irreparable damage to pulmonary parenchyma has taken place, with marked fibrosis and cavitation, healing, with a return to normal, is impossible and we must satisfy ourselves with arrest of the disease. The result will be a permanently crippled individual insofar as his vital capacity is concerned. It is in this type of case that chest collapsing operations are required—to cause obliteration of cavities and to permanently put the diseased lung out of function.

Indications and Contraindications for Surgical Aid —In general, disease that is progressing and shows no tendency to heal under medical treatment, demands the careful consideration of surgical aid

Again quoting Yates, "We must get away from the old precedent of early expectant treatment until patients have demonstrated their incapacity to recover." Then they may be so far advanced that other treatment will be of no value or will only allow healing with permanent crippling.

Disease limited to one lung is not common. This would be the ideal condition to treat. A little too much disease in the good lung has frequently been the cause of disaster due to progression of the lesion, when more work was thrown upon the good side. If disease in the good lung exists, it must not be acute and progressing. Old, hard lesions in the upper lobe are not contraindications to surgery. Any sign of activity in the good base is an absolute contraindication.

Serious impairment of other organs, as heart and kidneys, constitutes a contraindication to major surgery Indications for Phrenectomy —(1) As a supplement to artificial pneumothorax

It has been used extensively by Goetze, who believes all cases treated by pneumothorax should have phrenectomy, as there will be less lung expansion and less work for the diseased lung

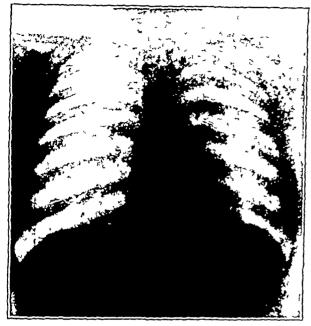

Figure 1 Case 1
Female Age 18 Duration of pulmonary tuberculosis, 1 year Weight 110 Temperature 101-103 Sputum 4 oz

when, after the period of compression, the lung is finally allowed to expand. It will increase the interval between refills during the course of artificial pneumothorax treatment and will frequently prevent the reactions that sometime accompany refills. There is less liklihood of effusion complicating artificial pneumothorax when phrenectomy has been done.

(2) Supplementing thoracoplasty

In the average case, the pulmonary relaxation occasioned by paralysis of the diaphragm, equaling from one-fourth to one-third the lung volume on that side, will permit of a less extensive ribresection to gain the same amount of compression as in thoracoplasty alone. It permits a more gradual change in pressure when used as a preliminary stage, allowing for slower accommodation of intrathoracic organs. The objection to phrenectomy on the grounds that adhesions, about the base, have already immobilized the diaphragm and will prevent any rise, following paralysis, in my opinion, is not sound.

(3) As an independent measure

Phrenectomy has gained the prestige of standing by itself. A few years ago there was almost complete agreement that phrenectomy must be a supplementary procedure. This attitude has been

changed by observing patients, upon whom phrenectomy had been performed, as a preliminary stage of thoracoplasty, or when the patient was too sick to consider anything more radical, proggress so satisfactorily that thoracoplasty was considered to be unnecessary

Phrenectomy will obliterate intrapulmonary cavities that are not too extensive

Many patients with profuse, repeated pulmonary hemorrhages have stopped bleeding coincident with paralysis of the diaphragm

Yates advocates phrenectomy in place of artificial pneumothorax and says it will accomplish all that artificial pneumothorax can, without the dangers incident to pneumothorax treatment and the inconvenience of repeated refills over a period of years. It is going to take time to provi the correctness of this view.

Indications for Chest Collapsing Operations—To collapse one side of the chest, permanently throwing out of commission the whole of one lung, results in crippling of the individual Careful study is imperative before electing this type of therapy. The question of the future prospect of the patient, with treatment continued along conservative lines, must be considered. If from the result of experience, it is thought that the prognosis is bad, then, in the absence of contraindications, major surgery is indicated. Chronicity, prolonged hospitalization, dangers of

FIGURE 2 CASE 1
19 months after phrenectomy Symptomless Doing her own housework. Weight 131 Note high position of diaphragm

spreading the infection and ultimate death from tuberculosis are weighted against the mortality incident to operation and the forty to sixty per cent chance of so complete an arrest of the disease as to allow the patient to live at home and be partially, or wholly, self-supporting

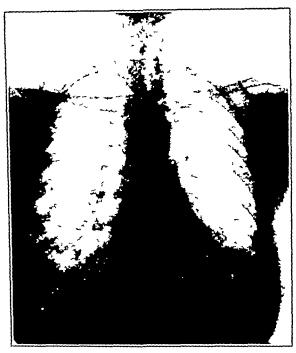

FIGURE 3 CASE 2
Female Age 39 Large cavity above left diaphragm

Extensive unilateral disease with marked fibrosis and cavitation, with the heart and trachea pulled toward the diseased side, the diaphragm pulled up and the ribs together, is the most satisfactory type for thoracoplasty

Large pyopneumothorax cavities require extensive resections in order to bring the layers of the pleura together and obliterate the cavity

Localization of the disease in one lobe, either upper or lower, and with the remaining lobe free from disease, is best treated by a partial thoracoplasty with sufficient resection of a limited number of ribs to allow collapse of the involved lung and maintenance of function in the normal lobe

Certain Points in the Technique of Operations—Phrenectomy—the phrenic nerve arises from the third, fourth and fifth cervical roots. It passes from above and externally, downward and forward across the scalenus anticus muscle. It is easily accessible to approach through a short horizontal incision behind the posterior border of the steriomastoid muscle, in the fossa just above the clavicle. Impulses through the nerve may be interrupted by alcoholic injection in the nerve, crushing of the nerve, simple section or section and removal of the distal portion of the nerve by gradual twisting. It is not uncommon to remove between thirty and forty cm of nerve by this means. The last method—exaresis—is the one

commonly used and causes a permanent paralysis. For a temporary paralysis, crushing the nerve with a hemostat, after the method described by Yates, is preferable. The operation is performed under local anesthesia. While the nerve is being pulled upon, some patients complain of severe pain in the chest and, in very nervous patients, a few inhalations of gas-oxygen during this stage, may be desirable. To insure complete, permanent paralysis, Gravesen advocates removal of at least ten to twelve cm of the nerve because, in from twenty to thirty per cent of cases, there is an accessory phrenic which joins the main stem below the level of the subclavian vessels.

Thoracoplasty - Sauerbruch's posterior paravertebral thoracoplasty is a subperiosteal resection of ribs-one to eleven, inclusive Varying lengths of ribs are resected, according to the size of the chest and the indications Usually the total varies from one hundred and twenty to one hundred and sixty cm for a complete thoraco-It has been shown that a shorter resection of ribs will permit a better collapse if the resection is carried back to the transverse processes of the vertebrae The operation is best performed in stages—usually two—although some operators elect a one-stage operation for certain cases Sauerbruch, Gravesen-who is following the foot-steps of Saugman-and others of extensive experience, advise the removal of the lower ribs

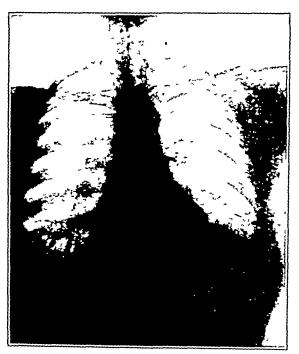

FIGURE 4 CASE 2
Obliteration of cavity following phrenectomy

in the first stage Their experience has been so great that any departure from their routine must have sound reasons To obtain a good collapse.

in extensive disease with apical involvement, it is necessary to resect the first rib which will allow caving-in of the apex of the chest. Resection of

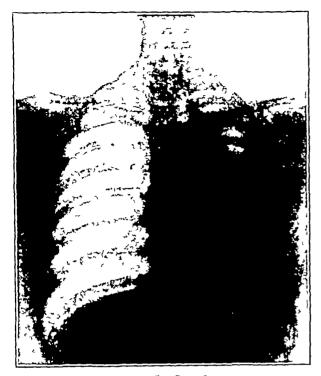

Figure 5 Case 3

Female Age 42 Extensive left-sided disease Typical case for chest collapsing operation

the first rib is the most difficult phase of the operation, because of its depth in the wound and the intimate relationship of the subclavian vessels The rib guillotine of and the brachial plexus Lilienthal aids greatly in cutting the first rib Stages of the operation should be as close together as the patient's condition will permit because, if too long an interval elapses, there will be considerable new bone formation in the field of the first Usually from stage, interfering with collapse ten to fourteen days is a satisfactory interval Local infiltration and nerve block with novocain is the anesthesia of choice. This question of anesthesia is the subject of considerable difference of opinion, some surgeons prefer to supplement local with inhalation anesthesia-mainly gas-Gravesen and oxygen. Sauerbruch uses local Archibald use the combined anesthesia of local plus inhalation Operating time is probably shorter when the patient is unconscious but it should rarely take much over an hour to complete a stage under local, including the time spent in injecting the anesthetic

Some form of compressive dressing is applied to the chest after operation to guard against hemorrhage in the operative field, to prevent paradoxical movement of that portion of the chest which is unsupported by ribs and to cause, gradu-

ally, an increase in the extent of the collapse which does not reach the maximum until several weeks have elapsed Compression throughout this period is of value

The contrast between the X-ray picture of a chest collapsed by thoracoplasty and the appearance of the patient's chest, is striking. There is much less deformity and chest asymmetry than one would suppose to be possible. Dressed in ordinary clothing, the deformity passes unnoticed. When, at operation, the wound is carefully closed in layers and early post-operative motion of the shoulder is insisted upon, it is surprising to see so little impairment in function of the shoulder motions.

When there remain unobliterated apical cavities, it is sometimes necessary to supplement a posterior thoracoplasty by anterior resections or the more formidable apicolysis

For a partial thoracoplasty, the removal of a limited number of ribs from the transverse processes to the sternum will allow collapse of the diseased area and preserve function in the uninvolved lung

I have had no experience with intrapleural pneumolysis, either by thoracotomy or through the thoracoscope, in pulmonary tuberculosis Jacobeus reported an eight per cent mortality from empyema complicating the cutting of adhesions

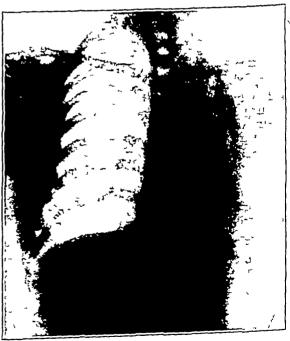

FIGURE 6 CASE 3
Symptomiess one year after combined phrenectomy and paravertebral thoracoplasty

through the thoracoscope In one case of bronchiectasis, in which satisfactory compression, by artificial pneumothorax, was impossible, because

of adhesions between the lung and parietal pleura, we were led, by X-ray and fluoroscopic study, to believe that the adhesions were few and cord-like. Upon opening the chest to sever these adhesions, it was found that the adhesions were extensive and that the X-ray study had given an erroneous idea of operability.

The recent suggestion of Yates—that removal of certain lesions by Graham's cautery method of pneumectomy may be the logical procedure—is interesting when one reviews the history of the early surgical work in pulmonary tuberculosis Extirpation was considered the ideal and successful resections were reported by Stretton, Tuffier, Doyen, Lawson, Sonnenburg and McEwen I am unwilling to try out his suggestion at this time

Results of Surgical Aids — Phrenectomy — There is no operative mortality. The operation is almost free from accidents. In one case, the thoracic duct was opened but simple ligature of the leaking area was followed by perfect healing. In another, troublesome hemorrhage was encountered from the transverse cervical artery. The patient showed no appreciable effects of the blood loss.

In most cases, following paralysis of the diaphragm, there is almost immediate improvement, the temperature and pulse tend to subside, the patient feels stronger, eats better and begins to gain weight. Cough and expectoration diminish markedly and may stop entirely

The following quotation was contained in a letter from a physician, upon whom a phrenectomy was performed by Dr. Wells of Saranac, for rather extensive disease of the right lung which was being treated, with only partial success, by artificial pneumothorax. "The effect of the procedure (phrenectomy) was immediate and striking. My temperature and pulse dropped that day and have been down ever since. Cough decreased and I lost the spasmodic attacks I had been having. Sputum increased for forty-eight to seventy-two hours and, since then, has been decreasing

I feel great—have been sleeping and the old appetite is picking up. I had the most remarkable subjective sensation of rest and peace—I don't know how else to describe it—on that side, immediately afterward, and it has persisted"

Chest Collapsing Operations—Naturally, so extensive an operation as a thoracoplasty, performed upon sick patients, will have some mortality. However, it is surprisingly low. Sauerbruch, in over nine hundred thoracoplasties, reports a four per cent mortality. Gravesen reports a seven per cent mortality and Archibald an eight per cent mortality.

From twenty to twenty-five per cent of cases treated by thoracoplasty will die of progression of the disease in a few months following operation. On the other hand, the reports of much improved, or relatively cured, cases vary from forty-seven to sixty per cent. In a series of one hundred and nine cases, followed from one to seven years after operation, Gravesen reports forty-three per cent able to work.

The operative mortality and the later deaths from progression of the disease will depend, to a large extent, upon the selection of patients for major surgery. The extent of the rib resection plays some part in the mortality—the shorter the resection, the less the mortality

Conclusions

- (1) Surgical aid is frequently of great importance to a case of pulmonary tuberculosis before it becomes advanced Procrastination, in electing the correct method of treatment at the right time, results in patients too far advanced for recovery
- (2) Phrenectomy, as an independent measure, deserves an important position in the treatment of pulmonary tuberculosis
- (3) Thoracoplasty, in a group of patients with advanced disease and a bad prognosis, allows a decidedly worth while percentage to return to their homes and gainful occupations

UNDULANT MALTA FEVER, WITH A REPORT OF A CASE*

By H B GILLEN, MD, COHOES, N Y, and H C GORDINIER, MD, TROY, N Y

EFINITION—An infectious disease of long duration caused by the Brucella melitensis and Brucella abortus, closely related organisms, and characterized by a series of pyrexial attacks, with constipation, muscular pains, arthritis, anemia and enlarged spleen

Etiology—The earlier history of this disease concerned itself almost exclusively with the micrococcus melitenis, discovered by Bruce in 1886. It was considered to be a small coccus, Gram-negative, growing singly, in pairs,

* Read before the American Therapeutic Society, May, 1927

or in short chains. At that time it was thought to be transmitted through goats' milk, chiefly on the shores of the Mediterranean, and to a less extent in the tropics and goat rearing sections. It was not until 1918 that Evans established the relationship of Brucella melitenis causing Malta fever in goats, and the Brucella abortus causing contagious abortion in cattle. These two closely related organisms are now considered to be the etiological agents of undulant fever, the former transmitted through the drinking of raw goats' milk from infected

goats, the latter through cows milk from cows that have aborted Absolute evidence of this transmissibility to man was established by Keefer in 1924 with the publication of a case in man Additional evidence of the relationship of infected cows' milk is furnished by Evans, Duncan, Huddleson and Carpenter Laboratory infection, hogs and slaughtered cattle are also considered as sources of infection

Distribution in the United States—The fact that so many cases have been reported from so many widely separated areas leads to the conviction that the disease is almost ubiquitous in the United States and not confined to any particular area as once was the supposition In support of this fact it is to be recalled that cases have been reported in Baltimore, Washington, D C, Utah, South Dakota, Wisconsin, New York, California, Connecticut, Virginia, Michigan and many other areas

Mode of Infection — From a review of the reported cases it is probable that the source of infection is through drinking raw goats' and cows' milk from cattle that have aborted, laboratory infection in workers using cultures of the organisms, slaughtered cattle and hogs Since the organisms are present in the discharges of infected animals, it is probable that water may possibly be a source of such infection

Symptoms -

1 Pyrexia—102° to 104° to 105°, markedly irregular or even intermittent

2 Gastric disturbances, constipation obstinate, nausea and vomiting not infrequent, diarrhoea occasionally

- 3 Profuse sweats
- 4 Muscular pains
- 5 Headaches, restlessness
- 6 Spleen enlarged

The characteristic attack is that of a period of fever, with symptoms lasting one to three weeks. A period of defervescence follows, there may be slight fever or normal temperature and convalescence in from ten to twelve days. Relapse occurs for shorter periods. There is often a long apyrexial period, which may again be followed by milder relapses. The number of undulations are variable, about three in mild cases but they may be numerous. The duration is uncertain and variable, lasting three to six months or the disease may be prolonged to two years.

The symptoms often accompanying undulant fever are severe headaches, arthritis with often a large effusion, pain agonizing in character, especially in the sacroiliac joint, or orchitis and epididmitis with pain and even slight swelling, fibrositis, especially at the ankle joint,

anemia (progressive in type), great debility and insomnia

Pathology—The spleen is enlarged and organisms are constantly present in it and may be obtained by aspiration. There is also degeneration of the liver and kidneys. Acute nephritis may occur. The intestinal tract shows nothing characteristic.

Diagnosis — Clinically it is difficult The type and course of the fever, associated with headache, nausea and vomiting, constipation, and joint pains would be suggestive, but not conclusive

Laboratory methods are the best means of confirming the diagnosis Blood cultures from suspected persons, blood serums, from the patient on which agglutination and agglutinin absorption tests are made, render a positive diagnosis

Larson and Sedgwick in 1913 demonstrated that many persons harbor agglutinins for Brucella abortus in their blood. Evans considered that a reaction in a 1.20 dilution was suggestive and should receive further study. Hull and Black only considered a reaction that was complete in a 1.50 dilution. Dilutions are usually made 1.25 and 1.500. Report of one case in a dilution as high as 1.6400 was made by Evans.

The history is important in that possible sources of infection may give valuable information, leading to a possible diagnosis

Differential Diagnosis —Undulant fever must be differentiated from the following diseases

- 1 Typhoid and paratyphoid fever
- 2 Malaria
- 3 Acute and subacute rheumatic fever and from infectious arthritis
- 4 Tuberculosis
- 5 Tularemia
- 6 Subacute bacterial endocarditis

the patient, Case Report -- Present illness white, male, age 54, was taken ill January 14, He complained of nausea, slight recurring colic-like pains in his abdomen His tem-Pulse a little accelerated perature was 100° It was discovered by his physician that he had an urticarial-like rash over the entire trunk He was sent home and the following morning his temperature was 994° and in the evening rose to 103° He was nervous and irritable, he was quite discomforted from the irritation of the urticarial rash which still persisted His temperature continued with an afternoon exacerbation and a slight morning remission February 13, 1927, he was sent to the Cohoes Hospital by his physician He complained of weakness, loss of appetite, recurring slight chilly sensations and some discomfort and pain in the back, and perspired freely

Expunination —Disclosed a fairly well nourished man without dyspnea, cyanosis or edema.

Tongue Without tremor, coated brownish white, save at the edges which were perfectly free

Throat Slightly red

Pupils Mid-wide, equal and reactive both direct and consensually Discs and urinal normal

Hearing Perfectly normal

Facial Muscles Symmetrical and normal

Lungs Chest movements were normal Respiration 20 Lungs clear throughout

Heart Heart's impulse in normal position Cardiac dullness 9 cm to the left of the midsternal line and 1 cm to the right Heart sounds perfectly clear, no abnormal accentuations, no adventitious sounds

Liver Liver duliness in the 5th interspace to 2 cm below the costal margin. Lower border perfectly smooth and not at all tender on

palpation

Spleen Splenic dullness, on percussion, extends from the 9th to the 11th rib in the midavillary line Spleen at this visit not palpable.

Abdomen Moderately full. No muscle spasm or tenderness detectable No roseola found An erythematous rash was found, discreetly distributed over the abdomen and chest

Reflexes Tendon reflexes of both upper and lower extremities were slightly hyperactive All superficial reflexes were present and active.

Laboratory Findings—The usual routine examination of the urine showed an essential negative finding Diazo reaction, on repeated examination, was negative. Urine and feces were tested for typhoid, paratyphoid and B dysenteriae, but were negative on each occasion Blood culture was sterile after 120 hours Blood submitted for complement fixation test, both for tuberculosis and syphilis, negative B melitensis was definitely agglutinated in a 1 1280 dilution of the blood serum, and partially agglutinated in a 1.2500 dilution of the blood serum, while no agglutination of B typhosus or B paratyphosus was obtained Blood counts showed a leucopenia 5600, 5000, 4800, 5480, the differential contained 85% of small lymphocytes, 5% large lymphocytes, 10% large mononuclears, 205% transitionals, 55% polynuclear neutrophiles, 05% myeloctes, and 005% basophiles The red cell count was 5,280,000, no variation in size or shape. Blood smears were negative for malarial parasites

Specimens of milk and blood were obtained from the cow whose milk Mr N had been drinking Organisms of the abortus-melitensis group were definitely agglutinated in a 1 40 dilution of the cow's serum. No organisms of this group were found in the specimen of milk, but their presence may have been intermittent.

Worthy of mention in this case is the absence throughout of a positive Diazo reaction in the urine, also the retention through the entire course of the febrile reaction of the infraumbilical reflexes. In the typhoid group of fevers, the umbilical reflexes are almost never present and the Diazo reaction positive

A noteworthy feature of this case was that each evening about eight, the patient was seized with a severe prolonged rigor followed by the evening exacerbation of temperature, after which there was a profuse drenching perspiration. With this evening rise in temperature, he became excited, nervous, irritable, but displayed no delirim at any time. During the course of the illness, he suffered with remarkable vasomotor flushings.

Mr N's temperature, as shown with accompanying charts, continued with evening exacerbations and morning remissions for about ten weeks with two or three intermissions lasting a day or two At present his temperature is perfectly normal, it has been so for a period of about three weeks and he seems perfectly well

Treatment—His treatment was eliminative and expectant All precautions were used similar to those in other acute infectious diseases, such as typhoid fever

A vaccine for undulant fever has been used rather extensively in Europe, but so far as we could ascertain from a study of the literature, rarely, if at all in this country. Hence, we felt warranted in not attempting its use

Acriflavine was considered as a therapeutic agent in this case, but owing to the fact that it had been thoroughly used by Warren, Smith and Linder on two cases reported from the Clifton Springs Sanitarium, without any apparent results, we concluded not to use it

It is interesting also here to note that in the last issue of the American Medical Association Journal of May 7, 1927, a case is reported in which mercurochrome used intravenously seemed to have a very salutary effect.

Our object in recording this single observation is to add another case to the few now on record and especially to draw attention to the fact that undulant fever is probably much more prevalent in this country than heretofore supposed, and also to state that from a diagnostic standpoint, this disease must be carefully considered in every long continued fever. Our laboratories, therefore, should be equipped to perform the serological and cultural tests necessary for its recognition.

We wish to thank Dr Ruth Gilbert of the New York State Health Department for her interest and cooperation in directing the laboratory work of this case.

PERINEPHRITIC ABSCESS IN CHILDREN*

By ADOLPH G DESANCTIS, MD, NEW YORK, NY AND

HENRY A. REISMAN, M.D., JAMAICA, N. Y.

ERINEPHRITIC abscess is the result of an unresolved inflammation of the loose areolar tissue surrounding the kidney which has gone on to pus formation Just as some cases of cervical adenitis will resolve and others break down to form an abscess of the cervical glands, so will many cases of perinephritis resolve and probably remain clinically unknown and go on record as a cured case of fever of unknown origin or of gastrointestinal upset. It is only when the perinephritis breaks down with pus formation and either points posteriorly in the lumbar region or a mass is felt in the abdomen in the region of the kidney that we begin to suspect a perinephritic abscess

The literature has greatly neglected in recent years perinephritic abscess in children Gibney¹ up to 1880 reported 28 cases of permephritic abscess (not all children) Nieden2 in 1897 found records of 166 cases of whom 23 were under 15 Kuster* between 1896-1902 found years of age records of 230 cases, 24 of whom were under 10 years of age Townsend observed 6 cases in nine years, 1894-1903, of which the youngest of the group and on record was about 5 weeks of age

From May 18, 1920, to May 18, 1927, in the New York Post Graduate Medical School and Hospital a total of 37 cases were observed, seven of whom were children

Case 1, No 49626 History-M P E, female, age, 6 weeks, weight, 6 pounds Admitted May 18, 1927 Two weeks after birth, infection in left finger which subsided, followed by infection in right elbow which became red and swol-

* From the Pediatric Department—New York Post Graduate Medical School and Hospital

Mother then noticed swelling in right flank posteriorly

Physical Eranunation — Appearance shows evidence of malnutrition Abdominal examination with anesthesia revealed mass in kidney region extending to right lower quadrant, soft and fluctuating Posteriorly, fluctuating mass about size of egg just below free border of costal margin Mass was aspirated (on day of admission and pus obtained)

Diagnosis —Perinephritic abscess

Operation -5/18/20, abscess on elbow incised and drained 5/19/20, incision over right kidney lumbar region pus obtained

Temperature -97 on admission Reacted after operation to 101 then fluctuated Temperature at death 97°

Laboratory Examination -Two cultures from perinephritic abscess and one from elbow showed staphlococcus albus

Case 2, No 29303 M B, male, age, 5 years Admitted April 2, 1923 Chief complaint, 1, Dyspnea since yesterday, 2, Irregular fever, 3, Frequent colds

History - Frequent colds since birth weeks ago had pneumonia One week prior to admission feet became swollen, then whole body appeared swollen

Physical Examination -General condition, poor Yellowish skin and somewhat cyanotic eyes, petechiaon sclera and conjunctivae Neck, marked venous pulsation Heart—1, Heaving impulse, 2, Double mitral murmur, 3, P2 greater than A2 Abdomen, large mass over right kidney Skin, small hemorrhagic spots on shoulders

Temperature -100, rose to 103 and remained high Pulse 160 Resp 40

Diagnosis -- Malignant endocarditis Perinephritic abscess

Laboratory Examination—Blood chemistry negative Blood Wassermann negative Blood count, RBC, 948000 Hbg, 18% White cells, 6400 Polys, 61%, Lymphs, 36%, Urine, negative

Complications —4/30/23, discharging left ear, with mastoiditis Died April 4, 1923

Case 3, No 30461—J P., male, age, 10½ months Admitted May 11, 1923 Chief complaint—1, fever, 2, gas, 3, stomach trouble, 4, cranky

History—Six weeks ago child had pneumonia during which both ears were opened. Three weeks ago child began having boils which were opened at various intervals. Last boil incised two days ago. One week ago child had fever, both ears were opened with relief but was cranky all week. Abdomen became distended. Patient was in another hospital for above condition.

Physical Examination—Poorly nourished, both ears draining Abdomen-mass in region of right kidney seems to be continuous with globular swelling in right lumbar region which is neither red nor inflamed but slightly fluctuating

Temperature—102 Subsided after operation Diagnosis—Perinephritic abscess

Operation -- May 15, incision in right lumbar region

Laboratory Examination — Urine, 4 specimens, negative Blood count—white cells, 29800, polys, 60%, lymphs, 40% Culture from abscess, Staph Aureus

Complications —Furuncle of right buttock Discharged —Cured June 3, 1923

Case 4, No 39453—C S, female, age, 28 months Admitted March 10, 1924

Clucf Complaint—1, Anorexia for past five days, 2, Inability to straighten out legs, 3, Boil on ribs two weeks

History—Two weeks ago pain in right lower rib Mother noticed a small red boil which did not come to a head. Five days ago child had high fever, anorexia, and held left leg fixed to abdomen. Effort to straighten leg causes pain and marked resistance. Walks with difficulty on toes. Symptoms most marked past three days.

Physical Examination—Well nourished infant. Abdomen-spasticity and rigidity chiefly in left side. Mass in abdomen in region of lower part of left kidney.

Diagnosis—On admission 1, Perinephritic abscess, 2, Psoas abscess

Laboratory Examination —X-ray, genito urinary tract, negative Kidney, normal size Lumbo-sacral spine, negative Blood, white cells,

25300, polys, 84%, lymphs, 15% Urme first two specimens showed few pus cells. Next two specimens were negative and subsequent specimens after operation showed many pus cells.

Temperature —On admission, 102, fluctuated between 100 and 103 Four days after operation dropped to normal

Operation —3/14/24 Incision and drainage in lumbar region for perinephritic abscess, pus obtained

Discharged — Cured April 13, 1924

Case 5, No 19425 A B, male, age, 3 years 2 months Admitted November 17, 1926

Clust Complaint—1, fever, 2, diarrhea, 3, cough, 4, mability to move leg

History—Fever five days ago with abdominal distension. Then developed cough and child perspired profusely. Temperature fluctuated as high as 105. Abdominal distension continued and father noticed that child did not move left leg.

Physical Examination —Well nourished child Throat, congested Abdomen, distended, tympanitic indefinite mass in left lower quadrant with tenderness Left knee flexed, extended with difficulty and considerable pain. Right leg, normal Left thumb, paronychial infection with possible bone involvement

Diagnosis —Psoas abscess Perinephritic abscess Paronychial infection left thumb

Temperature —On admission, 102 Pulse, 148 Respiration, 30 Temperature fluctuated irregularly as high as 106

Laboratory Examination — Urine negative. Blood count white cells, 16000, polys, 84%, lymphs, 16% Blood culture, negative X-ray of spine, negative

Operation —Laparotomy-intraperitoneal cavity negative, left kidney was fixed with marked retroperitoneal edema. No fluctuation. Child developed cardiac failure under anesthesia—incision closed, did not respond to stimulants and died 48 hours later.

Case 6, No 74554~V~C, male, age, 10 months Admitted 5/14/27

History—Fever 10 days Crying continually, difficulty in breathing and became drowsy

Physical Examination—Well nourished infant acutely ill In typhoid state, has croupy cough Lungs and heart negative Abdomen, smooth mass felt in region of left kidney

Diagnosis - Perinephritic abscess

Laboratory Examination — Urine-albumin (large amount), pus cells (many), bacili—countless motile bacilli X-ray, chest negative, kidney enlarged Blood count, white cells, 17200, polys, 82%, lymphs, 18%

Temperature - Fluctuated between 102 and 104

Operation —5/13/27—Incision and drainage for perinephritic abscess, pus obtained

Culture — From pus bac col communi Died 5/18/27

Case 7, No 24652 M K, male Age, 1 month 6 days Admitted 5/17/27

History—Crying and fever since 5/16/27 Cause undetermined by family physician On May 12, 1927, mother noticed swelling in right flank

Physical Examination —Well nourished infant, crying Abdomen, swelling right abdominal flank, tender and fluctuating

Laboratory Examination—Urine, negative Blood count white cells, 13800, polys, 69%, lymphs, 31%

Temperature —101 on admission Subsided after operation

Diagnosis —Perinephritic Abscess

Operation —Incision over right kidney region, pus obtained

Organism — Staphylococci Isolated from pus Discharged — June 7, 1927 Cured

Discussion

The problem of perinephritic abscess is purely diagnostic. The early recognition and subsequent surgical interference with as little delay as is necessary to corroborate, the diagnosis will materially decrease the mortality rate. To await the diagnosis until the abscess points posteriorly or a large mass is felt in the abdomen is delaying surgical intervention. It is as important for us to be on our guard for a perinephritic abscess as in an appendiceal abscess, although it is by no means as frequent.

Etiologically it is of either renal or extrarenal origin. The extrarenal origin is the more important of the two. In our series of cases in children not one was secondary to a kidney infection. This mode of infection is comparatively rare when one takes into consideration the incidence of renal disease. Hunt from the Mayo Clinic collected for a period of ten years. Jan 1914-Jan 1924

Nineteen perirenal abscesses in 742 nephrectomies for pyonephrosis

Twelve perirenal abscesses in 1234 cases of renal lithiasis

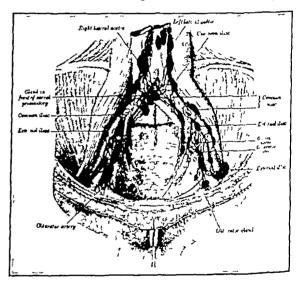

Ten perirenal abscesses in 644 nephrectomies for renal TB

Making a total of 41 cases of perirenal abscesses secondary to 2620 cases of primary renal disease. Miller found evidence of renal disease in four of a total of 36 cases. However, Braash with a total of 67 cases found that 38 were secondary to renal disease.

Permephritic abscess secondary to renal discase is usually through the lymph channels or di-

rect extension The lymphatic vessels of the kidney form three plexus, one in the substance of the kidney, a second beneath its fibrous capsule and a third in the perinephritic fat. The second and third communicate freely with each other The vessels from the plexus in the kidney substance converge to form 4-5 trunks which issue at the hilus, here they are joined by vessels from the plexus under the capsule and following the course of the renal vein end in the lateral aortic The perinephritic plexus is drained directly into the upper lateral aortic glands These glands are situated adjacent to the psoas muscle particularly on the left side. Hence when they become secondarily involved, they may produce symptoms simulating Potts disease with psoas abscess or hip-joint disease because of contracture of the psoas muscle

Of the seven perinephritic abscesses in children three were on the left side and of the three, two gave some evidence of irritation of the psoas muscle. This is due to the fact that on the left side the lateral aortic glands which drain the perinephritic abscesses in children three perinephritics.

nephritic tissue are situated directly on the psoas muscle. Hence when the glands are secondarily involved they will cause an irritation of the psoas muscle with subsequent contracture giving rise to symptoms referable to either psoas abscess or hip joint disease. On the right side the glands are situated on the great vessels. Of the four perreial abscesses that were on the right side, not one gave evidence of irritation or contracture of the psoas muscle.

To illustrate psoas irritation in left perinephritic abscess let us review two cases

C S, age 28 months Diagnosis left perinephritic abscess, had inability to straighten left lower extremity and kept it flexed on abdomen

A B, age 3 years and 2 months Diagnosis left perinephritic abscess, the father noticed that child did not move left lower extremity and it

was extended only with difficulty, resistance and considerable pain

We feel that this is a valuable sign in left

perinephritic abscess

The extrarenal of primary perinephritic abscess is due to metastasis usually from an insignificant infection. Five of the seven cases were definitely due to metastasis, of the remaining two, one gave a history of an upper respiratory infection and in the other the cause was undetermined Four of the five, that gave a definite history of metastasis, had boils, superficial abscess or paronychia prior to the onset of the perirenal abscess and the fifth was a metastasis from an endocarditis evidence that the condition is of metastatic origin was had when a culture from a superficial abscess which was incised on admission gave the same organism as that obtained from the perinephritic abscess on operation, namely the staphlococcus al-In four out of five cultures taken, staphlococci either albus or aureus were obtained staphlococcus was isolated in all cases preceded by boils or superficial infection Copes reports three cases following whitlow and stresses this as the etiological factor. In 100 of the 108 cases collected by Richardson, there was a history of furuncles, carbuncles, felons, paronychia, tonsilitis and septic wounds

It is difficult to explain how the infected embolus passes into the renal artery through the kidney and thence into the perirenal fat. Many are of the opinion that the embolus becomes embedded in the cortex forming a cortical abscess too small for detection which ruptures into the perirenal tissue Of 108 cases supposed to be due to metastatic infection, Richardson^o found that in 33 cases the perirenal abscess was apparently an extension of a cortical abscess. However, it is not at all unlikely that since the plexus of lymph vessels in the perirenal fat intercommunicates freely with the lymph vessels directly beneath the capsule, the infection may spread from the metastatic cortical infection through these lymph channels directly into the perirenal tissue.

The urine is often negative. In only two cases was ous found in the urine. Not until the cortical abscess communicates with the calices and thence the pelvis does pus appear in the urine

Perinephritic abscess may sometimes be mistaken for Potts Disease or hip joint disease The absence of kyphosis, the sudden onset and rapid formation of an abscess with a leucocytosis and a high temperature should rule out tuberculosis of the spine for they are rarely found in beginning Potts Disease. In hip joint disease all motion is limited whereas in perinephrite abscess only extension is limited. In hip disease there is marked spasticity with atrophy of muscle

Given an infant or child with unexplained fever. gastro-intestinal disturbance, vague abdominal symptoms, a leucocytosis and a history of whitlow, one should always think of a perinephritic abscess. When an abdominal mass is palpated in the region of the kidney or the abscess points posteriorly then the diagnosis is almost certain

REFERENCE COMMITTEES

The preparations for the annual meeting of the Medical Society of the State of New York are more extensive and complete than ever before because the activities of the Society are now standardized on a broad, permanent basis The reports and suggest the officers and this Journal been committe ce commitand rtion to be OI tees

taken by the House of Delegates at its annual meeting

Some medical societies have adopted the Fplan of appointing the Reference Committees a na ionth in advance of the annual meeting, in order their members may have time to make confin , mil tory investigations and to formulate broad do plans that shall secure coordination of their variagrous ac ficec tivities

POPULAR EDUCATION IN PUBLIC HEALTH

Success in public health work depends on the support of the people quite as much as on the skill and earnestness of the doctors Arousing favorable public opinion toward the scientific work of the doctors is the peculiar field of lay health organizations

The practice of public health and civic medicine requires a combination of three condi-

tions

- 1 Scientific knowledge made available by a few research workers
 - 2 Physicians ready to apply the knowledge
 - 3 People ready to receive it

A movement in public health starts from a center of discovery and spreads through a community in ever-widening waves The center is usually a research laboratory where the discoveries, such as toxin-antitoxin and insulin are developed As the waves advance they While the research diminish in intensity worker is familiar with all phases of the subtect, the family physician needs to be familiar with only the application of the product or method, while the layman needs to know only that it exists, and is valuable as a health measure and is available at the office of physicians

The speed of propagation of waves of medical knowledge from a center is usually in direct proportion to the need of a community. Physicians apply a preventive measure according to the demand which the people make for it. A case of smallpox, for example, speeds up the distribution of knowledge of vaccination, and a desire for its application as a preventive measure, but the demand for the procedure often changes to opposition when the epidemic passes by

The function of a lay organization is to create a demand for public health where none has previously existed. It seeks to transform knowledge into strong desire and finally into action. Physicians will supply the scientific knowledge and the means of applying it, but lay organizations are charged with the work of arousing a strong public sentiment which will lead all the individuals of a community to seek and accept the advice of the doctors.

Two methods of transmitting medical advice to the people are in common use

- 1 Through the doctors
- 2 Directly to the people

This distinction is important and is at the basis of much misunderstanding between the doctors and lay organizations Physicians are

the sole dispensers of medical service, and they are the best judges of what service is needed, from surgical operations to popular medical advice It seems self-evident that the advice of physicians should be followed and also sought by lay organizations engaged in health education and demonstrations Physicians expect lay organizations to do the work of educating people in medical topics, and they are willing to endorse the new movements and demonstrations conducted by laymen, but the doctors also expect to be consulted during the course of the demonstrations A movement which is in a state of evolution, as is the practice of public health and civic medicine, requires constant readjustment, in which the physicians are deeply interested When a demonstration has gone on for a year or five years, courses of action become crystallized and a change difficult, only by frequent conferences can medical misunderstandings be avoided

The psychology of leading people in public health is a fertile field of investigation, experimentation and demonstration. No movement has sprung full grown from the brain of any man or organization. The most successful movements in public health have been developed from within a community as a result of the active support of its doctors. The first essential in any public health movement is that physicians shall take an active part in it and not merely support it with a resolution at the annual meeting of the county society.

The attitude of physicians toward public health has undergone an evolution during the last decade Physicians were opposed to the practice of public health when the methods were those of socialism and state medicine Doctors were luke-warm and mactive when the seemingly impossible task of popular medical education was first proposed, and they stirred themselves into action when practical clinics in tuberculosis, child welfare and other subjects were proposed, and they became almost enthusiastic as the modern programs of public health and civic medicine were developed along practical Today the situation is that physicians realize their duty to assume the leadership in public health and civic medicine. They cannot afford to live only in the past with its contests and failures mingled with its successes The present has its problem of developing a program which will be suited to the needs and resources of the individual communities That program will be as varied as the temperaments and resources of the people, as diagnosed by physicians

THE LONDON LETTER

This issue of the Journal introduces a new department, the London Letter, in order to set forth the greater medical movements which are developing in England. These letters will give special attention to administrative medicine and the practical methods which are peculiarly adapted to English customs.

England has made some daring experiments

in the social side of medicine, but the English methods of private practice and hospital management are similar to those of the United States It must be remembered that many medical customs differ widely in the several States. The London Letter will be fitting company for the Journal's department of Our Neighbors, which describes conditions in other states.

SURVEY OF THE SIXTH DISTRICT BRANCH

Self examination is an excellent procedure to which doctors are not given. Physicians like the real heroes of the World War, do not wish to discuss the value of their own achievements, or those of their medical societies, yet the modern practice of public health requires that physicians report their activities for the benefit of both themselves and their neighbors.

The officers of County Societies do more work than they realize, and when their activities are listed on a balance sheet the total is commendable. The record for the Societies of the Sixth District Branch, made by their own officers is printed on page 608—of this issue. It would have been more extensive if it had been made by observers from outside the counties.

LOOKING BACKWARD

THIS JOURNAL TWENTY YEARS AGO

The Tuberculosis Problem The prevention of tuberculosis was just becoming recognized as a public health problem twenty years ago It is a striking coincidence that while the National Tuberculocic Association is now conducting a campaign for the early recognition of tuberculosis, this Journal of May 1908 printed seven articles on the same subject, covering thirty-two pages The first article was by Dr John H Pryor, of Buffalo, who said "Outside of New York City in this state prevention seems to be a delusion and a snare Of 100 patients questioned within the last two years only one-third had received reasonably accurate or complete instruction Even when methods of prevention are properly taught and supervised, in a home, infection may occur The discipline and control which are possible in special institutions seem to be entirely successful, but elsewhere the danger exists in a comparative degree

The whole system of prevention, as it exists today, is largely a diplomatic game between the physician and the health authorities, and its chief purpose seems to be the encouragement of false security and the study of results instead of causes,

No consumptive should be allowed to reach a stage when he can communicate the disease to another without an attempt to supply rational relief and segregation. Fortunately some time must elapse after the disease can be recognized before the malady can be conveyed. It has been proved that we can no longer wait, in a large number of instances, for the patient to seek us with his complaints. He evidently must be searched for and found, and the place to look for him is among those who have been exposed. Given an advanced case, an incipient should be traced who is following in his path. The principal places to search are the house and the workshop.

Physical disinfection of premises was considered a major preventive for Dr Pryor says

"Disinfection after death may be most imperfect and simply give rise to false security"

The term phthisis was still in common use and one of the articles was entitled "The early diagnosis of phthisis"

The conditions revealed by this series of articles are in marked contrast with those of the present day when popular sentiment supports all measures necessary for the prevention of tuberculosis

MEDICAL PROGRESS

Prognosis and Control of Patients with Heart Disorders in Pregnancy-Burton E Hamilton urges the importance of proper classification in the control of patients suspected of heart disease in pregnancy For the purpose of prognosis and treatment he separates all patients into three groups Class I, those with severely damaged hearts and those who have congestive heart failure, past or present, rheumatic fever, present or recent, or signs of active endocarditis, a dangerous disorder of the heart such as auricular fibrillation, a serious complication such as nephritis or hypertension Class II, cardiac cases with signs of possible or doubtful heart damage, which is not considered serious-systolic murmurs and doubtful enlargement of the heart, and a small group with paroxysmal tachycardia, not severe Class III includes principally patients with cardiac neuroses, extrasystoles or faint basal systolic mur-In Class II and Class III the prognosis is excellent, in the author's 423 cases belonging to these groups there was no mortality due to the heart condition Class I patients cannot be considered safe pregnancy risks, they should be sterilized In 114 Class I cases the maternal death rate was reduced from the previous hospital death rate of 18 per cent to 38 per cent and the infant mortality from 26 to 19 per cent. This reduction is attributed to an early recognition of the heart condition and to better control of the patient during pregnancy More than 90 per cent of Class I cardiacs, those furnishing the deaths, are patients with mitral stenosis These patients should be placed on a rigid regime, the main features of which are ten hours in bed each night, lying down for a half hour after meals no hurrying, climbing, lifting, or shopping Care should be exercised to avoid exposure to infection as much as possible Delivery should take place in a hospital Heart failure may be sudden and the signs few, coughing after evertion or the expectoration of a small amount of blood should be regarded as suspicious With early heart failure the pregnancy should be terminated, if it occurs at six months or later, there is a chance that by persistent hospital care the patient may be carried along until the child is viable. She should not only be expertly delivered, but should be carefully controlled for some time afterward -New England Journal of Medicine, March 29, 1928, except, 6

A Form of Senile Seizure—Hugh Barber (British Medical Journal, March 24, 1928 1,

3507) describes a form of seizure which he has seen in six apparently healthy elderly people The attack was characterized by unconsciousness, some degree of clonic spasm of the face or limbs, perhaps more pronounced on one side, followed in a few minutes by violent behavior requiring restraint. After a time the patient recovers and will say the whole incident is a blank. All the patients were between 60 and 75 years of age, with some evidence of cardiovascular degeneration, but they were robust, stout, full-blooded people There had been some degree of hyperpiesis, but no serious renal disease. In one instance anger precipitated the attack, but otherwise there had been no history of effort The patients recovered in periods varying from one to three hours, and the attacks did not recur, nor have other symptoms developed Barber believes the attack is due to slight hemorrhage on the surface of the brain, producing coma and cerebral irritation, analogous to what may be seen occasionally after concussion. In one case lumbar puncture revealed normal fluid is a vascular lesion seems probable, because of the sudden onset, and there is the analogy of epistaxis and retinal hemorrhage occurring in this type of patient. Uremia does not seem probable, the recovery is too complete, and the blood urea was not unduly high in the one case tested. The type of patient is not suggestive of epilepsy, although the analogy of a convulsion from loss of cerebral function probably holds good

The Diagnosis and Treatment of Carbohydrate Indigestion - Edward S Emery points out that, while great interest has been shown in carbohydrate indigestion in children, little attention has been given to a study of the condition in adults Failure in digestion of carbohydrates produces quite characteristic symptoms when the disorder is marked. These consist of alternating constipation and diarrhea associated with a great deal of distention and gurgling in the lower abdomen When the symptoms are severe, the stools are quite striking, the essential points in their examination being the increased amount of starch, the presence of iodine-staining organisms, and the tendency of the stools to ferment. When the process is not so active the diagnosis may be more difficult and occasionally must depend on a trial-and-error method of treatment Whenever one obtains the symptoms of an irritable colon with normally formed stools the possibility of acid stools should be considered and

investigated Many of these cases belong to the fermentative group, and the removal of starch from the diet brings about a normal reaction in the stools and a coincident disappearance of the symptoms The treatment of carbohydrate indigestion consists in the removal of all starch from the diet for a period of ten days, at which time a few slices of well toasted bread may be added If this is well borne. after three of four days the patient may take a little cereal After enough starch has been added to make the diet more palatable, it is safer to add 3 to 10 per cent of vegetables before allowing a larger amount of the pure carbohydrates Potatoes should be permitted last of all, as they are likely to produce a relapse, which makes it necessary to return to the starch-free diet for another ten days lief afforded by this treatment is striking, and in no instance has a relapse been noted -New England Journal of Medicine, March 15, 1928, cxv111, 4

The Problem of Alastrim—Professor G Sobernheim and Dr Zurukzoglu have carried out experiments intended to reveal the intimate nature of this socalled benign variola, known over much of the world under a variety of designations-alastrim, amaas, Kaffir pox, white pox, etc, etc A scab from an alastrim patient in England was used for the various tests which were carried out on the rabbit and calf like ordinary experiments in vaccinia The outbreak on the skin of the rabbit could not be distinguished from ordinary vaccinia and this was true in successive propagation to a series of rabbits and finally to a series of calves was also found that inoculation with either virus immunized against the other and this was true also of antibodies obtained from the blood At the same time the authors do not contend that the two viruses are identical or that alasrim was originally derived from true variola, such points will receive consideration later The problem is by no means so simple while alastrim often is without mortality it is well known that exceptionally its death rate is Once estimated in Brazil, the original home of alastrim, as anywhere up to 14 per cent, the death rate in the Denver epidemic of 1922 was 30 per cent, and for all practical purposes the authorities were dealing with an epi-Ordinary vaccination demic of true variola gives good protection against alastrim, although this varies considerably In Switzerland, 90 per cent of the alastrim victims had not Again, alastrim victims will seldom respond to later vaccination The basic difference between alastrim and vaccinia is the fact that it is possible for the former to undergo a mutation into true variola, although in its own right it may have a small mortality, so

that it must be extremely difficult to distinguish between the two, the more so as true variola may sometimes show a relative benignity—Deutsche medizinische Wochenschrift, March 2, 1928

Diagnosis and Treatment of Overtraining —M Brustmann and H Hoske state that the apathy, indifference, and disinclination to train, precocious fatigue, and delayed recuperation, with lowering of efficiency are the symptons usually attributed to overtraining There are, however, many more symptoms such as insomnia, marked sweating, restlessness, digestive disturbances, etc. A distinction should be made between the somatic and psychic symp toms and the latter often appear long before the former The patient may attribute his troubles to outside influences such as bad In some cases the depression is endogenous and due to the psychic makeup which is inclined to moodiness and unsteadiness. We often note the development of a pronounced aversion to the sport for which the subject is preparing himself A moody athlete may also infect the spirit of his comrades in training The prime cause of these psychic peculiarities is not overwork or poor adjustment, but simply the monotonous existence of the training camp Training does of course modify the metabolism and the nervous equilibrium. For example it increases vagotony as shown by the slow pulse, lowered blood pressure, etc, but this is all compatible with the increased functional capacity Overtraining, however, in the last analysis is equivalent to lowered functional capacity, although there are pathognomonic symptoms such as the profuse sweats, the rest lessness, and tremor on exertion Stitch in the chest, muscular cramps, anorexia, and loose bowels or constipation are often mentioned High pulse rate is sometimes seen, such as a resting pulse of 80 Another pathognomonic symptom is insomnia or troubled sleep followed by drowsiness As regards treatment, the authors are opposed to the cessation from work, save in extreme cases when the athlete may intermit for 8 to 14 days Training evercises must usually be cut down. Sugar and alkaline phosphates are useful Under dynamometric control the functional efficiency is slowly restored -Munchener medizunsche Wochenschrift, February 10, 1928

Treatment of Acute Cholecystitis—Henry Otto Bruggeman, writing in the Annals of Surgery, March, 1928, lxxxvii, 3, advises a conservative course in all types of acute inflammation of the gall-bladder, if the disease is limited to the organ and its immediate neighborhood. He compares acute cholecystitis to acute salpingitis in that it rarely kills if treated conservatively. It differs from acute appen-

dicitis in that it does not cause widespread peritonitis unless a perforation occurs early in the attack, and this fortunately is a rare As a rule operation should be avoided until signs of acute inflammation have sub-The patient, however, belongs in a hospital under the observation of a surgeon Rest, morphine, ice-packs, and the administration of large quantities of water and glucose suffice, in most instances, to limit the inflammatory process The gravest danger in this conservative treatment is the possibility of a mistaken diagnosis The author has seen acute appendicitis, mechanical ileus, and a perforated ulcer diagnosed as cholecystitis and abstention from operation practised. On the other hand, he has lost patients who were operated upon in the acute stage of cholecystitis, and he now believes they might have lived had operation been postponed When he is impelled to operate during the acute stage he usually finds the gall-bladder so damaged that he is driven to perform a cholecystectomy, even though his preoperative intention is to do a simple drainage operation, but he has not found cholecystotomy an easy operation in these cases A review of the literature shows a wide difference of opinion as to the indications for operation, and among those who advocate immediate operation there is a marked divergence of views as to the operation of choice is, however, ample support of the position that operation is rarely indicated in acute cholecystitis In mild cases it is obvious that the plan of treatment adopted makes little difference in the outcome

Meningoencephalitic Phenomena After Vaccination-Dr K. von Mallinckrodt of Elberfeld draws attention to a serous meningitis which accompanies many acute infections and was formerly hardly known, but is now recognized through the medium of lumbar puncture as present, though rarely, in mumps, pertussis, variola, vaccinia, etc But little allusion is found in textbooks to this complication, which is at times very slight in degree, amounting only to a meningeal irritation. The author has seen three severe cases in the past few years A boy of 8 was vaccinated and presented no complications for the first ten days At that time cerebral symptons developed with tonic rigidity which at first suggested tetanus although the patient was comatose Examination of the vaccination scab showed no tetanus bacilli but on account of the lockjaw the case was treated as tetanus Death under hyperpyrevia occurred on the fifth day showed edema of the brain and membranes which apparently excluded tetanus in favor of serous meningitis. The second patient was a girls of 6 years On the tenth day after vac-

cination there was a chill followed by symptoms suggestive of tuberculous meningitis, and death occurred five days later The autopsy showed simple serous meningitis The third patient was a girl of 7 who developed meningeal symptoms on the tenth day, but made a good recovery Epidemic encephalitis could be excluded by the marked meningeal symptoms and the paralyses of the ocular muscles There is of course much that is obscure in such cases and it is difficult to trace a connection between such a disease and vaccination, although for the present the writer thinks the latter must be held tentatively responsible -Deutsche medizinische Wochenschrift, Feb 17, 1928

Diagnosis of Lymphogranuloma Inguinale —H Geisler, dermatologist to the Altona City Hospital, states that despite the recent great interest in this newly isolated affection the profession in general know little of it and his own knowledge is due largely to the fact that he has seen patients from the tropics in the In all he has Hamburg Tropical Institute seen four cases, the last one in the Altona Hospital In the last-named he had a chance to test Frei's intracutaneous reaction with two control cases of chancroidal bubo, a further control test being a prick with simple saline The Frei test resulted positively for the suspected lymphogranuloma case and negatively in the cases of chancroidal bubo, while all of the control punctures with saline were negative He might have made a counter test by inoculating the two kinds of pus on the subjects with the opposite disease but this was regarded as entirely unnecessary and impracticable in routine work because of the relative scarcity of chancroidal buboes at the present In none of the author's cases was there a primary lesion on the penis, and if coitus is responsible there must in these cases have been an incubation period of several weeks pus was either sterile or contained ordinary pus exciters and the part played by the latter in the formation of the abscesses and fistulæ is uncertain. Apparently a living virus is necessary to explain the disease Conservative treatment gives very slow results, the patients remaining interned for several months only successful treatment mentioned by the author is the parenchymatous injection of iodoform-glycerin While excision is not always practicable on account of adhesions, it is the method of choice whenever the entire gland packet can be cleanly removed. In regard to the autonomy of the disease the author associates it with the strumous buboes of old time clinicians -Klinische Wochenschrift March 11, 1928

Etiology of Gastric Ulcer -In an intensive

study of ulcers and the gastric motor phenomena, Lewis Gregory Cole (Acta Radiologica, vi, 29-34), observed an interesting relationship between the sulcus angularis and the most frequent site of gastric ulcers. The sulcus angularis, a mucosal apron, which hangs down or projects about one-third the way across the lumen of the stomach between the corpus and the pyloric canal, is a functional contraction rather than an organic fold, and is therefore not easily studied surgically or by necropsy, it is best studied by means of serial roentgenology It is attached to the lesser curvature at the exact point where Aschoff says the blood supply is already taxed to its At this area about four square centimeters of mucosa are supplied with blood by about one square centimeter of gastric wall The cramping of the blood vessels, which Bergmann considers an important factor in his spasmogenic theory of gastric ulcer, is a constant factor in this apron-like fold whether or not the stomach is in a state of spasm the peristaltic sulci relax during diastole and move from one area to another during each gastric cycle, with the sole exception of the sulcus angularis Therefore the blood vessels in this region of the sulcus are kinked during diastole, in addition to the diminished blood Furthermore, the concentrated digestive secretions follow the rugæ from the fundus and impinge on the proximal surface of the sulcus angularis, which in turn deflects this secretion into the chyme in the sinus of Forssell, the proximal surface of the fold being thereby subjected to the strongest gastric secretions before they are diluted by chyme Trauma, particularly that associated with vomiting, is greatest on the proximal surface of this mucosal fold The mechanical trauma of the gastroscope, the stomach tube, and particularly the string, as employed in the string test, should be avoided The string, which has become infected during its passage through the mouth, saws its way into the sulcus angularis, thus becoming a menace to the gastric In addition, as it cuts into the sulcus, it becomes blood tinged, making the diagnosis of ulcer from this finding misleading these observations it is evident that the sulcus angularis is worthy of serious consideration as a factor in the etiology and pathogenesis of gastric ulcer

Thyrotoxic Stomach Disturbances—Professor H Curschmann refers to some intestinal symptoms of Graves's disease which have long been known, such as diarrhea, but there is no corresponding familiarity with certain stomach disorders, for some of the leading reference works ignore these while others merely men-

tion a few rare symptoms. A few of the most recent do indeed supply this omission but all of them came out in 1927 and the author was familiar with these manifestations as early as 1925 when he reported a case of recurrent vomiting of thyroid origin Had not the connection with the thyroid been established the case would have been recorded as one of hysterical vomiting Since the beginning of 1927 the author has seen four additional cases of the same severe type-simulating the stomach crises of tabes-and one of severe diarrhea The mechanism is not known but there is a tendency to the association of the gastric crises with cardiac attacks The best treatment comprises irradiation of the thyroid and thymus which rapidly relieves the vomiting and the entire Graves' syndrome responds to the same treatment, with or without the addition of other measures, such as arsenic and sedatives The resemblance to tabic crises suggests an irritation of the abdominal sympathetic which probably leads to spasm of the pylorus the author's material, however, the röntgen diagnosis was limited to the absence of ulcer and cancer and there is no special mention of any use of the screen -Münchener medizimsche Wochenschrift, March 9, 1928

Oral Sepsis - Professor O Walkoff, an oral surgeon, gives a short resume of the Anglo-American doctrine of oral sepsis as a fertile cause of systemic disease, and although he claims a German physician antedated the Americans in pointing out the association between internal disease and buccal troubles, nevertheless the idea of focal infection has never gained a foothold in Germany, where the claims of Rosenow and others are regarded as quite without warrant, especially since they It is at least lead to wholesale extractions possible he says, to treat these teeth conserva-We may regard infected teeth as suspicious but we have not got the proofs against The author's method he calls strictly medicinal—that is there is no apicectomy or operation of any kind, the roots being treated entirely through the pulp cavity. He claims to show by rontgenograms that large granulomata have been made by this means to dis appear from the apical region. If a fistula is present in the jaw this will close of itself after treatment of the focus Thus the teeth are retained for cosmetic and functional purposes, infection is destroyed, and the bone The treatment may defect is regenerated The author's technique require a long time need not be described, as it is inferior to that of some of our own conservative dentists who add to ordinary resources the use of electrical sterilization, the violet ray, etc - Deutsche medisimsche Wochenschrift, March 16, 1928

By LLOYD PAUL STRYKER, Esq Counsel Medical Society of the State of New York

STATUTE LAW

The third of our promised series of editorials is herewith submitted Statute Law

The word "Statute" has been defined by Bouvier as "A law established by the act of the legislature The written will of the legislature solemnly expressed according to the forum necessary to constitute it the law of the State"

Another standard work has defined the term "Statute" as "The written will of the legislature, rendered authentic by certain prescribed forms and solemnities, prescribing rules of action or civil conduct, in respect to either persons or things, or both" The term "Statute Law, 'according to the same authority is "Frequently used interchangeably with statute, but the term is broader in its meaning, and includes not only statutes as already defined, but also the judicial interpretation and application of such statutes"

Under our form of government, national statutes are enacted by the Congress of the United States, state statutes by the legislature of the State.

Under the United States Constitution "Every bill which shall have passed the House of Representatives, and the Senate, shall, before it becomes a Law, be presented to the President of the United States, if he approves he shall sign it, but if not he shall return it with his objections to that House in which it shall have originated, who shall enter the objections at large on their Journal, and proceed to reconsider it. If after such reconsideration twothirds of that House shall agree to pass the bill, it shall be sent, together with the objections, to the other House, by which it shall likewise be reconsidered, and if approved by two-thirds of that House it shall become a But in all such cases the votes of both Houses shall be determined by year and nays, and the names of the persons voting for and against the bill shall be entered on the Journal of each House respectively If any Bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a Law, in like manner as if he had signed it, unless the Congress by their adjournment prevent its return in which case it shall not be a Law"

The same section of the Federal Constitution provides that "All bills for raising revenue

shall originate in the House of Representatives, but the Senate may propose or concur with amendments as on other bills"

The powers of the national Congress with respect to legislation are specifically set forth in the constitution. The matters upon which Congress is authorized to legislate are the laying and collecting of taxes, and the providing for the common defense and general welfare of the United States, the borrowing of money, the regulation of commerce with foreign Nations, and among the several States, and with the Indian Tribes, the establishment of a uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States, the coining of money, regulation of the value thereof, and of foreign coin, and the fixing of standard weights and measures, the making of provisions for the punishment of counterfeiting the securities and current coin of the United States, the establishment of Post Offices and post roads, the promotion of progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries, the constituting of tribunals inferior to the Supreme Court, the punishing of Piracies and Felonies committed on the high seas, and offences against the Law of Nations, the declaration of war, granting of letters of Marque and Reprisal, and the making of rules concerning captures on land and water, the raising and supporting of armies, but no appropriation of money to that use shall be for a longer term than two years, the maintaining of a Navy, the making of rules for the government and regulation of the land and naval forces, the provision for the calling forth of Militia to execute the Laws of the Union. suppress insurrections and repel invasions, the providing for organizing, arming, and disciplining the militia, the exercise of exclusive legislation over territories and the District of Columbia, and lastly, and perhaps the most important of all this general grant of power is given by the Constitution to the Congress "To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof "

It is under this last blanket clause that au-

596 LEGAL

thority in the National Congress to pass laws not provided for in the specific grants of power has been found. Thus, for example, in the early days of the Nation, the question of the right of the Federal Government to charter and organize a bank of the United States was contested on the ground that no specific power to legislate on this subject was given, but it was held that the organization of a national bank fell within the general authority to make laws "which shall be necessary and proper in carrying into execution" the specific powers of legislation granted

The provision of the New York State Constitution with regard to the legislative powers of our State Legislature is almost identical with that laid down by the Constitution of the United States as to the powers of Congress But there are provisions in the State Constitution which are not found in the Federal The first is that "no bill shall become a law after the final adjournment of the legislature, unless approved by the Governor within thirty days after such adjournment" Thus, in the National Government an adjournment of the Congress before the expiration of ten days after the presentation of a bill which the President had not signed defeats the passage of the law In the State, the adjournment of the legislature does not defeat the passage of any such bill provided the Governor approves of it "within thirty days after such adjournment"

Another difference between the two Constitutions in the matter of law making, lies in the fact that the President must either sign or veto a bill of Congress (unless he permits ten days to lapse before an adjournment, thereby causing the bill to become a law) Under our State Constitution, however, the Governor is authorized where the bill contains several items of appropriation of money, to veto one or more of such items although approving of the other portion of the bill If the Governor does veto one or more such items, when the bill is returned to the legislature with his veto, it may reconsider the same and if it approves of the items by two-thirds of the members of each House the items vetoed become part of the law "Notwithstanding the objections of the Governor"

One of the most interesting differences between the powers of our State Legislature and the powers of Congress with respect to legislation, lies in the fact that under our State Constitution it is specifically provided that "No private or local bill which may be passed by the legislature shall embrace more than one subject and that shall be expressed in the title" No provision of this kind is found in the National Constitution, with the result that many acts of Congress contain "Riders" that is, provisions which are not germane to the

general purposes of the act and which are inserted in the hope that the President, rather than veto the entire bill, will permit the passage of this added provision in no wise connected with the general nature of the action The effect of such a practice is known to everyone, it has produced and stimulated "log-rolling". The history surrounding the enactment of this provision of the State Constitution is interesting In 1791 the Bank of New York obtained a charter giving it a practical monopoly of the banking business in the City of New Its stockholders and directors were Federalists, with Alexander Hamilton at their head In the course of time the bank came to wield what was believed to be a controlling political influence, and Aaron Burr conceived the idea of organizing a rival bank. The legislature at that time, however, was in the hands of the Federalists and bank charters were granted as a matter of political favor There had been a scourge of yellow fever and in this Mr Burr saw his opportunity He petitioned for the charter of a company, the purpose of which was to afford an abundant supply of pure and wholesome water The capital of this water company was two million dollars, but as it was probable that the construction of the water works would not absorb the whole of that sum, Mr Burr caused to be inserted in his charter a seemingly innocent provision that the "surplus capital might be employed in any way not inconsistent with the laws and Constitution of the United States or of the State of New York" When the charter was granted Burr used the authority of this grant for the organization of one of the strongest banking institutions of the City, and it is still in exis-The precedent which Burr set was followed, or was attempted to be followed on many subsequent occasions, until finally the constitutional convention in 1846 inserted in the Constitution the provision that no private or local bill could embrace more than one subject, and declared that such subject must be expressed in the title

The New York State Constitution does not (as does the Federal) define the specific subjects upon which the legislature is authorized The legislature's power of legisto legislate lation is contained in this brief grant "The legislative power of this State shall be vested But the State in the Senate and Assembly" Constitution forbids the legislature from passing private or local bills, changing the names of persons, laying out or discontinuing roads, locating or changing county seats providing for changes of venue in civil or criminal cases incorporating villages, providing for election of members of boards of supervisors, selecting, summoning or impaneling grand or petit jurors, regulating the rate of interest on money

opening and conducting of elections or designating places of voting, increasing or decreasing fees, percentages or allowances of public officers during the term for which they are elected or appointed, granting to any corporation, association or individual the right to lay down railroad tracks, granting to any private corporation, association or individual any exclusive privilege, immunity or franchise whatever, granting to any person, association, firm or corporation, an exemption from taxation on real or personal property, and providing for the building of bridges (with one exception)

The State Legislature, however, is authorized to pass "General Laws providing for the cases enumerated in this section, and for all other cases which in its judgment may be

provided for by general laws"

With the exception of these prohibitions, the State Legislature may pass any law which does not conflict with the State or Federal The Congress of the United Constitution States, however, has not the general power to legislate, but has only such power as is expressly granted by the Constitution, and though the Federal Constitution does not contain some of the salutary restraints upon legislation by which the State Legislature is circumscribed, the Federal Congress is specifically prohibited from passing laws for the suspension of the writ of habeas corpus, except where in cases of rebellion or invasion, the public safety may require it, from passing bills of attainder or ex-post facto law, from passing capitation, or other direct taxes, unless in proportion to the census, from enacting taxes or duties upon goods exported from any State, from giving preferences by any regulation of commerce or revenue to the Ports of one State over those of another, or from causing money to be drawn from the Treasury except in consequence of appropriations made by law, and from granting titles of nobility

This in a very brief way, suggests some of the powers and limitations upon legislation imposed by our Federal and State Constitutions. But these restrictions and the restrictions of the various Constitutions of the several States do not prevent forty-eight State Legislatures and the National Congress from enacting every year a mass of Statute Law so large, so ponderous and so complex, that no one human mind is capable of grasping or understanding all of it Some of the Statutes which are passed are wise and farseeing, some are passed upon an intelligent conception of the needs of the community, and some are not

Under our government the people do not personally enact their laws, but select representatives in the persons of State assemblymen and State senators, National representatives and Senators of the United States to do

How well or how poorly this work for them it is done depends upon the character, training, ability and experience of the legislators which the people choose. In the last analysis then. criticism for unwise and unworthy legislation rests upon the shoulders of the people themselves. We get as good laws as the legislators whom we delegate to perform this work, enact for us No better and no worse A State Legislator should be actuated by the interests of his State and should be able to think in statewide terms A national legislator should have a nation-wide conception of his duties how seldom is this the case, is a matter of all too-common knowledge! Too often the assemblyman is concerned only with the interests of his assembly district, or a representative in Congress with the promotion of the interests of his particular constituents,—the affairs of his particular Congressional district Much is said and justly said in criticism of the character of much of our legislation Much more is said and should be said of the undue proportions to which the Gargantuan mass of State and Federal Legislation has now swollen, and almost nothing is done about it

Ours is in theory a representative government. It may be made representative at any time. Often it is not representative for the reason that the individual citizen takes no interest whatever in the nomination or election of the best man capable of performing the duties which they are delegated to perform. One of the results of this is found in the constant necessity of construing the meaning of the words and phrases of the Statutes. Were the decisions of all the Courts of the Nation and the States to be examined, a surprisingly large proportion of these decisions would be found to relate to subjects of this kind.

But as has been pointed out in one of our previous editorials, there is one salutary restraint upon the law-making power in this country which is not found in England, and that is the power of the Courts to declare a law unconstitutional. If a Statute violates a provision of the State or Federal Constitution the judiciary has the power to nullify it

The study of Statute Law today is one of the largest and most complex of the duties devolving upon a lawyer. Before he can properly advise his client as to the merits of the case, he must examine and consider each Statute which has any bearing or might be determined to have any bearing upon he facts in hand. After he has done this he must understand in what way the particular words of the Statute have been construed by the Courts, and if those particular words have not been judicially construed, he must construe them himself. He must ascertain whether or not

598 LEGAL

the Courts have expressed themselves with regard to the Statute which he is considering Often he is called upon to determine whether or not a Statute is or is not constitutional, that is to say, whether the law in question violates any of the rights of his client accorded by the Constitution Where he has become convinced

that this is the case, he must in Court champion the rights of his client by challenging that which the legislature has enacted

Far too many laws are passed Unwise statutes are enacted This evil grows worse instead of better The remedy lies with the people who nominate and elect their legislators

CLAIMED NEGLIGENT CURETTAGE

Here it was charged that a surgeon was negligent in the performance of an operation upon his patient in that he had failed to remove a dead child from the plaintiff's womb, that by reason of such negligence the patient suffered severe pain and anguish and her nervous system was affected and her body generally and particularly the womb. She claimed she was confined to her bed in a hospital for four weeks and to her home for many months. That she was obliged to submit to a further operation upon her womb and incurred medical, hospital and other expenses, and sought by this action to be compensated for such injuries.

About June 20th the plaintiff had called on the defendant physician at his office and informed him that her family physician had stated that she was pregnant. That about three years prior to this time she had been operated on for cancer of the rectum and because of that fact and the probable dangers to her of pregnancy, the family physician had advised that the present pregnancy be terminated. The history of the patient showed that her menstrual periods were regular until about three weeks prior to the time she was first seen by the defendant physician, that that menstrual period had been missed and she had not menstruated since

By palpation and digital examination the defendant examined the patient's abdomen, vagina and womb Upon further examination he found a colostomy in the lower left part of the abdomen There was no evidence of an anus, the entire lower portion of the bowel having evidently been removed at the previous operation. The defendant found that the prior operation had so distorted the organs of the pelvis that it was very difficult to adequately palpate the uterus through the vagina The uterus appeared to be moderately enlarged to about the size of a six month pregnancy The defendant felt that the above findings indicated and confirmed the opinion of the family physician that a therapeutic abortion was indicated He then conferred with the family physician and an operation was arranged for, to be performed upon the plaintiff at her home, the family physician assisting at that time, also another physician who administered the anaesthesia

When the patient was sufficiently under the anaesthesia the defendant performed the necessary operation for a therapeutic abortion, he having previously sterilized himself and all his instruments likewise being sterilized. The cervix was grasped with a pair of bullet forceps. Due to the previous operation the cervix and uterus were situated much higher and more posterior and to the left than usual The cervix was dilated with difficulty owing to the presence of a small growth in the anterior wall of the uterus The uterine canal was further distorted. After adequate dilatation of the cervix with a dilator, the uterine cavity was curetted with a sharp curette Owing to the distortions present a small portion of the anterior wall behind the growth could not be reached by the curette and to reach the same it would have been necessary to make an incision through the cervix, which procedure was counter-indicated at that time After the operation was completed the patient was returned to her bed The defendant and the other physician remained with the patient until she had complete-She was left in ly come out of the anaesthesia the care of the family physician

The defendant saw the patient again about four days later, at which time she was doing nicely. She was not again seen by the defendant until about a month later, when she called on him at his office, stating that she had failed to menstruate since the operation. Upon examination, the defendant found that the uterus was only moderately enlarged and he advised the patient at that time to return to him in about three weeks. She never returned to the defendant surgeon and nothing further was heard from her until the malpractice action was instituted.

This action eventually came on for trial and was submitted to the jury which rendered a verdict in favor of the defendant thus successfully terminating the action in the surgeon's favor

LONDON LETTER

LONDON LETTER

London has been much occupied during the last weeks of February by the celebration of the bicentenary of the birth of John Hunter. When little Jock opened his eyes on the world in the poor farm house at Long Calderwood, on February 13, 1728, there was little to show that before his death in 1793, this wee infant would transform the whole scientific aspect of Surgery, and earn for himself immortality Fate wraps up her gifts so cunningly that many must remain unrecognized and unaccepted, but rarely, perhaps, has a supreme gift been offered to mankind more unassumingly Dr William Cullen, the local country doctor, paying an ordinary visit to Hunter's parents, asks the father what he purposes to do with William, the elder of the two brothers, and Mr Hunter replies that he hopes to get him into the Church—the highest ambition of the Scottish middle class of that time Cullen offered to take William as his assistant, and the hand is stretched out to seize the gift of Fate. Had mankind known how much depended on the father's answer, all Nature would have held its breath to listen So William goes as assistant to Cullen, develops his wonderful skill as an anatomist and teacher, and then to London invitation to John to join him follows, and the stage is set. There is still difference of opinion as to which of the three, Dr William Cullen, Dr. William Hunter, or John Hunter, was the greatest man, all three became famous, and if John has received the hon's share of honor, at least it is well bestowed, and amazingly deserved

The general discussions at the various Medical Societies in London have covered a wide range of subjects, and of these not the least interesting were the discussions on Pernicious Anæmia at the Medical Society of London, where the value of the Liver Diet, which we owe to Minot and Murphy, was demonstrated, and on Chronic Appendicitis in Children at the Royal Society of Medicine

We have been fortunate to have as visitors this winter two famous Americans. Dr. Vincent Lyon of Philadelphia addressed the Medical Society of London on the uses of the Duodenal Tube in Diagnosis and Treatment, and Dr. Howard Kelly came from Baltimore to deliver the Hunterian Lecture to the Hunterian Society, choosing for his title "Rubbing and Reasoning" Dr. Max Cheval is to demonstrate his method of Radium treatment of Cancer of the Cervix Uteri in the near future. These visits from neighboring countries are much appreciated and are especially valuable as a means of keeping the medical

profession in touch with the trend of modern thought

Among modern methods of treatment perhaps none has caused more interest than the treatment of cancer of the mouth and tongue by radium. The staff of Westminster Hospital have been much interested in this branch of work and a demonstration recently given at that institution showed how remarkable has been the advance in this form of attack upon the scourge of malignant disease.

A hurried visit to Paris gave the writer an opportunity of seeing Dr Pauchet at work and this eminent French surgeon in a short conversation emphasized the tendency among some surgeons of the present day to treat duodenal ulcer with high acidity by partial gastrectomy. He evidently approves of this principle and more will be heard of it

Two problems have come much to the fore lately in regard to London hospitals The first is the question of accommodation for paying patients, that is, for people of moderate means: the second is the decision of certain hospitals to exclude women students During the war hospitals which had hitherto taken only men students opened their doors to women, but the tendency since the Armistice has been gradually to withdraw this privilege. Within the last week the matter appears to have reached a head by the decision of three more London hospitals to exclude women in future It is a highly controversial question, and is still under discussion

Illness nowadays is one of the most serious handicaps that can be imposed on men and women earning their livings. The growing compulsion for people to live in flats or limited accommodation makes it impossible for any but slight illnesses to be nursed at home, and the prohibitive prices for rooms in nursing homes, to which must be added medical fees and nursing charges, render it equally difficult for patients to leave their own houses Everything is done for the sick poor, and everything is obtainable by the wealthy as regards medical attention and accommodation, but between these two extremes is a huge middle class, mostly head workers, for whom up to now little has been done. Certain hospitals have set aside paying wards for this class of patient, but even their charges seem rather high for moderate There is some talk of building special ıncomes hospitals for these paying patients but the cost of construction and maintenance is so heavy that at present the scheme seems unlikely to materialize.

H W CARSON, FRCS, MRCS LRCP

NEWS NOTES

GOVERNOR SMITH AT THE ANNUAL MEETING

The Committee of Arrangements for the Annual Meeting has announced that Governor Alfred E Smith has accepted the invitation to be the guest of honor on Tuesday, May 22, at the annual banquet of the Medical Society of the State of New York in Albany

Governor Smith is the friend of physicians and the upholder of scientific medicine. The members of the Medical Society of the State of New York will be glad to welcome him, and to show their appreciation of his services to public health.

MANUFACTURERS' SESSIONS

Many exhibitors of commercial products at the annual meeting of the Medical Society of the State of New York have interesting things to say about their products, and some have moving pictures illustrating the production and use of their wares. Some of the talks and pictures have been given before scientific societies and have been proven to have an educational value. The managers of the exhibit have therefore invited a few of the exhibitors to give their talks or show their pictures in a room specially provided for them facing the exhibitor's booths.

This provision for the exhibitors is an original and unique feature of the annual meeting. It is an experiment without precedents for guidance, but those taking part have submitted outlines of their addresses and pictures, and have given proof of their high ethical character and educational value. The program is as follows

MANUFACTURERS' SESSIONS

Lectures, Demonstrations and Pictures by Commercial Exhibitors

Place, Main Floor of the Armory

Program

Tuesday, May 22

(a)—11 a m -12 m — Moving pictures, by E R Squibb & Sons Immunity and the products that protect (b)—3-4 p m—The story of two Vitamines in their relation to health and growth (Cod Liver Oil)

Wednesday, May 23

- 1000 a m—The Meaning of Illumination and Transillumination in Diagnosis and Surgery Talk by W P Schmid, of the Cameron's Surgical Specialty Company, Chicago and New York
- 10 15 a m—Illustrated talk, cod liver oil as a factor in child growth and health, by Daniel R Hodgdon, MD, of the H T Dewey & Sons Company, New York
- 10 30 a m—Klim as a Basis for the Whole Milk Formula, by Gerald Milot, of the Merrell-Soule Company, Inc., New York and Syracuse
- 1045 a m Valve Tube Rectification in X-ray Machines By Joseph F Zauner, of the Wappler Electric Company, New York
- 200 pm—Motion Picture illustrating the use of Dryco Milk, by the Dry Milk Company, New York
- 215 pm—Ultraviolet Light Lamp A talk of E B Smith, of the Hanovia Chemical and Manufacturing Company, Newark, N J
- 230 pm—The Pollenair Filter and how it removes pollens from respired air, by F H Wilberding, of Pollenair, Inc., Cleveland, Ohio

REPORT OF COMMITTEE ON NURSING AND NURSING EDUCATION

To the House of Delegates-

Gentlemen

Your committee reports that its investigations confirm the conclusions expressed last year. While there appears to be no shortage of nurses, their distribution in rural communities is faulty in spite of improved roads and increased motor serv-

ice, which should improve the availability of

From the viewpoint of demand, distribution and of supply the question is acutely economic

The patient's demands, never budgeted in advance, are met by an adequate supply but at a cost which is usually difficult or impossible to meet for the amount of service which the patient thinks he needs

Members of your committee have carefully observed the nursing of private patients during the past year and report that except in acute conditions they found full time twelve hour nurses very frequently unoccupied—sitting around for hours at a time. Good nurses reported this mactivity very tiresome and in the home sought relief in some household duty and in the hospital loaned themselves to assist other nurses in difficult cases.

Home nursing is the most difficult to manage As long as statistics continue to show that 95 per cent of American housewives do their own housework, when this responsible person becomes sick, it will be imperative that the nurse adjust

herself to a very elastic service

Part time nursing of one or two or four hours daily is often all that is needed in addition to directed observation and attention by some willing member of the family. Such a service might cost one or two or four dollars daily and be within the financial ability of the patient. While our present standards of living continue we cannot expect an educated specially trained person to work in the house for the fifty or sixty cent an hour wage of the uneducated scrub woman or laundress.

In the hospital it would seem to be perfectly feasible for the nurse to work eight or ten or twelve hours steadily, allocating the cost of eight or more dollars over a number of patients—the number varying according to the quality and

quantity of service needed

Visiting nurses are doing splendid work and are gradually extending their field in homes for privately paid service as a knowledge of their availability grows. Physicians could help by educating their patients as to the possibilities of part time service in homes and in hospitals and very often in hospitals by assuring their patients of the adequate care rendered by floor nurses.

Physicians complain that the cost of nursing to the patient absorbs more than his available finances—so that at the end of an illness the payment for medical service is indefinitely postponed or never met. It would seem that group nursing in hospitals might work to the advantage of all three—the patient to pay less—the nurse to work shorter hours at larger wage—and the physician to get his fee

The work of the Utica Visiting Nurse Association herewith illustrated* shows the progress of this part time service slowly reaching the knowledge of the public—and, we are told, with the entire approval of the physicians and nurses of that city

Physicians continue to complain that nursing education tends to develop physicians' assistants and technicians rather than nurses who are willing to assume all of the care of the sick individual. They also complain of public health nurses and

others—practising medicine—making diagnoses—carrying stethoscopes—and other paraphernalia which serve to impress lay people with their scientific equipment—prescribing remedies, advising operations, referring patients to physicians or specialists without consulting the family physician, thereby discrediting the nursing profession in the eyes of practitioners of medicine and incidentally fermenting discord between physicians and lay organizations which these nurses sometimes represent, thus defeating the best interests and purposes of otherwise helpful agencies

Hospital heads still complain of burdensome demands for housing nurses, and training school heads complain of unreasonable loading of curriculum particularly in subjects for which a small service requires affiliation with other

schools

Even in large cities the number of children hospitalized is so small, in one city less than 1 per cent for all causes, that there is very little general experience, especially in handling medical cases. It would seem that experience in nursing the surgical child would be reasonable qualification for nursing any type of child patient and in small towns outpatient nursing of children in their homes might replace affiliation for Pediatrics in distant cities of New York or other States.

Preventive medicine, preventive vaccinations, general dissemination of health knowledge to the lay audience through public schools—through press and radio broadcast—is in our opinion influencing the incidence of disease among children to such an extent that hospitalization of

children will continue to decrease

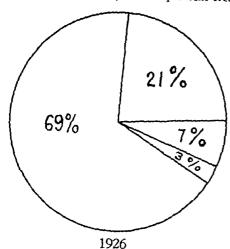

Your committee feels that affiliation for all causes should as far as possible be eliminated from the training of the basic nurse because it embarrasses the small school and disturbs the normal essential development of the nurse Your committee's definition of the Basic Nurse in our report of last year—"The basic nurse is a graduate who has completed a general hospital training school course in the theory, practice and art of nursing in two years, is fitted to nurse patients either in a hospital or at home and is eligible for the degree of Registered Nurse" may well be modified, in the light of the knowledge of the over-supply of nurses, to require longer terms of study by the minimum requirement of four years in high school-this to include all of the didactic teaching within the high school, giving all of the time of service in the hospital to the teaching of the art of nursing by demonstration and practice

The training schools have difficulty in securing and retaining competent teachers for financial reasons. This condition might be remedied by the use of high school teachers or others especially prepared to give competent instruction in the basic sciences in a pre-training school course.

Your committee feels that a basic fundamental standard should be reached to consist in large

^{*} See page 602

BEDSIDE CARE OR TREATMENT VISITS The per cent paid for, and the per cent free.

6% Paid in Part by Patients

28% Free

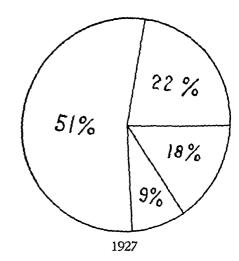

measure of training in the art rather than in the science of nursing and that there should be the same basic standard in all of the states-whether in New York, New Jersey or Missouri Your committee believes that fundamental training is necessary no matter what the nurse's specialtythat opportunity should be provided for develcoment in any line-but only after completion of the basic course

Your Committee finds the State Department of Education co-operative and open-minded on all questions affecting the practice of medicine as related to the practice of allied professions and eager to learn the irreducible minimum for the

number of nursing schools for basic educational requirements and for affiliations

The Registry Bill enacted last year has been generally well received-but has not been long enough, nor strictly enough enforced to make itself properly understood. This law is in the interest of the public in preventing unqualified or immoral persons undertaking nursing service, and through identification, protecting the qualified nurse from impersonation by unregistered incom-

The nurse rightly views the future of her profession with dismay—as she sees the increasing output of an increasing number of training

18,000 nurses were graduated in the United States in 1927 and 4,000 are now in training in the State of New York alone 4,000 physicians were graduated in the United States in As the Grading Committee discovers in the answers to questionnaires by over 40,000 physicians, that the average physician employs only one or one and a half nurses at one time, the ratio of last year's graduation of four and onehalf nurses to one physician if continued, promises still more serious financial embarrassment If the present ratio of increase in nurse graduation continues the Grading Committee estimates that 60,000 nurses will graduate in 1965 are now 2,096 training schools in the United States-139 of them in New York, and more are being organized The private duty nurse now works only eight months of the year and her average yearly wage is \$1,300 The Public Health nurse works twelve months and averages a yearly salary of \$1,700. The institutional nurse works twelve months of the year and averages \$2,000 A few special part time nurses in New York City make \$5,000 a year by dividing their services among several patients. More than half of all nurses are in private duty service and 45 per cent of these private duty nurses plan to seek some other form of work, chiefly because of long periods of unemployment, and there seems to be a steadily lessening prospect of improvement

The immediate remedy would seem to lie only through better distribution of the present supply, through cutting down the number of nursing schools, and limiting the number of students to be

accepted

Some of the schools of nursing seem to be conducting schools merely because they need the services of the nurses in the hospitals and report that they would have to close the institution if they could not get student nurses. It is impossible to deny the seriousness of the situation

Graduate nurses must take care of themselves in a businesslike way, must either attain the upper and better paid fields of institutional and public health service, or they must plan to sell their time or special ability at prices the patient can afford in a flexible manner that will give them a decent living and possible provision for their old age

While your committee finds the nurse problem increasingly difficult of solution it feels the importance of suggesting ways and means which may be helpful to the sick—to the nurse—to the physician

Your committee recommends

- 1 The establishment of official registries which shall be endorsed by the county medical societies and conform to the requirements of the registry law
- 2 The stimulation of the coordination of all nursing service in each county
- 3 The encouragement of hourly, part-time or group nursing
- 4 The extension of the visiting nursing service
- 5 That didactic teaching in the basic sciences be given in the high schools—where the teachers are, and all hospital training be devoted to training in the nursing arts
- 6 That four years of high school be the minimum requirement to enter schools of nursing
- 7 That the number of training schools be reduced
- 8 That affiliation be as far as possible eliminated

REPORT OF COMMITTEE TO STUDY THE CURRICULUM FOR NURSING EDUCATION IN THE STATE OF NEW YORK

To the House of Delegates— Gentlemen

Your committee has met and has begun the study of the curriculum for nursing education in this State and reports that a very satisfactory entente has been established with the Department of Education of the State of New York. That the work is going on but is not sufficiently advanced to be reported on at this time.

Your committee recommends that this study be continued for another year

Respectfully submitted,

Presbyterian Hospital New York

REPORT OF COMMITTEE ON IMMUNIZATION OF CHILDREN AGAINST DIPHTHERIA

To the House of Delegates—Your Committee presents the following

Progress Report

of the Second Year of Diphtheria Prevention In New York State, Exclusive of New York City

 January 1, 1927 to January 1, 1928

 Number of
 1927
 1926

 Children
 217,000
 110,000

 Inoculated

The complete tabulation of children inoculated against diphtheria in the State during 1927 shows approximately an increase of 100% over 1926. This number represents only those treatments reported to the State Department of Health. It is estimated that between 25,000 to 35,000 children have been treated chiefly by private physicians in their offices, for which reports have not been received.

Units of	1927	1926		
Toxin-Antitoxin				
Distributed	1,119,095	750,000		

The free distribution of toxin-antitoxin by the State Laboratory increased 50% during 1927

Diphtheria Cases and Deaths

In common with states throughout the country, New York State shared in an increased prevalence of diphtheria during 1927 Studies by the United States Public Health Service, Metropolitan Life Insurance Company and the State Department of Health shows clearly that diphtheria tends to follow a seven-year cycle and that 1927 was in many states the peak year of a cycle

1 Apparently the State Campaign has not been carried on sufficiently long to prevent a diphtheria epidemic year but that it had a part in keeping down the increase in diphtheria cases and deaths over what it otherwise would have been is indicated by the following summary

Total 1927 1926

Cases 3,928 3,647 an increase of 321 cases—8%

Deaths 255 251 an increase of 4 deaths—1½%

- 2 Thus it will be seen that both the increase in cases and deaths during the year was comparatively small. One of the most significant points gleaned from last year's experience was that of the 255 deaths only three children had received toxin-antitoxin inoculations. In other words, the deaths from diphtheria occurred in the non-treated group
- 3 Diphtheria cases increased 73% in New York City during 1927, as compared with 8% in the area of our campaign, that is, the State, outside of the Metropolis, diphtheria deaths in-

creased 47% in the city, as compared with only $1\frac{1}{2}$ % in the rest of the State

4 Dr William H Park stated recently that he considered the more favorable record for New York State could be directly attributed to the intensive prevention work of the past two years, whereas, in New York City, immunization work had greatly dropped off during this period

Campaign Extends Nationally

- 1 The Saturday Evening Post in an editorial September 3, 1927, carried a strong commendation of the campaign to its several million subscribers. Likewise, editorial comment and stories have appeared during the year in the Woman's Home Companion, the Ladies' Home Journal, Pictorial Review, Good Housekeeping, Poster, and Children—The Magazine for Parents
- 2 A publicity session of the Twentieth Annual Meeting of the American Public Health Association at Cincinnati was given over entirely to a detailed report of the New York State Diphtheria Prevention project and to consideration of the publicity material which has been developed
- 3 Diphtheria prevention literature and posters put out by the State Committee are now receiving wide distribution to health officers throughout the country. A number of posters and leaflets have been ordered for a campaign in New York City, during 1928

Progress in Organization

- 1 Health officers in nine second-class cities of the State were called together by the State Commissioner of Health in November to urge their more intensive effort to secure the immunization of pre-school children
- 2 County medical societies and individual practitioners throughout the state continue to take part in local undertakings and the number of immunizations done by physicians in their private offices show marked increase
- 3 Albany, Peekskill, Middletown, Salamanca, and Utica, were among the cities which conducted creditable community campaigns during the year
- 4 Use of the house-to-house canvass to persuade parents to have their children immunized was shown to be an essential part of efforts to secure protection for pre-school children

Publicity Promotion

Special items of interest in the State Committee's program in respect to publicity include the following

Publication of Handbook No 2, "Preventing

Diphtheria "

Securing pledge from General Outdoor Advertising Company of \$25,000 worth of billboard space free

Distribution of a quarter of a million pieces of

diphtheria literature

Publication of new posters and leaflets, as well

as foreign language material

175,000 buttons ordered for distribution to children when they receive the third toxin-antitoxin treatment

3,300 clippings of liphtheria news stories and editorial reviews from the newspapers

Emphasis During 1928 will be directed to securing the more intensive inoculation of preschool children in the cities upwards of 50,000 in population by

- 1 Sending special organizers to such cities to assist the health authorities in organizing community action, and a house-to-house canvass to persuade parents to have their children treated
- 2 Publishing a handbook of instructions for this type of effort.
- 3 Enlisting the cooperation of various women's organizations, civic clubs, and fraternal bodies
- 4 Promoting a diphtheria prevention poster contest in high schools and normal schools

Your committee invites the studious attention of every delegate to the following statistics with the hope that through his increased interest every district will show marked improvement during 1928

TOTAL NUME STA			TIONS IN N YORK CITY	
State (Exc. Over 10,000 Under 10,000	•			15,269 13,445 1,824

The protection of at least 300,000 children against diphtheria each year for the next three years by means of toxin-antitoxin treatments is the goal for the completion of the five-year State campaign, outside of New York City, by the State Diphtheria Campaign committee

The effort to wipe out diphtheria in the state is supervised by a conference committee meeting

monthly, and representing the State Departments of Health and Education, State Medical Society, Metropolitan Life Insurance Company and the State Committee on Tuberculosis and Public Health and also President Sadlier

Your committee believes that the progress of immunization against Diphtheria is creating a growing sentiment for preventive medicine among all classes of our citizens, that the general public is now looking toward the physician for leadership in public health activities as never before, and that an appreciation of the immediate importance of preventive inoculations will furnish the physician of the future with a wonderful field for an increasingly active use of the talents which his education has developed

Your committee recommends increased activity in Diphtheria prevention by every County Society through special committees and through stimulation of the personal responsibility of every member for the success of this work

Respectfully submitted,

NATHAN B VAN ETTEN, Chairman

THE SPRING ASSEMBLIES OF THE POST GRADUATE MEDICAL ASSOCI-ATION OF NORTH AMERICA

The Inter-state Post Graduate Medical Association of North America will hold a series of spring assemblies from May 17 to June 9, in some of the larger western cities having clinical facilities and means of entertaining several hundred physicians. The Association is well organized with Drs. William and Charles Mayo as prominent leaders. Dr. Lewellys F. Barker of Baltimore is president, and Dr. W. B. Peck, Freeport, Illinois, is managing director.

The Association conducts three series of assemblies annually

- 1 A tour of American Medical Centers in the late spring
- 2 A tour of Enropean Clinics during the summer
- 3 An Annual Assembly in the fall—this year in Atlanta, Ga

The spring tour to American centers will start from Chicago on the night of May 16. The members will travel in Pullman cars which will be available throughout the trip About two days will be spent in each center, and travel will be by night so far as possible. The program of each day will consist of clinics beginning early in the morning and lasting until noon. The afternoons will be given to pleasure and side trips. Any physician may enroll for the trip and may take his wife.

vision will be made for the entertainment of the ladies at each center

A physician wishing to enroll will buy a ticket which includes practically all his expenses, including botel bills, during the tour of nearly one month. The cost from Chicago and return to that city will be slightly more than five hundred dollars.

The itinerary is as follows

Leave	Chicago	May	16
"	St. Louis	"	18
11	Nashville	"	21
44	New Orleans	**	
44	Dallas	"	23 24
45	Los Angeles	**	28 30
# 6	San Francisco	"	30
ee	Seattle	June	1
**	Portland	· u	2
"	Denver	"	2 5 7
"	Omaha	11	7
"	Rochester, Minn	"	9
Arrive	: Chicago	cc .	10

Arrangements may be made to attend the meeting of the American Medical Association at Minneapolis beginning on June eleventh Several hundred physicians are expected to take the trip Dr Frederick P Reynolds will represent the New York Academy of Medicine on the tour

SOCIETY ACTIVITIES IN THE SIXTH DISTRICT BRANCH

Dr Wilbur G Fish, President of the Sixth District Branch, sent a questionnaire to the Secretaries of the Counties of the Sixth District Branch, in order to obtain a report of the activities of the societies for the year ending February 1, 1928 The points of the questionnaire were as follows

- 1 Postgraduate courses given and arranged for
- 2 Public Health work, viz, Clinics, T B work, Toxin-antitoxin work, Child Welfare, County Public Health Committee, Nurses, etc

3 Scientific papers read at meetings other

than Postgraduate meetings

4 Increase of members due to notices sent to non-members of Sixth District Branch meeting

5 Any other activities of your Society

The Tompkins County Medical Society reported as follows

- 1 Postgraduate course now being given in Physio-therapy One on Diagnosis of early T B being arranged for
- 2 Three active members on County Health Committee
- 3 Subjects Prevention of Cancer Bronchiectasis The Cause of Pain in Pleuritis Chest Surgery Traumatic Lesions of the Nervous System and Increased Intracranial Pressure

4 No increase in membership

5 Study of the County Health Unit System of Public Health Work as applicable to Tompkins County

Public meeting on the subject of Prevention

of Cancer

Committee on Public Relations formed

Holds ten regular meetings each year, one of which is joint meeting with the Cortland County Society held as a daytime dinner meeting at which some medical authority presents a paper Balance of the time spent in sports and social intercourse

The Chenango County Medical Society reported as follows

1 Postgraduate course on heart disease November 18—Etiology of Heart Disease and Bacterial Endocarditis

November 25 -Arrythmia Recognition and

Treatment

December 2—Valvular Lesions Myocarditis

December 9—Hypertension, including Blood Chemistry, Blood Pressure and Treatment,

also Angina and Coronary Occlusion
2 18 Pre-school consultations were held in
the county Pupils were examined by members of the Medical Society 76 toxin-antitoxin
clinics were held Local health officers did

this Eight TB clinics were held and five mental clinics

The county nurse is employed by the Board of Supervisors, who appointed a committee of nine to act as County Public Health Committee. This committee is composed of three of the supervisors, three from the County Medical Society and three laymen. Two of the doctors are members of the advisory committee directly in charge.

While the Medical Society as an organization has had no special representation in the child welfare work, several members of the Society have given of their time and talent, such as eye, ear, nose and throat and medical

treatment at greatly reduced rates

3 Papers read at meetings other than Postgraduate courses were Tuberculosis up-todate, by Dr Benedict, Cutaneous Syphilis, Illustrated by Lantern Slides, by Dr Schuyler P Richmond

4 Have taken in two new members

The following report was received from Tioga County

- 1 The Tioga County Medical Society had a postgraduate course in Pediatrics, in June and July, 1927 We have arranged for a postgraduate course in Internal Medicine for this spring
- 2 Our Society has three members on Public Health Committee and we direct the work almost entirely of the two nurses, one a public health nurse and one a maternity. We have endorsed Toxin-Antitoxin work but have done no active work as a Society. We held several child welfare clinics in conjunction with State Department of Health and members of the Society acted as examiners.
- 3 The Gwathmey Rectal Anesthesis in Labor, by Dr Stuart B Blakely of Binghamton Foreign Body in the Eye, by Dr Louis D Hyde of Owego

4 No

5 Active Legislation work

Broome County reported as follows

The Broome County Medical Society had a Postgraduate Course in Pediatrics in 1926 and a Postgraduate Course in Obstetrics in 1927

The County Society has taken some activity in promoting and using toxin anti-toxin in children of pre-school age. It has done nothing particularly in association with TB work or with Child Welfare

A great number of scientific papers have been presented at the regular county meetings by men invited in from other cities. Our meetings are held every month and the papers presented have covered much of the field of medicine and surgery with some of its special issues.

No increase in membership took place from the notices sent to non-members a membership committee and its function is to investigate and encourage non-members to join the Society Its function however, does not materially increase membership

The following report was received from

Otsego County

We have had two series of lectures, one on obstetrics and one on pediatrics We have arranged for a series to be given in May on

Internal Medicine

2 Dr Winsor has held monthly clinics on TB during the year. He is also on call or can be seen at the County Sanitarium any Toxin antitoxin use has been very general throughout the county, given at the hospitals and by the men in this county Nothing this past year on Child Health but this was gone over a year ago well There are several doctors on the Public Health work but would not say they were the controlling factor

3 May 4th Dr H L K. Shaw gave a paper

on Malnutrition of Infants

We had no meeting in June, as our custom has been, because the Postgraduate lectures ran over our date In December we had a paper by Dr K. Winfield Nev of New York on Traumatic Lesions of the Nervous System

In March, we had Dr Robert E Plunkett of Albany on T B and Dr Mars on Digestive

4 We have taken in only two new members, new comers in the county None of the older men have become interested because of the canvass

5 No work along this line

Cortland County reported as follows

1 Have completed the Course on Obstetrics and have arranged for a course in General Medicine

2 The Society has taken no active part in

Public Health work, but Clinics, TB work, Toxin-Antitoxin work, Child Welfare work, etc, are endorsed by the Society County Public Health Committee has been active in investigating the problem of a County Health Unit The Society has recommended to the Board of Supervisors of the County that a full time county health unit be installed

3 The following papers have been read March 18, 1927 "Aims and Purposes of Mental Clinics," by Dr Mary F Brew, Bing-"Retrocedeal Appendicitis," by Dr

J E Wattenberg, Cortland June 24, 1927 "Ancient Principles Applied to Modern Practice," Dr William D Johnson,

Batavia

September 9, 1927 Dr William L Wallace

spoke on the "Nurse Question" December 16, 1927 Dr Sadl Dr Sadlier, President of the State Society spoke on the Need of Medical Organizations Taking the Lead in Medical Problems and Dr Lawrence, Executive Officer of the State Society spoke on "Subjects for Study for the County Society"

4 No increase in membership has resulted from notices sent to non-members in Cortland

County

5 No other activities to report

The report from Chemung County was as follows

- 1 There was no postgraduate work in 1927 Two lectures completed of the present course 1928
- 2 We have no connection with Public Health work, etc, although our Society is represented thereon by one of our members who is Health Officer
- 3 December 13, 1928 Dr James Sullivan of Buffalo on "Surgery of The Gall Bladder"

5 Outing in June, 1927, at The Cold Brook Club

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Castle Hall, on April 18, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the Chair

Election of candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following candidates for membership Archie Cohn, Maurice Forman, James A Moore and Abraham M Skern

Dr Boas reported for the Committee on Public Health and Medical Education members of the Committee are at present engaged in an extensive study of the questions of Medical Service in the Public Schools and Baby Health Stations

The Scientific Program proceeded as follows

PAPERS

- 1 "The Injection Treatment of Hemorrhoids," Stephen J Spitzer
 - 2 'Peptic Ulcer, Samuel Weiskopf

The above Papers were discussed by Drs Henry Roth, Frankfeldt, Rosenzweig, Wechsler, Goldman Landsman (with lantern slides) Knapp and Appel

It was moved and carried that a vote of thanks be extended to the readers of the Papers and the gentlemen who discussed them

I J LANDSMAN, M D, Secretary

MEDICAL SOCIETY OF THE COUNTY OF QUEENS

A stated meeting of the Society was held at Eagle Palace, March 27th, 1928, at 8 30 P M, President Dr F G Riley, in the chair

Dr Chalmers gave notice of a presentation of plans for a new building for adoption at the next meeting, and moved that subscription blanks, as presented, be adopted by the society

The following were elected active members Harry D Berlin, MD, Rosedale, Kenneth Scott Bulger, MD, Kew Gardens, Paul Gebel, MD, Maspeth, Jerome F Granoff, MD, Hollis, Vincent Juster, MD, Jamaica

The following were elected Associate Members Leo G Goldberg, M D, Jamaica Hospital, Julius Tenke, M D, Jamaica Hospital, Martin Lester Weitz, M D, Jamaica

Dr E E Smith, secretary, announced to the membership a Seminar to be conducted at the Kings County Hospital under the auspices of the Joint Committee on Graduate Education of the Long Island College Hospital and the Medical Society of the County of Kings during the week of April 23-28, 1928

The following resolution was adopted

Whereas, the Borough of Queens has no city beds available for patients requiring free medical or surgical treatments, excepting those in the Queensborough Contagious Hospital, and

Whereas, this condition, especially in emer-

gencies, may be the cause of a serious morbidity and mortality, and

Whereas, it is the unanimous opinion of the Medical Society of the County of Queens that a sufficient amount of money should be appropriated by the Board of Estimate and Apportionment to erect, without delay, a City Hospital large enough to meet the needs of the people of the Borough of Queens, therefore be it

Resolved, that His Honor the Mayor of the City of New York and the Board of Estimate and Apportionment be and hereby are petitioned to erect a City Hospital in the Borough of Queens

SCIENTIFIC SESSION

Miss Teresa O'Neill addressed the Society in regard to the nursing service in the County of Queens

1 The address of the evening, "The Profession and Public Health," was given by Thomas P Farmer, M.D., Chairman of the Committee on Public Health and Medical Education of the Medical Society of the State of New York

2 Presentation of Motion Pictures, "The Doctor Decides" and "Delay Is Dangerous," by the Queensborough Tuberculosis and Health Association represented by Dr Charles S Prest

E E SMITH, MD, Secretary

THE DUTCHESS-PUTNAM MEDICAL SOCIETY

A regular meeting of the Dutchess-Putnam Medical Society was held at Vassar Brothers Hospital, Wednesday, April 18, 1928 The meeting was called to order by the President, Dr H St John Williams at 9 05 P M

The minutes of the previous meeting were read and approved

Dr E A Stoller of Poughkeepsie, N Y, was

clected to membership

Dr John A Card rendered a report of the public health and public relations committee and of the legislation committee. There was discussion by Drs Sadher and Harrington. The report was adopted

A bill was received from the public health and relations and legislative committee for expenses to the amount of \$7500 This was ordered paid

The President announced the following committees

Milk

Dr J E Vigeant, Chairman, Drs S E Appel,

Wm H Conger, C B Dugan, C A Crispell

Library

Dr A L Peckham, Chairman, Drs G L Lane, G J Jennings, J N Baldwin, C D Cadwell

Legislation

Dr John A Card, Chairman

Public Health and Public Relations

Dr John A Card, Chairman, Drs Scott I ord Smith, C Knight Deyo, W A Krieger, E Gordon MacKenzie

Scienlific Program

Dr Arthur J Bedell, N Y—"Lantern slide demonstration of photographs of orbital disease reviewed from the standpoint of general medicine"

Meeting adjourned at 11 00 PM for re-

freshments

There were forty members present
H P CARPENTER, Secretary

MEDICAL WARES

ARTIFICIAL LIMBS

The manufacture and fitting of artificial limbs is the oldest branch of orthopedics bronze artificial leg to supply the part missing after an amputation above the knee was found in a tomb at Capua dated 300 B C. The skeleton also had a bronze girdle, evidently as the sup-The ordinary contrivance used port to the leg to replace a missing foot was the common peg leg, such as was worn by Peter Stuyvesant, the last Dutch Governor of New York Pliny mentions that a soldier named Sergius living 167 BC had an iron artificial hand which he used on his enemies with terrific effect contrivance was used as a formidable weapon by an armored German knight, Goetz von Berlichingen, in the 16th century The simplest contrivance to take the place of the human hand consists of a hook attached to an arm collar. It is a curious fact that the hook is still one of the best contrivances to replace the missing hand of a common laborer The manufacture of artificial limbs in the United States may be considered to date from the year 1853 when A A Marks started the business in New York City, which is still conducted by the third generation of the family

The early makers of artificial limbs tried to imitate all the motions of a joint. The ankle joint, for example, was made movable, but great difficulty was encountered because the weight borne on it caused the bearing parts to wear out rapidly and to become unstable and squeaky. Rubber for the manufacture of feet was first used in 1863. Its flexibility and adaptability rendered an ankle joint unnecessary. The standard form of artificial foot today is made with a wood core covered with flexible rubber. The anterior quarter of the foot is somewhat flexible and the heel is springy, so that the absence of an ankle joint is noticeable to

a minimum degree
Many attempts have been made to imitate the natural hand and wrist so that the fingers may be made flexed and controlled by bands and levers, but experience has shown that the principal value of flexible fingers and wrist is that of esthetics Expert demonstrators of movable hands and controllable fingers will perform operations such as shaving and picking up pins, but a person with an ordinary amount of mechanical ability will find a rubber hand satisfactory Those who can afford the luxury of movable fingers can wear the hand for show purposes, while using the ordinary form of hand for work.

The framework of fingers of a modern artificial hand consists of flat wire made of Nor-

wegian iron which may be flexed back and forth for hours at a time without breaking, and yet will remain fairly rigid in any shape in which it is bent. This core of iron is covered with fabric and rubber which is vulcanized to form a firm imitation hand. The fingers of such a hand when partly flexed will support a weight of 100 pounds, which is amply sufficient to enable a man to carry burdens and grasp small objects.

The popular idea of an artificial limb is that it is made out of cork. This impression doubtless came from a popular song entitled "The Cork Leg," which was widely sung in the 40's and 50's. This song had eleven stanzas which recited the exploits of a cork leg which persisted in carrying its owner away against his will. The last stanza read

"He walk'd of days and nights a score,
Of Europe he had had the tour
He died—but though he was no more,
The leg walk'd on the same as before"

The material of which most artificial limbs are made is willow wood covered and strengthened with rawhide. The wood is shaped and hollowed out by hand according to measurements supplied by the physician Metal does not lend itself to artificial limb manufacture, because it is susceptible to corrosion by the perspiration, and its odor becomes unpleasant Another reasons for the use of wood is that it may be fitted to the limb A slight swelling or contraction of the stump will alter the bearing parts of the artificial limb so that pain is experienced when the limb is used, but often a slight amount of material scraped or sandpapered from the interior of the limb will ease the pressure and restore the part to comfort

The stump on which an artificial limb is worn must be protected with a woven covering. The standard material which is used for this purpose consists of webbing of wool or cotton which is worn to fit the particular limb.

Nearly everything which goes to make an artificial limb and its accessories is made by hand especially for that particular limb Slight differences in size and shape of the apparatus make all the difference between comfort and pain in wearing a limb. A person who wears an artificial limb must give it constant care and treat it as one would treat an automobile that is subjected to hard usage. It is attention to details which make for comfort. Even the sock which covers the limb must be made to order if the best satisfaction is to be attained.

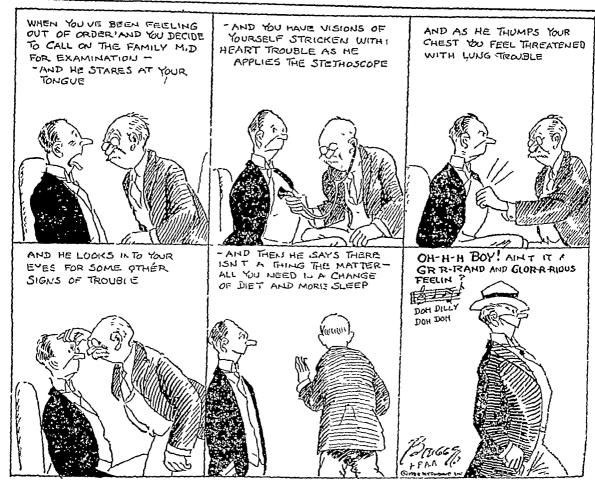

THE DAILY PRESS

Ain't It a Grand and Glorious Feelin'?

By BRIGGS

The Periodic Health Examination as seen by Briggs in the New York Herald-Tribune, April 5, 1928.

CHRONIC POISONING WITH RADIUM

The luminous paint on watchdials consists of small amounts of radium mixed with zinc sulphide. The New York Tribune of April 28, comments editorially on the poisoning of five New Jersey women who worked with the paint. The editorial says

"Habituated, it is alleged to touch their paint brushes to their lips in order to clean and point them, these workers seem slowly to have taken into their systems considerable quantities of the radium material used for the luminous figures on the dials. The result, physicians report, is a progressive destruction of the bones of the body, accompanied by an in-

jury to the red corpuscles of the blood and by other disastrous changes

"Radium seems not to be eliminated by the natural processes of the body but to accumulate in the bones, a circumstance not surprising when one remembers the close chemical similarity of radium to the common and harmless element, calcium, of which the bones are largely composed. Once fixed in the bony substance, the atoms of radium continue to discharge their superlatively powerful rays. It is these rays that work the damage. So long as the luminous radium materials are kept out of the mouth it is unlikely that they will do harm."

THYROIDS AND CHARACTER

Physicians are well aware that there is a physical basis for mentality, temperament and character. This subject has been investigated by Dr. Charles R. Stockard, Professor of Anatomy at Cornell University, who traces some of the characteristics of dogs to their endocrine glands. His investigations were the subject of news items in the New York daily papers, and of editorial comment in the New York Times of April 25, which says

"Some time in the past the excitable Boston terrier had a bad thyroid gland, and descendants are troubled by it. The British bulldog has achondroplasia, or lack of cartilage, and "is one of the most stupid of dogs." Also, it is handicapped by an undeveloped thyroid gland. The brisk and noisy Pekinese and Pomeranians had bad thyroids and pituitaries, the St. Bernard is a victim of acromegaly, or bony overgrowth, and diseased pituitaries, the Great Dane is a freak for size, and somewhere in his line of descent endocrine glands went on a

rampage

"None of these dogs but prevails over his wicked glands in one way or another. The great dogs of Mount St. Bernard devote themselves with intelligence and fidelity to the saving of travelers, the British bulldog belies its looks, and its docility and powers of observation are well known, the Boston terrier is a 'dear' to its owner, and as for the ladies' pets, their gland deficiencies are really their recommendation. If we are to make allowances for human beings on account of their endocrines, indulgence is in order for dogs in the neighborhood that annoy us by high spirits, barking, pugnacity and pursuit of the family cat"

This idea is stated in charming verse in the following poem by James J. Montague, printed in the New York Herald Tribune of May 8th

THYROIDS AND BOX FIGHTING

I used to think that bulldogs fought
Because with courage they were fraught.
I used to think
They did not shrink
Or wince in trials heroic
Because they had the heart and nerve
Which always thrills us to observe
In men of might
And brawn who fight
And take blows like a Stoic

But bulldogs fight. I've lately read. Because they're soggy in the head If they bear pain With grim disdain And bite with savage unction, If they keep fighting when they start Till some one comes and pries apart Their foaming jaws, It is because Their thyroids do not function Perhaps the game lads in the ring Who lead and jab and punch and swing And take rude blows Upon the nose And chin until they're groggy, Are not so gallant after all. Their thyroids may be rather small. And that explains Why bruisers' brains So frequently are foggy

CANNIBAL MOSOUITOES

The schemes for the extermination of mosquitoes are legion. A Texas physician has discovered a solution which will attract bats, that will live principally on mosquitoes. He has constructed open towers which he sprays with his secret solution. The bats come to the towers in great numbers and the guano which they produce yields a profit. The doctor offers to sell the Long Island rights to the use of the roosts for five thousand dollars.

The New York Times of May 2 carries a brief announcement "that a woman in Whitestone, Queens County, has written to Professor R. Legendre of the Academy of France, for a consignment of the invading troops, known as 'cannibal' mosquitoes She said yesterday she has been informed that experiments conducted by the French scholar show

that these cannibal mosquitoes will not attack human bings but that they will eat other mosquitoes. She will launch the mosquito war on her estate in Whitestone, and if the cannibals from Brittany are victorious, she said she would try to carry the campaign into other parts of Queens. She added that she had tried without success to interest New York City Health Department officials in the scheme."

The plan may not be so impractical as it might seem, but like the bat roost scheme, the enemies will die of starvation when the mosquitoes on which they feed are reduced in number. Killie minnows in the ditches of salt marshes are the most efficient of the living enemies of mosquitoes. They are almost as necessary as the free drainage of salt marshes.

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their ments, or in the interests of our readers.

- METHODS AND PROBLEMS OF MEDICAL EDUCATION (Eighth Series) Quarto of 375 pages, illustrated. New York, N Y, The Rockefeller Foundation, Division of Medical Education, 1927
- THE THYROID GLAND AND ITS DISEASES By NORBERT ODEON BOURQUE, M.D. Octavo of 250 pages (Chicago, The Author, 1927)
- RECENT ADVANCES IN OPHTHAI MOLOGY By W STEWART DCKE-Elder, MA, DSc Octavo of 343 pages, illustrated Philadelphia, P Blakiston's Son and Company, 1927 Cloth, \$3 50
- Annals of the Pickett-Thomson Research Laboratory (Containing a Historical Survey of Researches on the Streptococci) Volume III Quarto of 316 pages Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$10.00
- Bedside Diagnosis By American Authors Edited by George Blumer, M.D. Three octavo volumes, totalling 2820 pages, containing 890 illustrations. Philadelphia and London, W. B. Saunders Company, 1928. Cloth, \$30.00 a set. Separate desk index volume free.

BOOK REVIEWS

STANDARD METHODS OF THE DIVISION OF LABORATORIES AND RESEARCH OF THE NEW YORK STATE DEPARTMENT OF HEALTH AUGUSTUS B WADSWORTH, M.D., Director Octavo of 704 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$7.50

This splendid work on laboratory procedure and organization deserves the highest praise. It should prove a standard guide for all who are engaged in laboratory

administration,

There is a brief description of the laboratory buildings at Albany There follow chapters on general laboratory procedures including stains, media, preparation of glassware, use of animals, diagnostic tests in bacteriology and serology and examination for rabics and other special and unusual diseases encountered in public health work. Then come methods used in sanitary and analytical work, methods of anti-toxin, serum and vaccine preparation. A valuable feature is the detailed direc tions given for all methods. Concluding chapters deal with methods in the executive offices such as records, reporting, filing, distribution of diagnostic outfits, pur-chase of supplies and clerical work and methods used in research, publications and library departments. This work consists of nearly 700 pages replete with

details The reviewer can only point out the salient features and heartily recommend it to all laboratory directors and workers

E. B. SMITH

KER'S MANUAL OF FEVERS Revised by CLAUDE RUNDLE, OBE, M.D. 3rd Edition 12mo of 346 pages, illustrated. London and New York, Oxford University Press, 1927 Cloth, \$3.75 (Oxford Medical Publica-

This volume is a revised Edition of the well known Manual by the late Doctor Claude Buchanan Ker

The original book has been a standard work of its kind for students and general practitioners, especially in England The present revised edition brings the subject matter up-to-date by incorporating the results of recent research particularly as regards bacteriology, immunology and serum therapy. The book is a brief practical description of the acute infectious diseases, and includes besides the acute exanthemata, chapters on typhus, enteric fever, diphtheria, erysipelas, whooping cough, mumps, vaccinia and cerebro spinal meningitis. The style is brief and simple, the type large and legible and the binding fairly well and attractively done.

Joseph C. Regan UROGRAPHY By WILLIAM F BRAASCH, BS, MD 2nd Edition, revised Octavo of 480 pages, illustrated Philadelphia and London, W B Saunders Company, 1927 Cloth, \$1300

This replete and complete treatise of the subject contains nearly five hundred pages. By far the greater portion of these is devoted to uretero-pyelography, with a most extensive collection of films

In opening, a rather full lustory of the development of the art is given, followed by a bibliography of 137 refer-

ences

The text is clear and concise, and the illustrations which appear on almost every page, absorb the reader's interest. These should add considerably to the knowledge of every urologist, cystoscopist and radiologist, and train the eye to become more expert in the recognition of the many and varied disease changes encountered in this

Braasch's valuable collection and text are an out-

standing contribution to Surgical Urology

It is worthy of note that no mention is made of the subject of pyelovenous backflow Augustus Harris

A TEXT-BOOK OF HISTOLOGY Arranged Upon an Embryological Basis By Dr Frederic T Lewis and Dr J L. Bremer This is a revision of the second edition of Lewis and Stolie's Textbook of Histology, based on the fifteenth German edition of Stohr's Histology Octavo of 551 pages, with 485 illustrations Philadelphia, P Blakiston's Son & Company, 1927 Cloth, \$600

This volume is a revision of the second edition of Lewis and Stohr's Text-Book of Histology. In addition to dealing with the adult tissues and organs, the authors place before the student the embryological approach to the histological study of each organ

Very sensibly Bremer has left out the study of the brain and the cranial nerves, these requiring so exte sive a survey as to be best handled in a separate consideration of neural anatomy

A noteworthy feature is the incentive to supplementary reading by the references to modern and easily accessible publications, showing as it does the growth of American contributions to the subject.

The book is a satisfactorily substantial and comprehensive one and we are indebted to the author for his excellent embryological descriptions of the individual organs and tissues JESSE M FRANKEL

COMPEDIUM OF REGIONAL DIAGNOSIS IN AFFECTIONS OF THE BRAIN AND SPINAL CORD A concise introduction to the principles of clinical localization in diseases and Injuries of the central nervous system By Robert Bing Translated from the sixth German edition by F S Arnold, B.A., M D 3rd Edition, revised Octavo of 204 pages with 102 illustrations, St. Louis C. V Mosby Company, 1927 Cloth, \$6.00

This volume needs no introduction, for it has been known since its first publication (in English) in 1911 as an indispensable guide to the topography of the central nervous system. Few textual changes have been made in the sixth German edition of which the present volume is a translation, but there has been a considerable revision of the illustrations and some of the diagrams have been replaced by others better and more graphic. The volume contains a prefatory note by Dr Sidney HENRY A. BUNKER, JR.

THE TOAGUE AND ITS DISEASES By DUNCAN C L. FITZWILLIAMS, CMG, MD Octavo of 505 pages, sillustrated. London and New York, Oxford University Press, 1927 Cloth, \$11 00 (Oxford Medical Publications)

From time immemorial, in medical practice, the tongue has been a guide to the practitioner Even today, in conditions that are medical or surgical, it gives us important information. How fitting and proper it is therefore to have supplied to us an exhaustive treatise on the tongue.

The material that furnishes the bulk of the text is taken from the records and specimens of St. Mary's Hospital in London Of necessity, other sources have

been used for part of the material

The work includes a detailed and comprehensive consideration of errors of development, functional disturbances, injuries, infections and tumors of the tongue. In connection with the latter large space is devoted to diagnosis, treatment and prognosis. As a fitting climax one chapter is devoted to comparative pathology

The book contains 166 illustrations in its valuable

500 pages One may state, with enthusiasm, that the book is replete with instruction and interest and should be a useful text for either physician or surgeon.

ROBERT F BARBER

Anatomical, Phylogenetical and Clinical Studies on the Central Nervous System By B Brouwer Octavo of 67 pages, illustrated Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$2 50

This book a collection of the Herter Lectures of 1926, given at the Johns Hopkins Medical School, by an internationally acknowledged leader in the field of neurology To those who have had the opportunity of listening to Prof Brouwer during his stay in America, the book will have an additional interest. The first lecture deals with the projection of the retina in the brain. The second with the pathology of sensibility The last, deals with the significance of Phylogenetic studies for the neurologist. The author has based his lectures on a very extensive period of research in the fields of comparative neurology, physiology, and pathology, and balanced by a rich experience in clinical neurology book is one which the average physician would not dispense with, and one which the average neurologist would greatly value Furthermore, it is a book that should serve as a stimulus to the young medical graduate and to the medical profession in general

Practical Bacteriology, Blood Work and Animal Parastrology Including Bacteriological Keys, Zoological Tables and Explanatory Clinical Notes A Compendium for Internists By E R. Stitt, A B, Ph G, M D 8th Edition revised 12mo of 837 pages, illustrated Philadelphia, P Blakiston's Son & Company, 1927 Cloth, \$600

This book has long been a favorite with the reviewer because of its practicality. It now appears in its eighth edition, revised and somewhat enlarged. The increase in size is due to the addition of new matter and methods in clinical pathology which bring this edition as completely up to date as is possible in a text-book. One notes the use of the new bacteriological nomenclature as given in Bergey's Manual, along with the old familiar names. Among the newer tests one finds the Kahn and sedimentation tests. Other new matter includes discussion of dental infections hemorrhagic diseases, sicklecell anemia and liver function tests.

E B SMITH

Insurability Prognosis and Selection Life—Health—Accident. A Treatise on Various Factors that Permit a Forecast of Health and Longevity Selection of Risk for Insurance Appraisal of Claim for Indemnity By H W Dingman, M D Chicago and New York, The Spectator Company, 1927 706 pages, 8vo Cloth, \$1500

This volume is most complete in its contents of the treatment of Life Insurance Medicine with particular reference to the selection of applicants

Part I gives a very complete history of Life Insurance and Selection Methods with a chapter devoted to the numerical selection which is being used so extensively at the present time.

Part II devoted to Personality, taking up the relationship of the applicant, agent, medical examiner, medical referee, and inspector, is something new and vervextensive and conclusive, as well as instructive.

Part III devoted to the Limits of Insurability is most exhaustive and gives in detail the most up-to-date methods used in the selection of risks

Part IV taking up Impairments in general is very interesting and gives in very concise form a study of recognition of the commoner and also more infrequent disease conditions to which apparently healthy individuals may be subject.

The book is a reference book with complete Mortality Tables, Build (Height and Weight) Tables, also giving in detail present methods of the selection of Life Insurance risks, and should be of tremendous value to any Life Insurance Medical Library

G HOLEROOK BARBER.

MEDICO-LEGAL INJURIES BY ARCHIBALD McKENDRICK, F.R.C.S.Ed. Octavo of 341 pages, illustrated London Edward Arnold & Company, (N. Y., Longmans, Green & Company), 1927 Cloth, \$700

When workmen's compensation laws were first enacted several rather radical things occurred. State medicine, for one thing, began That is, practice under state regulation was instituted. Another event, which logically and naturally followed the preceding one, was that practice in the compensation field was conducted under the direction of laymen. Referees and representatives of claim departments of insurance companies are generally laymen and, unless by long experience they have acquired it, lack knowledge of terminology and the fundamental sciences which have to do with injuries

Dr McKendrick's brochure is written frankly as a result of that lack of knowledge, which had created a demand for a treatise in non-technical language to which interested laymen might turn for light. Within these limitations the book is well done and will be distinctly helpful to those concerned in the administration of this sociological statute who, not being physicians, lack understanding of, and familiarity with, traumatic problems

There is much meat in the work which is of interest to the doctor, especially those chapters devoted to the physics of injury, back injuries and relationship of disease and injury Dr McKendrick is a good doctor with a clear understanding of skeletal mechanics and a fine facility for translating technical language into comprehensible terms. He obeys the admonition of John Ruskin—"Think clearly, describe simply" F D J

X-RAYS AND RADIUM IN THE TREATMENT OF DISEASES OF THE SKIN By GEORGE M MACKEE, M D Second Edition, revised Octavo of 788 pages, illustrated. Philadelphia, Lea and Febiger, 1927 Cloth, \$1000

Enough cannot be said in commendation of this excellent book. The author, who is extremely well versed in the subject has handled it in a most able manner

The historical chapters on Roentgen Rays and the Radio Active elements are quite interesting, and are of great value to one studying the uses of these agents. Then follows the groundwork of physics, chapters on Radium technic, X-ray apparatus, tubes, instruments for measurement of X-ray dosage, computation of dosage, X-ray technic, and so on, including all things required in equipment and knowledge by and of an X-ray therapeutist doing superficial work.

Having concluded the physical, or mechanical, side of the work the author, in considerable detail, considers the clinical effects of the rays on the skin, the pathological histology of radiodermatitis, and, finally, the diseases which may be, and which should be, treated by means of the X-ray. These diseases he has grouped according to the results that may be expected. In another table of about eighty cutaneous diseases, he has keyed each disease with a symbol showing the general usage of X-ray in their treatment. Other chapters are devoted to these diseases as individual entities, wherein the treatment is definitely outlined simply enough for the beginner to understand, and here the author also points out numerous pitfalls and contraindications.

As if all this were not enough, there is included an excellent chapter on the medico-legal aspect of Roentgen therapy and Radium therapy. This chapter should be as carefully read as any other in the book—it will prove of interest, and, mayhap, of great value.

It has been a distinct pleasure to review this book for it is so well written, and so beautifully constructed by the publishers E Almore Gauvain ACTINOTHERAPI For General Practitioners B3 H G
FALKNER, L.R C.S I Octavo of 152 pages New
York, William Wood and Company, 1927 Cloth,
\$3.00

This work is an interesting addition to the literature of what is now a rather extensive subject. The personal experience of the author is reflected throughout the book, but that of others does not come in for its share of consideration. The description of the artificial sources of ultraviolet light is interesting and accurate, but is far from complete. A timely note of warning is sounded against the indiscriminate use of the powerful ultraviolet emitters, particularly the present fashion of lay installation and use.

Jerome Weiss

STUDIES IN PSYCHOLOGY Memory, Emotion, Consciousness, Sleep, Dreams, and Allied Mental Phenomena By WILLIAM ELDER, M D Octavo-of 212 pages London, William Heinemann, Ltd, 1927 Cloth, 8 shillings, 6 pence.

New books appear on psychology every few days now The author need accept no standards. He can make a premise, and then have a delightful time by explaining anothing on the premise. It is quite unnecessary to make sure of a correct premise in the minds of nimble mixers of words. It is a relief to find a book in which the author does not try to be erudite, or rush into polysyllabic speech, and who treats the unknown as the unknown. He knows that it is obvious that no one talking about the conscious or the unconscious has anything quite specific in mind. Mythical explanations are quite unsatisfactory to him. What cannot be explained he does not explain. We would like to practice medicine in his neighborhood.

The chapter on the emotions is information. How simple it is to remember that there are only two types of emotions, the pleasurable and the unpleasurable. The physician is only consulted about the latter type. In his discussion of dream analysis the author carefully and capably dispenses with much of the Freudian intellectual sewage.

The information in this book flows easily from the page to the brain of the reader. There is no interference. It is destined to enjoy a degree of popularity not usual with many of the recent books on the same subject.

J ARTHUR BUCHANAN

AIDS TO BIOCHEMISTRY By E. ASHLEY COOPER, D Sc., and S D NICHOLAS, B.A. 16mo of 188 pages New York, William Wood and Company, 1927 Cloth, \$1.50

This small volume contains, in concentrated form, the more important facts and methods of biochemistry. As the authors explain in their preface, this volume is not intended as a text book, rather, it is for students who have already studied the subject who desire to review and bring their knowledge up to date. Directions for the usual tests and laboratory experiments are given

A. H EGGERTH

SPECIAL DENTAL PATHOLOGY A Treatise for Students and for Practitioners of Dentistry and Medicine. By Julio Endelman, M.S., D.D.S. 2nd Edition Octavo of 444 pages, with 371 illustrations St. Louis, The C. V. Mosby Company, 1927 Cloth \$700

This compact textbook of dental pathology is a second edition, much improved, and to which has been added many clear-cut illustrations of not only microscopic pathology but also gross pathological anatomy as seen in the living patient.

To understand the scope of this book, one must remember that the word dental' or 'oral disease" includes all structural or physiologic deviation from the normal in the hard tissues of the teeth, in the pulp, peridental membrane, alveolar process, gingivae, guins, in the soft tissue lining the mouth and in the salivary glands. This is especially to be borne in mind in order to appreciate the effect of focal (dental) infections upon general systemic conditions. For the modus operandi of the pathological phenomena involved in the transportation of bacteria and their toxins from the teeth to remote areas of the body with the resulting reaction, is fully discussed

There is no doubt that this book will continue to hold a high place in dental literature and also be regarded as a good reference book for dentists and physicians interested in special dental pathology

OSCAR RODIN

LECTURES ON THE BIOLOGIC ASPECTS OF COLLOID AND PHYSIOLOGIC CHEMISTRY A Series of Lectures Given at the Mayo Foundation and the Universities of Minnesota, Iowa, Washington (St. Louis), and the Des Moines Academy of Medicine, Iowa—1925-1926 12mo of 244 pages, illustrated. Philadelphia and London, W B Saunders Company, 1927 Cloth, \$250

This series of lectures covers the more recent and important studies in colloid chemistry as applied to the fundamental problems of biology. Each lecture is given by one who has done original work in that particular field and hence every chapter in a resume of the investigator's own results plus his interpretation of the studies of others in similar fields

It is an admirable book for the medical man interested in the basic vital phenomena.

A G

AMERICAN MEDICINE AND THE PEOPLE'S HEALTH AN Outline with Statistical Data on the Organization of Medicine in the United States By Harry H Moore. Octavo of 647 pages illustrated. New York and London, D Appleton and Company, 1927 Cloth, \$500

Mr Moore, Public Health Economist, (whatever that may allege), has inked 650 pages to miss both sides of his subject. Neither medicine nor human conduct are perfect. Around the foibles of each he weaves his theme. One misses the balanced logic, the candor and the honesty of a scholarly and trained investigator and analyst. He finds a jazz-band syncopation of topics and words thru which runs the beat-note of cheap medicine for that "75%" of our people who are neither pupers nor princes of wealth.

The author avows an open mind and then in his test reveals a mind committed to organized state medicine to machined merchandised sick-service. Here subtle and there frank, by invendo and strategem, he argues for an industrialized profession, for the socialization of curative as well as preventive medicine. Boldly he asserts "Compulsory Health Insurance is not a dead issue." "Adequate health insurance for all the people, independent of medical service." How adequate for what? Is this the first step of a two-stage operation to communize sickness and to burglarize the medical profession?

We must thank the author for an excellent forecast of future medicine, if the uplift non-medical neo-bolshevists are to be permitted to shape the laws and social changes of the next decade. Some of our brothers who are too proud to fight, too proud to think of economics, should read this book and cognitate.

F E. ELLIOTT

OUR NEIGHBORS

THE ANATOMY OF GROWTH

Physicians are likely to be hazy in their ideas of what constitutes normal growth. The leading article in the April issue of Northwest Medicine, by T. Wingate Todd, F.R.C.S., Professor of Anatomy in Western Reserve University, deals with this subject in an interesting way, as is shown by the following extracts—Editor's note

The pigmies of the Congo forests have grown to be men but in dimensions they are not more than ten year old boys. They are not misshapen or men with the proportions of boys. The normal increase in dimensions, characteristic of the majority of mankind, has failed, but the features have continued to modify so that the adult proportions are attained. This, then, is our first lesson in dissociation of growth

While increase in dimensions is lacking after adult age is attained, the change in proportions continues throughout life, the individual has grown old we would say. By change of the proportion we can estimate age just as well as by the increase in dimension. This is the central theme of my presentation. It is a qualitative change and yet is as definite, though more difficult of measurement, as the quantitative dimensional change. Now let us clinch this argument by certain cases of dissociation of growth

Here is the skull of a lad of eighteen years, Ludwig by name, arranged with the skull of a normal lad of eighteen on one side and that of a child one year old on the other Ludwig has grown so that his skull cap will fit easily like a hat over the other eighteen-year-old's head Dimensionally he has nothing lacking But note the disproportionately small face, the undeveloped jaws, the rounded forehead, the small cheek bones These are matched by the one-year-old In other words, Ludwig has not matured, his proportions have not kept pace When we look at his with his dimensions side face we see even more clearly the baby jaws, the undeveloped zygoma and mastoid and the lack of muscular ridges on the skull Something has occurred to inhibit the differentiation of maturation of Ludwig's skull, while permitting to the full his increase in dimensions This is the exact antithesis of the pigmies mentioned above

Dimensions are a matter of heredity on the one hand and nurture on the other Little Rose brings a message from her mother asking if I

will tell her what she can take to make her grow big I can give no hope of this for Rose's mother and father are both made on small lines and Rose will always be small and slenderly built. She will always be under weight for her age but may nevertheless be strong. Height and weight tables are apt to be disappointing and we are compelled to search for some standard of growth which is independent both of heredity and nurture. Hence we are driven from the quantitative dimensional measurement to the qualitative proportional determination.

Scammon has shown that, when we consider relative postnatal growth, we must group skeleton, lungs and blood with the body as a whole Of these organs the skeleton lends itself most readily for our determinations For the period of life which we have been studying, namely that of the grade school child, roughly between five and twelve years, Stratz has demonstrated that there is, on the average, a fairly even percentage increment of growth in height, distinctive from the spurts below and above this period If, then, we confine our attention in the preliminary stage to this period of life, we are not likely to be confused by the entry into our observations of factors called forth by special activity

Previous work upon the skeleton gave us courage to engage in an expensive and time-consuming investigation. We had been at work for some years upon closure of sutures and union of epiphyses. Contrary to current assumption, we have discovered a close time-relation in both these phenomena. But whereas individual differences in epiphyseal union are slight, those of suture union are so considerable that it can only be used as an average for the

During the past two years, supported by the Cleveland Health Council and the Board of Education, we have made repeated observations upon the roentgenographic features of the limb epiphyses of between 600 and 700 children. It will be some years before the immense mass of data thus called into being is fully developed.

But we are already in a position to report substantial progress and can assure ourselves of a positive result. Of all the limb epiphyses those of the knee are easiest to study for they are covered by a negligible amount of soft

Maltine WITH COD LIVER OIL

FOR years, physicians have regarded cod liver oil as a valuable antirachitic

Maltine With Cod Liver Oil is thirty per cent pure medicinal cod liver oil, and seventy per cent of it is an extract made up of nourishing elements of barley, wheat and oats. It is readily digested, and has the food value of its maltose dextrin and dextrose content.

As an adjunct to the dietary of infants and children—as a concentrated, easily assimilated food, Maltine With Cod Liver Oil is preferred by many physicians to cod liver oil alone. It is more palatable than plain cod liver oil. For adults as well as for children, Maltine With Cod Liver Oil is a dietary adjunct that may be safely prescribed and recommended to advantage.

(Continued on page 621, adv xv)

(Continued from page 618)

tissues and the roentgenographic shadows are correspondingly slightly detormed It must be noted that we lay no stress upon ossification of carpals or tarsals, a phenomenon which we do not find to be closely time-linked as is the differentiation of bony epiphyseal outline

While we are examining the children with the x-ray, we are also measuring them, weighing them and determining their muscular We find that our growth curves strength closely parallel those of other workers and we have plotted ours against those of Baldwin's Horace Mann School series

If we apply the information thus received to the undernourished child, we find that it is quite possible to analyze the condition of the child in age, height, weight, roentgenographic development and muscular power By these means it can be demonstrated that there are quite different types of undernourishment, that one type affects weight, another muscular strength, that frequently the so-called undernourished child is really a human weed, whose height has mounted disproportionately to his other features I would close by presenting, as a general object, the thesis that in attacking undernourishment we should first analyze the condition of the child and then concentrate our effort upon that phase only in which the child is deficient, not attempting in the weed type to bring weight up to height, but resting satisfied, if the weight is raised to the local average for age and roentgenographic development

AMERICAN MEDICAL EDITORS' ASSOCIATION

The Atlantic Medical Journal for April contains the following editorial on the American Medical Editors' Association

"The editor of the Atlantic Medical Journal has recently become a member of the American Medical Editors' Association, and it is hoped that this affiliation of our publication with others in the same field of work will be of assistance in broadening the scope of our service-both to our readers and to medical Journalism in general through participation in the activities of those charged with responsibility for so important a branch of postgraduate education

"With the death of the late president, Dr Henry O Marcy, the Association became inactive for five years. At the time of Dr Marcy's death 117 editors were on the ros-Early in January, 1928, the present president, Dr H Lyons Hunt, called a meeting of a few New York editors to discuss the advisability of reviving the Association vote of those present was unanimously in

Ultra-Violet Combined With Heat and Light Make Possible a Wide Range of Therapeutic Uses

CLINICAL evidence and the experience of well-known authorities has shown that the new Battle Creek Super Solar Arc Lamp may be successfully used to treat a wide range of the most stubborn and deep-seated disorders

Not only does this AD-VANCED-TYPE LAMP possess many improved mechanical features of construction, such as the automatic magnetic feed which prevents loss of time in waiting for the rays to attain adequate intensity, but the superiority of this lamp in the treatment of general constitutional conditions, as well as local surface conditions, is largely due to the combination of rays produced

An ample amount of ultraviolet radiation infra-red, results in the production of a spectrum that most closely approaches that of the sun Since the Super Solar Arc combines ultra-violet and infra-red rays it finds dozens of uses, for rachitic patients, for skin diseases, for relief of congestion, and other conditions The technic of handling this lamp is easily and quickly mastered

Our new bulletin describes fully the many mechanical and therapeutic advantages of the Super Solar Arc May we send you a copy?

First, in answer, I would place their inherent potential value to the medical profession and to the community If the claims made for the wives of physicians may be duplicated in fair measure for mothers, sisters and daughters of physicians, you have in the state of New Jersey a conservative average of two intelligent women interested in the work of each of 2,400 physicians—quite a little reservoir of untapped energy, and hitherto an unlisted asset in public health holdings women have acquired a certain professional consciousness which has rendered them alert to help create and maintain the standards of preventive and curative medicine which as individuals they would despair of even attempting. To be concrete (and necessarily personal) I have spoken to date to audiences approximating a total of 2,700 persons on subjects of periodic health examination and diphtheria immunization. I am employed by the state medical society to do this educational work but I have met more than ore member of that society who did not know of my existence and I have received through the members of that society less than 5 per cent of the opportunities which have been afforded me to present this message of theirs That means that 2,000 physicians are so engrossed with actual patients that they pay little attention to the attitude of the well members of the community toward them or their profession Perhaps it is true that the busy physician has little opportunity for contact with the well members of society, but his women folk do have many points of close contact. And yet how many women are going to interest themselves in furthering the program of an organization to which they do not belong or to which they have not some form of attachment? In many instances auxiliary members are also on the local school boards, but apparently they have never before connected the eager, receptive audiences of the school assembly, and the intelligent units of the Parent Teacher Associations with the furtherance of that science to which their husbands are giving their lives And this seems the moment to ask what physician, who has the physical welfare of humanity at heart could say that he does not desire such cooperation, or that the woman he has chosen to be his wife should not or could not logically furnish it?

The second answer to the question, why an auxiliary lies in the possible value of such an organization to the members themselves. I mean by this the acquiring of such elementary and correct general knowledge of medical subjects as they have not the time to gather individually and which their husbands certainly have not time to impart. I have been repeatedly impressed by the fact that every woman who runs a doctor's house seems to feel snowed under by the telephone, and in many cases her sum total of pro-

favor That need was felt for the organization can best be demonstrated by the fact that not only practically all members of the old Association came in, but over a hundred new members made application, so that today the Association is stronger than it has ever been As the organization swung into power, numerous meetings were held, officers elected, and committees appointed to study and promulgate a tentative platform. The activity of the Association is shown by the fact that committees have been appointed to study the following subjects.

"Medical Journal Endowment Fund,

"Standardization of Medical Education, "Standardization of Medical Licensing Examination.

"Bringing about of International Medical Reciprocity (four committees, one each in Canada, United States, England and France have already been appointed to study this subject).

"Workmen's Compensation,

"Pay Clinics,

"Commercial Laboratories,

"Open Hospitals,

"Medical Compensation, "Drug Store Prescribing,

"Pharmacy and Therapeutic Products,

"Electrotherapeutic Apparatus,

"Prohibition,

"Legislation,

"Advertising,

"Publicity,

"Policy,

"Public Health,

"Medical Economics"

The list of subjects to be studied does not contain a single subject connected with Journalism

WHY A WOMAN'S AUXILIARY

The Medical Society of New Jersey has an active Woman's Auxiliary which functions largely through the paid educational secretary of the Society, Mrs Taneyhill The April Journal of the Society contains a letter from Mrs Taneyhill from which the following extracts are taken—Editor's note

As your associate in the educational work of the Medical Society of New Jersey, I have had the privilege, during the last few months, of meeting with 13 of the Women's Auxiliaries. In retrospect, these pleasurable occasions have crystallized into several definite impressions that may be of interest to you as bearing on that vexed question, Why an auxiliary?

And then came the redemption of the liver from its lowly estate. With astounding abruptness it became chief over all meats in price A food expert discovered that a diet of calf liver made robust beefy looking people out of pale anemic persons. It made for fat and muscle in short order and the weak became strong over night. The glad news spread abroad through the mighty press, and the demand for liver, hitherto a drug on the market, became active If one, unacquainted with this meteoric rise of the humble liver should, as of yore, enter a butcher shop and ask for a dime's worth of calf liver, he would get about one bite. By jumps, up went calf liver from seven cents a pound to 15, then 20, 30, 40, 50, 60 and 70 cents a pound—away higher than choice beef, lamb or veal in war times

And just as in the grain market reports, we find corn and oats, following wheat upward in stiff markets, so cow's liver partook somewhat of the prosperity of its infant's liver and the market quotation mounted to 30 cents

But as one star differeth from another star in glory, according to the scripture, so different livers have different grades of glory and price The liver of the pig has not kept pace with the rise of calf liver. It remains around seven But there are advantages in this fact, the advantage being with the man of the house if he does the marketing, a lady tells hubby she wants some calf liver as she feels The man, always sceptic, is unable to differentiate the respective glories of liver and takes little stock in the wife's complaint of being anemia's victim. He buys a pound of sliced pig liver for seven cents and pockets the remaining 63 cents The wife eats of the pig liver, convinced that she is eating of the calf and she no longer has symptoms of

The husband, for obvious reasons, encourages his wife to keep her calf liver diet at least three times a week. He now smokes better cigars and more of them

AUTOMOBILE DRIVERS

The problem of the defective automobile driver is being widely discussed in the light of the ever increasing number of injuries and fatalities caused by automobiles. There is a growing tendency to consider that so-called accidents are not merely happenings, but are the inevitable result of conditions which could readily be foreseen and controlled. The following editorial from the April issue of Northwest Medicine deals with this question of the defective driver—Editor's note

fessional knowledge is where he is to be found at the particular moment of the call or when he will be in his office That the wife of a physician occupies a place of relative importance in every community will be generally conceded. I believe. That she may be a potent factor in molding public sentiment concerning medical matters would seem to be a natural corollary to that fact, and it would follow that her cooperative value would be in proportion to her information regarding the issues at stake Surely every wife, mother, daughter or sister of a physician is capa ble of assimilating the facts pertaining to the need for legislation respecting the inoculation of dogs against rabies, surely such women should be able to give the cold unanswerable facts about vaccination, diphtheria immunization, typhoid in oculation and kindred subjects, when some highly misinformed sister delivers herself of unctuous error at the card club or tea party vincing, however, one must be accurate, and accuracy is not acquired haphazard. Is there, then, anyone who would deny that the auxiliary can accomplish much as a study club?

THE LIVER FAD

The Journal of the Arkansas Medical Society makes up with quality what it lacks in size Its editorial writers invest a prosaic scientific subject with a gentle humor which is a characteristic of the ideal family doctor. The following editorial is an excellent example of human quality of doctors from editors to family physicians—Editor's note

Yes, Mr Printer and proofreader, the above caption is correct, so please do not make it "The Liver Pad," under the impression that the writer made an error in spelling or hit the wrong key of his typewriter. This story concerns the rise of the liver of commerce. It affords an example of how the humble may eventually find a place in the stomach, if not in the sun. The liver pad has made manufacturers rich, the liver fad promises to do the same for the butcher.

For many years, in fact as long as memory of this generation endures, the liver, as an edible has been regarded as a plebeian dish. On the restaurant menu liver and onions, or liver and bacon, has been the cheapest of viands offered to the hungry. It has been the dish of the third rate boarding house, despised by the proud and haughty, even as in the same class as the equally plebeian corn beef and cabbage. The butcher was wont, on request, to throw in a bit of liver for the cat with the purchase of a steak or chop. The poor in purse could for a dime get enough liver to feed a family

ODE TO A SKELETON

The following poem is from an address by Dr A D McKinley of Des Moines, reported in the April Journal of the Iowa State Medical Society. It is reported here because those of our readers who recognize the first three verses will be interested to know that there are two more written in the same style—Editor's note.

Behold this ruin, 'tis a skull Once of ethereal spirit full This narrow cell was hie's retreat, This space was thought's mysterious seat What beautiful visions filled this spot? What dreams of pleasure, long forgot? Nor hope, nor joy, nor love, nor fear Hath left one trace of record here

Beneath this mouldering canopy,
Once shone the bright and busy eye,
But start not at the dismal void,
If social love that eye employed
If not through evil fires it gleamed,
But through the dews of kindness beamed,
That eye shall shine forever bright
When stars and sun are sunk in night

Within this hollow cavern hing
The ready swift and tuneful tongue,
If falsehood's honey it disdained,
And when it could not praise was chained,
If loud in virtue's cause it spoke,
Yet gentle concord never broke,
That silent tongue shall plead for thee
When time unfolds eternity

Say, did these fingers delve in the mine, Or with the envied ruby shine? To hew the rock, to wear the gem, Avails but little now to them But, if the page of truth they sought, Or comfort to some mourner brought, These hands a greater meed shall claim Than all that wait on wealth and fame

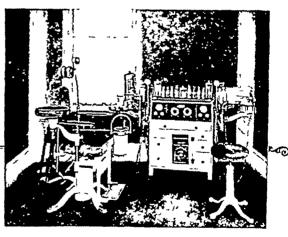

Avails it whether bare or shod These feet the paths of duty trod? If from the bowers of ease they fled, To seek affliction's humble shed, If grandeur's guilty bride they spurned And home to virtue's cot returned, These feet, with angel's wings shall vie, And tread the palace of the sky

QUBENSBORO PLAZA 15 MINUTES FROM TIMES SQUARE

(Continued from page 625, adv xix)

The mortality from automobile accidents in this country has reached such an appalling figure that there is a constant and wide-spread demand for some sort of action to be taken that will check its continuance Many suggestions have been offered and laws have been enacted to protect the public from the death-dealing automobile As yet, however, marked results do not seem to have followed these efforts While there are doubtless many collisions and fatalities, for which the drivers of automobiles are in no manner at fault, yet responsibility for the great majority can be placed on the man at the wheel In a large proportion of cases irresponsibility of youth or the ingestion of alcohol is discovered as the primary fault Recently two youths drove wildly about city streets, finally dashing into a group of high school students awaiting a street car Two of the latter were killed and others seriously The perpetrators of this outrage claimed they were under the influence of liquor and partially stupefied from the effects of barbital

Little attention has been directed toward deficient eyesight as a cause for automobile accidents. Who knows how many drivers on our streets are color-blind, unable to distinguish the red from the green signal lights. In-

stances have been known of active railroad engineers and street car motormen with color blindness which in some manner had escaped observation One is appalled at the contempla tion of possible tragedies at the hands of such individuals The likelihood of similar catastrophies from automobile drivers with this defect is more than an idle dream. In every city men are driving automobiles whose vision is so defective that they barely escape the classification as blind men There is no way of detecting the individuals herein discussed, unless they be subjected to physical examinations Why should not drivers of automobiles be required to take such an examination before being licensed to drive a machine? The conservation of life would seem to demand this as much as the requirement for drivers of other sorts of engines which provide motive power for conveyance of human beings

Probably it would be considered too radical to demand that the mental qualifications of drivers of automobiles should also be ascertained. If the morons and individuals with lesser mental capacities were excluded from the driver class, there would be an immense reduction of accidents. This ideal may be the subject of future legislative consideration. If presented in any feasible form, it would un doubtedly meet with universal approval and

support

Annual Graduate Fortnight

The first Fortnight will be held October 1st to 14th, 1928, and will be devoted to the problem of ageing and of old age. Special consideration will be given to the early recognition and prevention of disturbances often not the result of ageing but its cause

The mornings and early afternoons will be given to clinical lectures, coordinated clinics and demonstrations in teaching hospitals of the city. In the late afternoons and evenings well known authorities of America and Europe will discuss the general subject from many viewpoints.

It is planned to have a subject chosen each year which is of outstanding importance in the practice of medicine and surgery and which will be approached from every available angle with the least loss of time and the greatest possible opportunity to be offered to physicians from out of town

The profession generally is invited to attend No fees will be charged

A preliminary announcement of this year's program will shortly be made

CASE REPORTS AT THE ANNUAL MEETING

The April issue of the Atlantic Medical Monthly contains a call for volunteer case reports, which will be a feature of the annual meeting of the Pennsylvania State Medical Society, to be held October 1 to 4, 1928, in Allentown The following extracts will show the scope of this novel feature—Editor's note

General Meeting—8 Case Reports of 5 minutes each

Section on Medicine—8 Case Reports of 5 minutes each

Section on Surgery—8 Case Reports of 5 minutes each

Section on Pediatrics—8 Case Reports of 5 minutes each

Section on Eye, Lar, Nose and Throat—5 Case Reports of 10 minutes each

Section on Urology—8 Case Reports of 5 minutes each

For publication in the Atlantic Medical Journal, the 5-minute case reports will be limited to 1,000 words, and the 10-minute case reports to 1,500 words

In the General Meeting and Sections on Medicine, Surgery and Pediatrics, 15 minutes will be allowed for general discussion of these case reports, and 5 minutes for discussion in the Eye, Ear, Nose and Throat section

Volunteer papers, with the titles and abstracts, will be considered by the Committee on Scientific Work on or before May 1, 1928, but the Committee reserves the right to reject a paper if it is not deemed of sufficient merit, or should it not fit in with the skeleton program tentatively planned at its February meeting

RABIES

Dog fanciers sometimes deny that such a disease as rabies exists although such statements are made with less frequency than formerly. The same group sometimes say that human rabies is only an imaginary disease. Physicians know that rabies occurs in human beings with considerable frequency, and they recognize the

truthfulness of the following editorial in the March 8th issue of New England Journal of Medicine—Editor's note

There should be no death from human rabies That such a death should occur in an enlightened community is a serious reflection on the medical profession and on the public at large No physician of standing should tolerate a supine attitude towards prophylactic treatment, especially in view of the fact that animal rabies is in the community and public opinion is not strong enough to back up the police and other protecting agencies in their attempt to wipe it out. In spite of the ninetyday muzzling law now in force, there have been many stray, and not a few rabid, dogs on our streets The medical profession can greatly augment the efforts of the State Commissioner of Health by enlightening that part of the public with which they are in constant contact, their patients Such measures help, sometimes far beyond our hopes, but let it also be known that no physician in practice ever takes any steps other than the strongest urgings on his part to insist that all patients bitten by animals take the Pasteur treatment at once

It has been the misfortune, this winter, of one of our largest hospitals to have two cases of human rabies die within its Both patients, one sevwalls enty and the other nineteen, died a death that can only be described as horrible The families of these poor victims perhaps suffer the most, in view of the knowledge that the patient's one chance of life was not given to him And, yet, one hopes that the lesson is not in vain associated with these deaths are hardly likely to forget nor are they likely, as times goes on, to fail to use early Pasteur treatment in all cases of dogbite, or to spread the knowledge that human rabies is a disease, always fatal but made practically preventable

SEASICKNESS CURED BY SODIUM NITRITE

The Journal of the American Medical Association for April 14 contains the following article on sodium nitrite in seasickness by J F Pearcy, Ph D, and D B Hayden, M D, of Chicago, who write from the University of Chicago School of Medicine and the Department of Otolaryngology of Rush Medical College

"During a study of the effects of blood pressure on the labyrinthine function, we were impressed by the depressant effect of sodium nitrite on the vestibular responses. The results of these studies are in process of preparation for publication. In these studies it was shown that by lowering normal blood pressure to between 95 and 105 mm of mercury the nysstagmus after rotation was greatly diminished, and past pointing was also much diminished and even disappeared entirely in some instances.

"Believing that seasickness is due mostly, if not completely, to overstimulation of the vestibule, we felt that the nitrites offered a direct attack at the long sought but never attained cure for the terrible malady of the ocean voyage Consequently, as one of us (DBH) was about to cross the Atlantic, we decided to put the theory to the test Fate was against us on the trip across for no one suffered mal de mer On the return trip there were sixteen suffering from seasickness They were all given one of the usual treatments, namely, subcutaneous injections of epine-phrine hydrochloride For our test the patients were divided into two groups, eight to serve as controls and eight to have nitrite treatment The groups were chosen with the effort to have them as equal in symptomatol-The members of the control ogy as possible group were prostrated on the average two days, and there was not much variation from that period The members of the other group were given from 3 to 5 grains (02 to 03 Gm) of sodium nitrite every two hours until they experienced relief The average period of time before the members of this group were free from ocular nystagmus, vertigo, ataxia and nausea, and were comfortable on deck and able to eat meals was four hours! These persons did not suffer from any recurrence of symptoms

"Although this work has a sound experimental basis, the actual tests having been adequately controlled and 100 per cent of cures obtained, we expect to use nitrite in a much greater series before drawing final conclusions. We are certain that they will cure many cases of seasickness but it is possible that there are cases that will not be cured."

PRESIDENT'S ADDRESS—THE ART OF MEDICINE*

By JAMES E SADLIER, M.D., F.A.CS, POUGHKEEPSIE, N Y

As we consider in retrospect the scientific achievements of medicine during the past half century we are impressed by the multitude of scientific discoveries which have been made, the importance of which can scarcely be estimated, neither can their worth, in conserving human life, be evaluated It has been a Golden Era in scientific medical advancement, and one wishes he could pause for a moment and give due recognition to a few of the thousands of research workers and investigators who, following the trail blazed by Morton, Pasteur, Lister and Koch, have made this world a reasonably safe place in which to live, and that, in spite of its ever increasing density of population and its segregation in the urban sections Time will not permit me to dwell upon this phase of our scientific advancement with its deeds of bravery and self sacrifice, of discouraging failures and brilliant successes Enough for me to say that in the history of medicine of the past half century there are the written and published facts relating to the progress that has been made, likewise in the hearts of the people there will ever, over the future generations, be a grateful recognition, which will give credit and honor to the profession which, without thought of self, has succeeded in advancing the science of medicine far beyond the progress made along other lines of endeavor No profession has made such wonderful strides as has ours and especially is this true of the past quarter of a century Indeed the advance has been so great and the relative security to life so enhanced that it is difficult for the present generation to visualize the danger to life and the suffering that existed in the old days of ignorance, disease and pestilence. Progress in the scientific advancement of medicine has been so great that should a surgeon to-day have the same mortality in his practice that appertained in the nineties he would be a proper subject for investigation The advance in scientific knowledge has been so rapid that, at a recent Health Conference, Surgeon General Hugh S Cumming made a plea for the subordination of research to the applica-

 Delivered at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y May 22 1928. tion, in public health work, of the knowledge now at our command. Whilst we cannot agree to this thought of limitation of investigation by research workers we are impressed by the significance of the remark as indicating the progress in scientific medicine and the necessity of putting in practice the known and established methods of disease prevention and cure, thereby obtaining for the community and the individual the advantages to be obtained through elevation of the Art of Medicine to the high standard now enjoyed by scientific medicine. Allow me to quote from the Presidential Address of Dr. Wendell C. Phillips

"The history of no other science contains brighter pages than those illumined by the scientific conquests of the great men of medicine. The new developments in medical science have created the necessity for changes in modes, methods and economics so far reaching as to affect all phases of national, family and individual life.

"The physician both of the present and of the future must be an integral part of our civilization and much concerned with its changes" (Jour

A M.A Vol 86, April 24, 1926)

We realize the vastness of the unexplored and unchartered territory in scientific medicine still left for present and future investigators in the special field of research, aided, we hope, by a closer contact with the clinician than has existed heretofore. Turning now from the scientific aspects of medicine to the practical application of the knowledge possessed—to what extent are we utilizing the knowledge gained to make it productive in the prevention of disease, the lessening of human suffering and the prolongation of life? Herein lies the duty of the medical profession of to-day, to give the people the results to be obtained from the progress which has accrued from scientific investigation

The medical schools of this country, with very few exceptions, are producing a high grade class of physicians with a broad comprehensive view of their duties and responsibilities as medical men. It is understood that methods of instruction cannot be standardized. Widely different views are entertained as to just what should be

of medicine. Perhaps at the present time they could be used to a greater extent than they are by the Internist who does not seem to realize as fully as the other specialists the advantages to be obtained from proper hospitalization and super-Undoubtedly this will vised care of patients gradually be overcome and the home treatment of disease be much reduced Furthermore it is reasonable to assume that the modern plan of caring for established disease in hospitals, with the utilization of laboratory facilities, the Hospital Conference and the personal contact with the various specialists will gradually eliminate the former more individualistic type of physician and in his place develop the broader medical man of the present day who realizes the necessity for cooperation with others and the utilization of all beneficial agencies for the proper performance of his work in curative medicine. Realizing this in the diagnosis and treatment of disease means that it will be but one step farther in advance to recognize the importance of adopting similar methods in developing that newer phase of our work which has to do with the prevention of disease, and the proper discharge of our duties as custodians and leaders in all that has to do with civic medicine and the development of an improved Public Health condition in our country In no other field of medicine is there such woeful lack of application of knowledge which we possess

Dr William H Welch has said -

"When a Koch discovers the tubercle bacilli, a Banting discovers insulin for the relief of diabetes, or a Von Behring an antitoxin for the cure of diphtheria, or a Park demonstrates the value of the toxin-antitoxin for the prevention of diphtheria, the world draws a long breath as if saying to itself, 'Now we are rid of that terror which has haunted the human race for centuries' It then straightway forgets and goes on its way comfortably assuming that of course the great discovery, or invention, is being carried into effect.

"The actual facts are quite different A few people, those of unusual initiative, or ample means, or who happen to be under the care of exceptionally alert physicians, or within the jurisdiction of exceptionally competent health officers, receive the benefits of the new discoveries, but the great mass of the human race goes on as before, and the death rate from these diseases is reduced slowly and over long periods of time

"In fact, the health field has a woefully ineffective distribution service, as compared with
the laboratories of the world. We know how
to do a lot of things which we do not do, or
do on a wretchedly small scale. Few of the
great discoveries of preventive medicine, except
the prevention of yellow fever, are anywhere
nearly fully applied."

We are conscious that there is an ever increasing recognition upon the part of the intelligent public that the art of preventive medicine has not kept pace with the known scientific advances and it is for the physician of the present and future to so conduct his activities as to bring preventive medicine to that increasingly high standard as an art that curative medicine now enjoys veloping the art of preventive medicine we must ever recognize the duty and responsibility of the medical man to assume the initiative and to lead along correct lines of procedure which will insure unity of action and harmonious agreement between the various agencies which work, and should cooperate, in this field of endeavor Medical men have been so preoccupied with curative medicine that they have failed in many instances to take over this newer activity and hence lay organizations have appropriated the field and often indeed with the consent of the physicians Every physician must concede the vital need of lay organizations in public health work are indispensable in assisting in the teaching of preventive medicine, in arousing the public mind to the ever present need of personal hygiene and the anticipation of disease or early recognition of developing pathology, in encouraging the development of facilities for the physician by which he can practice better medicine of both a curative and preventive type, in stimulating a demand for medical service at a time when proper treatment can be applied with the least hazard to One could go on indefinitely enumerating the benefits and advantages to accrue from a harmonious interlocking of the activities of these organizations with our medical body. In this great field of human activity there must be a recognition that medical men unaided cannot do full justice to the art of medicine without having at their command assistance from outside agencies. In this work there is glory enough for all and there is a proper sphere of usefulness for each type of service to humanity in our endeavor to prevent or cure disease But in accepting the assistance of lay agencies we should be ever mindful of the fact that by reason of his particular type of education the physician is basically trained to be the leader in such health work, and in those communities where we find the physicians exercising a gentle and friendly leadership over lay organizations and directing the health activities of their community we note a more advanced public health condition and better progress in preventive medicine. We are for tunate in having several such counties in this state and they indicate a blazed trail of progress which wisdom would prompt us to follow supervisors in one of these counties were questioned as to the possible advantages of a county health unit and the reply of the chairman was "If our physicians desire it and feel that it would advance health conditions we will make

taught the under graduate, and many of us feel that too much time is being devoted to the laboratory side and too little to the practical clinical phases of medicine which, in the final analysis, represents to a considerable degree, the real worth of the man in his future work. My only criticism of present teaching of medicine would be along the line of stressing the importance of a more practical clinical teaching and that the under graduate be impressed to a greater extent with the importance of the subject of Preventive Medicine so that he fully understands that his future life work carries with it a broad civic responsibility to render service along all recognized lines of Preventive Medicine as well as the actual care of established disease I am not one of those who desires a reduction in the present scope of under graduate teaching, although I believe that changes might be instituted leaning towards increased development of the man as a clinician with a greater sense of responsibility in Civic medicine, Public Health, and the Prevention of Too many of our young physicians approach the practice of medicine with an inadequate sense of their duty to both their Profession and the community from this standpoint Early in their career these young practitioners should realize that, by reason of their medical education, they are members of a profession which should assume the leadership in all matters appertaining to prevention as well as the diagnosis and treatment of disease, and that it is as much a duty to prevent illness as to care for that which is already developed

It has been a personal observation over years that we do not give sufficient importance to the early symptoms indicating a possible change from health to disease Physiology fades into pathology slowly and somewhat insidiously but not without evidences of the changes even though slight in These early initial signs of disturbed function depend in type upon the organ involved To the patient they represent something which has not heretofore existed and may or may not produce concern, depending largely upon the intelligence of the person To the physician they should suggest a possible change from normal to abnormal function, from physiology to possible pathology, and should lead to an investigation of the particular organ or organs suspected and not be deferred until, by reason of a large group of symptoms it becomes relatively easy to determine the diagnosis, but frequently too late for cure to be obtained This means adequate painstaking history and examination which frequently leads to the early recognition of diseased conditions at a time when appropriate treatment will eradicate them

Two years of office as President-Elect and President of your State Medical Society has presented a wonderful opportunity for me to get acquainted with the physicians of this state, observe the quality of service they are rendering

to the sick, the type and character of the men who make up the great rank and file of the field workers of our profession, to note the environment in which and the equipment with which they practice the healing art It has been a source of deep and increasing gratification to observe the excellent type of scientific medical care that is rendered our citizens by the medical profession of our state There is no question that curative medicine is being practiced increasingly well and that the profession as a body is eager in its desire to render the most efficient service possible One notes with pride the large and enthusiastic audi ences gathered at the various county society meetings, the splendid reception accorded our post graduate instruction courses, the interest in staff meetings of hospitals and the recognition that they constitute still another method of utilizing the vast clinical resources of such institutions for educational purposes Everywhere one turns in the state he notes the advancing progress in studying the science of medicine and its consistent application to the diagnosis and treatment of disease Physicians and laymen alike are recognizing the importance of hospitalization of the sick and as a result new hospitals are being developed in increasing numbers, old institutions are being enlarged, clinics and laboratories are being estab. lished, thus demonstrating that the present hos pital with its up to date equipment is more and more coming to fill a real need in our modern life and the medical men in a county which has no general hospital,—and there are still a few such counties—are seriously and almost hopelessly handicapped in their effort to care for disease as it should be cared for in this present age. particularly wish to stress the growing importance of the city of the third class as a hospital and medical center, not only for it citizens but for those of a vast area of surrounding territory We are noting in these small cities throughout the state, hospitals of a very modern type fully equipped and in a position to care for all types Medical men have recognized these of disease changing conditions in their service to the sick, and have qualified themselves to meet the requirements of these hospitals so that to-day we find such institutions enjoying the confidence and support of the community in which they are located and the end result studies of patients treated compares favorably with the older and more advanced hospitals of our cities of the first and second The small city as a medical center is becoming a very important factor in lessening the damage which seemed likely to accrue from the very positive shortage of physicians which exists Furthermore it gives to the in rural sections young physician a proper environment, adequate facilities for study and work, the advantages to be obtained from contact and interchange of thought with members of his own profession One can readily visualize how these institutions are to be a grand step upward for the science and art

doing our whole duty in immunizing children

against diphtheria

"The health of the people of the State of New York in 1927 was exceptionally good. The total number of deaths was less than a year ago by more than ten thousand, mainly because of a lessened volume of mortality from tuberculosis, pneumonia, and diseases of the heart and kidneys. The death rate (12.3 per 1,000 population) was never lower and was equalled but once in forty-three years. Infant mortality (59 deaths under one year per 1,000 live births) was the lowest recorded since 1904, when these deaths were first compiled separately. Mortality from most of the diseases of childhood, with the exception of Diphtheria, also showed a gratifying decrease."

We recognize that in spite of disease and all other obstacles and handicaps, human life is gradually being lengthened and future generations may, with confidence, look forward to a longer and healthier span of life than was accorded their progenitors. We note with pride the fact that in the last half century, the average length of life has been extended some fifteen years, much of which has been accomplished through lessening mortality during the early years of life Whilst this increased longevity is something much to be desired, it is not comparable with that more to be desired condition, the maintenance of Length of life means little unless it is associated with an abundance of health which makes sustained existence desirable and permits of normal usefulness and activities unhandicapped by the limitations of disease Much that has been accomplished in limiting morbidity and mortality in the early years of life has been the result of medical men paying closer attention to the hygiene of the child, together with reasonable and proper observation and examination at a time when the child is in apparent health coupled with sound advice to mothers has revolutionized the entire question of Pediatrics and made that specialty the one which is the most advanced in the question of disease prevention, and when our profession recognizes that similar methods should appertain throughout life and that the human should be examined and advised when in apparent health, and such examinations and advice be properly recorded and filed, we will then anticipate much that now leads to mortality or incapacity Periodic Health Examination is sure to become a standard procedure, and in no other way will we be able to properly anticipate some diseases or be enabled to diagnose and care for them during the early and curable stages No chapter in the life history of a physician's work is so pathetic as that which deals with the patient who has passed into the incurable stage before applying for relief Health examinations are going to forestall much of this needless waste of life. The public is beginning to demand this service and is seeking means to have it applied. We, the medical men of this country, must see

to it that this newer phase in the art of medicine is developed into a great instrument for recognition or prevention of disease. We shall not be true to the time honored standards of our profession unless we accomplish this desired objective. Already our Medical Colleges have recognized the necessity of adding to their curriculum the teaching of this most important subject and soon our younger physicians will naturally assume this as one of their activities just as they now look forward to the diagnosis and treatment of disease

We look forward to a great future for preventive medicine when, by reason of health examinations and an improved personal hygiene, much that is now costing human life will be prevented or cared for early There are those amongst us who believe that in the field of personal hygiene will be most of the conquest of medicine in the next half century Personal hygiene means so living as to build up the body to such a standard that the normal powers will be fortified to their greatest possible extent. This will be accomplished by greater use of rest, diet, exercise, proper clothing, sunlight, normal adjustment of work and play, seeing to it that no one organ has an increased stress of work, elimination of focal sources of infection and in all ways encouraging a healthy functioning of all organs Such ideal living will accomplish and produce a race most resistant to disease

Recognizing the fact that for over one hundred and twenty-five years we have been privileged, through the great discovery of Jenner, to have at our command the eradication of smallpox by vaccination, we, as a profession, feel humiliated and mortified to know that during the year 1926 the United States of America reported more cases of smallpox than any other country outside of Asia, and that during the last fifteen years there has been reported from this country somewhere in the neighborhood of 700;-000 cases For the year 1925 there was reported about 40,000 cases, and for 1926 the number was 33,752 Compare this with the fact that in certain European countries and in Japan, where vaccination is compulsory, there is a complete or almost complete elimination of the disease This suggests that our American freedom of thought, speech and act can, under certain conditions, controvert and nullify one of the greatest scientific advances that mankind has received

"It is paradoxical that the nation which reclaimed the tropics for man by banishing Yellow Fever and made the lethal regions of Panama safe for an inter-oceanic canal should be so lax about vaccinating against smallpox. The medical profession, the press and the government should unite in an unceasing campaign to expose the fallacies of the anti-vaccinationists until the United States abandons its deplorable pre-eminence in this horrible disease"

—(Editorial, Medical Week, May 21, 1927)

the necessary appropriation" The family doctor is and always has been the determining factor in all successful plans for practicing the art of disease prevention and cure

Individual physicians and organized medical bodies should recognize the close relationship existing between our activities and those of our State Department of Health with its ramifications into the various counties and its working force consisting largely of medical men, mostly members of our State Medical Society, who, in their capacity as health officers, are responsible for the public health in their community, in so far as applies to communicable disease limitation of communicable disease represents only a modest portion of what can be accomplished in the prevention of disease, providing each physician accepts it as his duty and cooperates with the Health Department to the fullest extent and also insistently practices and teaches the prevention of disease in that large field where the Department of Health does not or should not enter Therefore, it would seem as though there should be a very close alliance between the Department of Health and the County Medical Society In no other way is it possible to push on to its fullest extent this newer phase of the physician's work In no disease is this better demonstrated than in tuberculosis where our work, to be successful, requires the active cooperation to a maximum extent of physicians, Departments of Health and lay organizations Not for the purpose of compiling statistics which may not be used, but that by proper education of the people, judicious and well thought out publicity, determination as to who are tuberculous and who are the contact cases, each shall receive the attention required, to either prevent the spread of the disease, or in the contact case, be treated whilst yet in a curable stage. We are proud of the accomplishment in the reduction of the death rate and incidence of tuberculosis to about 50 per cent of what it was twenty years ago state at the present time the average annual mortality rate is about 78 per 100,000 people, neverheless we are still a long way from the desired goal, which should be an almost complete eradication of the disease. But we note with pride that in a certain few counties where there has been most intensive tuberculosis work and where there is active participation and leadership by the medical organization of the county and a close interlocking with all public health workers that the tuberculosis rate has been further reduced to such an extent that their figure is from 38 to 44 per 100,000 people Needless to say that in those counties, case finding, adequate reporting, and examination of contacts have been the most important factors in the production of such The first step towards the control of tuberculosis is the discovery of those who have the disease and the proper reporting of them to

the Department of Health There has been a steady decline in the mortality from tuberculosis over the past two decades so that now instead of its having the unenviable reputation of standing at the head of the column of causes of death, it occupies position No 6 Yet as we study the reduction in mortality from the age group standpoint we are impressed with the startling fact that in females the age group between 12 and 24 is not having the same reduction as appertains in other age groups, either male or female We ask ourselves why this is so Is it a question of the personal hygiene of that age and sex? Is there something about the present life of the fu ture mothers of our race that is making them less resistent to the invasion of the bacillus of tuberculosis? The answer to these questions in the science and art of preventive medicine should have careful consideration and thought by the physicians and Departments of Health working Amongst the together in this common cause many other activities where there should be a common unity of action between the three great recognized agencies, viz Physicians, Depart ments of Health and Lay Organizations, and greater interest and more intensive action established is in the prevention of Diphtheria by im-Every physician should recognize her personal responsibility in seeing to it that so important a health measure as this receives his whole hearted support and intensive work For the medical men to depend on health officials to carry on this work is shirking a real responsibility and detracting from the prestige of the family physician who above all others should aim to guard and protect his clientele from a disease which is soon to become a public disgrace to any The gradually decreasing mortality community from this disease since about 1890, when it was responsible for 6,500 deaths annually in this state, to a point where for 1927 the number was 981 indicates effective work done by both health officials and physicians, and next to Yellow Fever, represents the best instance of limitation of disease by application of known scientific advance in treatment It is a chapter in the Art of Medicine of which we should be proud As a result of scientific investigation we now have the means of preventing this disease but it remains for the physicians to eradicate it The present mortality from Diphtheria is largely, at least 60%, during the pre-school age and no health or lay agencies can adequately reach this group It is essentially the task of the general practitioner and upon him rests the responsibility in this particular field of He alone has an entree preventive medicine. into the home circle and his insistence will be the educational force which will eventually eliminate The following quoted from the February 13, 1928, Bulletin of our State Departthis disease ment of Health has much to encourage us, yet indicates in no uncertain terms that we are not

doing our whole duty in immunizing children

against diphtheria

"The health of the people of the State of New York in 1927 was exceptionally good. The total number of deaths was less than a year ago by more than ten thousand, mainly because of a lessened volume of mortality from tuberculosis, pneumonia, and diseases of the heart and kidneys. The death rate (12.3 per 1,000 population) was never lower and was equalled but once in forty-three years. the Department of Health There has been a steady decline in the mortality from tuberculosis over the past two decades so that now instead of its having the unenviable reputation of standing at the head of the column of causes of death, it occupies position No 6 Yet as we study the reduction in mortality from the age group standpoint we are impressed with the startling fact that in females the age group between 12 and 24 is not having the same reduction as appertains in other age groups, either male or female We ask ourselves why this is so Is it a question of the personal hygiene of that age and sex? Is there something about the present life of the fu ture mothers of our race that is making them less resistent to the invasion of the bacillus of \ tuberculosis? The answer to these questions in the science and art of preventive medicine should have careful consideration and thought by the physicians and Departments of Health working together in this common cause many other activities where there should be a common unity of action between the three great recognized agencies, viz Physicians, Depart ments of Health and Lay Organizations, and greater interest and more intensive action established is in the prevention of Diphtheria by im-Every physician should recognize her personal responsibility in seeing to it that so important a health measure as this receives his whole hearted support and intensive work For the medical men to depend on health officials to carry on this work is shirking a real responsibility and detracting from the prestige of the family physician who above all others should aim to guard and protect his clientele from a disease which is soon to become a public disgrace to any community The gradually decreasing mortality from this disease since about 1890, when it was responsible for 6,500 deaths annually in this state, to a point where for 1927 the number was 981 indicates effective work done by both health officials and physicians, and next to Yellow Fever, represents the best instance of limitation of disease by application of known scientific advance in treatment It is a chapter in the Art of Medicine of which we should be proud As a result of scientific investigation we now have the means of preventing this disease but it remains for the physicians to eradicate it. The present mortality from Diphtheria is largely, at least 60%, during the pre-school age and no health or lay agencies can adequately reach this group It is essentially the task of the general practitioner and upon him rests the responsibility in this particular field of preventive medicine. He alone has an entree into the home circle and his insistence will be the educational force which will eventually eliminate The following quoted from the this disease February 13, 1928, Bulletin of our State Department of Health has much to encourage us, yet indicates in no uncertain terms that we are not

a more or less harmless anomaly—glycosuria—more is required to enable us to determine whether the so-called "renal" type is as innocuous as some would lead us to infer

II HORMONE AND ROLF OF THE PANCREAS

Whether we believe that insulin represents the sole pancreatic hormone we must concentrate upon the pancreas chiefly, in diabetes, for causative factors, as the importance of that organ for the metabolism of sugar is recognized even if we admit the role of the liver, kidney, nerve centres, and ductless glands

Falta¹ in alluding to the experiments of V Mering and Minkowski mentions the theory that the pancreatic hormone is deemed to be derived from either or both the glandular acini (external secretion) and the Islands of Langerhans (internal secretion). He also refers to well known experiments in canine pancreatectomy resulting in glycosuría and hyperglycemia. As to how the pancreas takes part in carbohydrate metabolism he refers to the pancreatocentric view and the reverse idea of "nervous," thyroid, and other remote stimuli

He alludes to the belief that the presence of pancreatic juice in the intestine is not necessary for the normal course of carbohydrate metabolism, thus emphasizing the role of the internal secretion, and that too, we believe

prior to the Banting discovery

Reference is also made to the admission (then) of the functional independence of the insular chemistry and a description of how the hormone from the islands is given principally to the venous blood and carried to the liver, and how, when the hormone is absent, marked excretion of sugar occurs. There is put forward the theory, also, of a possible antagonism between pancreatic hormone and adrenalin

In further reference to the role of the pancreas, Harris² describes diabetes as essentially due to deficient secretion of insulin by the Islands, and suggests that it should be called hypo-insulinism, claiming that diabetes bears the same relation to the internal secretion of the pancreas that myvedema or cretinism (hypothyroidism) bears to that of the thyroid gland. And in reference to etiology he has stated that it seems probable that as one of the causes of hyperinsulinism is the excessive ingestion of glucose-forming food, there results on account of over activity, induced by over eating, an exhaustion of the Islands and hypoinsulinism (diabetes) follows

On this hypothesis it is easy to understand how obesity so often precedes diabetes and how it may be that every obese person with glycosuria have been understood to be potential diabetics But we hope to show later on that such may

not be the case

If the Islands of Langerh

If the Islands of Langerhans become exhausted easily, hypoinsulinism follows, but the

suggestion which we are prone to stress is, that the Islands do not become exhausted easily in a great number of cases where over-activity is necessary in the effort to provide for excessive metabolism. That the intake for periods of time, not only of carbohydrate food in excess, even to the point of producing a moderate, or in some cases, a severe degree of glycosuria, irrespective of the threshold, may go on for a long time (many years) without affecting the general health or eventually developing into cases of true diabetes mellitus

In this connection it is interesting to note the suggestion of Harris that as excessive hunger is a symptom of hyperglycemia, it may be that normal hunger is the call for glucose and that it may be in part, or wholly, of pancreatic origin, and not entirely an expression of an

empty stomach

Banting³ in a paper read at an International Conference in Health Problems in 1924 sums up the role of the pancreas as he conceives it in so far as insular participation is concerned

"When glucose is absorbed into the blood stream, there is an increased percentage of sugar in the blood which stimulates the Islands of Langerhans to pour out their secretion Normal islet cells have a tremendous reserve and may cause very large amounts of glucose to be metabolized When, as in diabetes mellitus, the functional ability of the islet cells is impaired by nerve strain, infection, changes in the blood supply or overweight, the extra reserves are found wanting and sugar, if given in large amounts, remains circulating in the blood stream in a higher percentage and for a longer period of time than normal creased percentage of sugar in the blood is recognized by the kidney, and sugar is excreted in the urine

Allusion to the role of the pancreas could be indefinitely continued. For example, Allen makes a distinction between glycosuria and diabetes, pointing out that in non-diabetic animals there is no limit to the power of utilization of sugar, except death, that in various forms of glycosuria dextrose always produces a limitation of the amount of urine, never a diuresis as in diabetes

Attention to the fact might be drawn that the nervous system can influence the pancreatic hormone, which Falta also concludes

In any event, it appears to remain unquestioned whether one lays more stress upon one idea, or another, as in the contention of changes in the nervous cell, etc., that the influence of the Islands of Langerhans remains uppermost

III INCIDENCE

It has been said that the number of diabetic patients in the United States is 1,000,000 As that may be, it is admittedly a common occurrence.

From a careful study of Maternal Mortality in this country and especially in this state. I am convinced that this is one of the greatest unsolved problems with which we are confronted at the present time. One factor which especially distinguishes this particular field from all other causes of death is that the number of maternal deaths remains, in volume, almost stationary As we improve our knowledge along other lines of work and apply that knowledge to the eradication of disease, we are rewarded by a lessening death rate But not so in maternal conditions, where for years it has not materially changed and we are confronted with the tragic fact that in this state one mother out of every one hundred and seventy-one will lose her life as a result of what has usually been considered a physiological This figure has remained relatively the same for the past twelve years, constituting one out of every nine deaths in women of the age group 15-44 years and was only exceeded by the death rate from tuberculosis Nevertheless, we as a state do not stand alone in this lack of decrease in maternal mortality In fact, our state has a better rate than most of the states and only five have a lower one than ours also a fact that many foreign countries have maternal death rates which are grave sources of concern, even New Zealand, a country noted for the excellence of its health measures, has not yet lessened its maternal mortality to an appreciable On the other hand we recognize certain countries that have materially lessened their death rate amongst mothers For instance Denmark loses but one out of 600, and quite similar In England and Wales is the rate for Holland it is somewhere in the vicinity of 1 to 300. With such improved conditions in these three countries is it not conceivable that this country and this state can, by a proper recognition of our condition, gradually lessen our maternal mortality and remove this blot from our medical record? Our general death rate in this state during the past ten years has declined about 15% and our

infant mortality has decreased 31% We lengthen the span of human life, we save an increasing number of babies but altogether too many of the mothers are lost Why is this so? In times gone by we would have been disposed to have laid the blame to the ministrations of the midwife, but a careful study of the statistics of the work done by the lessening number of midwives dem onstrates that their maternal mortality is not greater than that where medical men were in Formerly we were impressed by the fact that the maternal mortality was greatest in the rural sections of the state where hospital environment and facilities were not available for a considerable number of these cases But of late this seems to have been reversed and now there is found the greatest mortality in the urban sec-So that with a decreasing maternal mortality in the rural sections we have an increasing rate in the urban portion, the one just about counterbalancing the other, hence for the state as a whole the rate is about stationary There is much food for thought in this peculiar reversal of maternal mortality rate Investigation of this problem may be very helpful in determining the actual causation of the mortality in the state

It is beyond the plan and scope of this address to endeavor to analyze the reasons for this excessive maternal mortality, but one cannot help feeling that perhaps it may be due to unnecessary interference with what should be a normal physiological process, thus transforming it into a pathological process. Whether this be so or not we must recognize that this great and seemingly unwarranted loss of life can only be lessened by painstaking prenatal care, intelligent, skilful and well considered delivery followed by detailed post partum care to an extent not always practiced

We, the medical profession of the state, must recognize our responsibility in seeing that childbirth is rendered safer for the mothers of the future and that this stigma of a high maternal mortality is removed from our state

opinions on the subject of diabetes with the conception obtained from the collection and study of life insurance experience viewed from the angle solely of prognosis, and that too, collectively considered

At the same time it is aimed to show how it is possible that investigators and authors have given less attention to the value of life insurance data, from the standpoint of mortality, than would seem to be warranted, in this important subject

While modern study has done much to aid us in discriminating between true diabetes and

gators, than whom there are no better, the finding of an amount of sugar in the urine of 3 per cent or less, and of a specific gravity of 1 025, could be disregarded and the case considered as standard, and no further investigation would be required " (The percentage must have been 3 per cent FGB) Substantially our studies confirm this view

It is possible that Joslin's prophetic utterance in 1921 when he said,⁵ "It is true that any day the discovery of an extract of the Islands of Langerhans may be made," may be so in a larger measure than was then believed (1921) when he said "Although a positive Benedict test does not prove a patient has diabetes, it does necessitate the further examination of the urine and often of the blood as well," inasmuch as it may come about that the routine test of true diabetes lies not so much in urinalysis, or a series of them, as in the determination of insular disfunction

IV STUDY IN MORTALITY

We tabulate below the result of a study of the papers of 596 individuals who have died from diabetes in recent years insured in the

Equitable Life.

In this connection, it is well to emphasize the fact that the study of death claims may be very misleading, masmuch as in any group of deaths from special causes, like diabetes, we rarely know the number of cases contained in the group in which these deaths occur and, unless we ascertain the exposure, that is, the number of lives exposed of which the deaths represent a certain proportion, the exhibit is unconvincing. The deductions often produce a prejudice which may not be justified.

We are able to obtain, however, some information of which the following is expressive

The average duration of the policies in force was nineteen years, ten months and seventeen days and the average age at entry was thirtyeight years, eleven months and eighteen days

From the meagre description as contained in the claim papers as to the duration of illness, when it was stated, we find the duration on the average two years and nine months This item is entirely inconsequential owing to the paucity of details contained in the evidence

The principal factors gleaned from this study

may be classified as follows

A There were very few early death losses

B The average duration of the policies was long

- C On examination at entry, the proportion of those distinctly overweight, was marked D 11 per cent in this group demonstrated.
- D 11 per cent in this group demonstrated, in the claim papers, a complicating or concurrent kidney condition
- E 8 per cent demonstrated a concurrent or complicating condition of myocarditis

- F 5 per cent had complicating or terminal pneumonias
- G 4 per cent showed complicating or concurrent conditions of arterio sclerosis

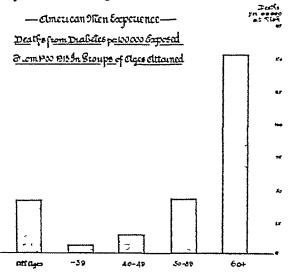

H 3 per cent had carbuncles

J Very few were classified as other than a

standard life at entry

Following is a photostat of a graphic illustration of the deaths from diabetes per 100,000 exposed from 1900—1915 in groups of "ages attained" derived from "American Men" Experience compiled by the Actuarial Society of America

Also we append a photostat showing graphically the deaths from diabetes among all risks insured in the Equitable Life, 1921 to 1925, per 100,000 Exposed in groups of "Ages Attained" for each of these years The drop from 1922-1923 and following years is noticeable and we believe has been found to be the case by other investigators

In respect to the study of death claims from diabetes in which it is noticeable that associated terminal conditions are frequently kidney lesions, it is interesting to note that according to Hatziegan of Cluj University Clinic⁷, there are three groups of cases in which albuminuria is associated with diabetes (1) albuminuria due to arteriosclerosis, with secondary lesions in the heart and the kidneys (2) albuminuria of epithelial origin due to an intercurrent disease, particularly tuberculosis, and (3) albuminuria without renal manifestations, alternating with glycosuria

For many years and before blood chemistry was studied it has been the practice in life insurance selection to take into consideration the presence of sugar in the urine, both by qualitative and quantitive analysis and decisions were arrived at (probably often erroneous) resulting therefrom Some companies not doing a substandard business, have considered that persistent

The Metropolitan Life Insurance Company reports (August, 1925) 1,800 fatal cases among its industrial policy holders during twelve months from February, 1924, to February, 1925

The Equitable Life Assurance Society of the United States paid the following claims, in the years stated, due to diabetes

		Death per 100,000
1010		Policy Holders
1918	175	26
1919	157	22
1920	146	18
1921	201	24
1922	215	24
1923	127	13
1924	142	13
1925	140	12
1926	138	11

We are not so much concerned with the relative frequency of diabetes as we are with the mortality in groups of cases known to be glycosuric

Allen has said that the significance of any given symptoms from a statistical standpoint could be established only be insurance companies

He further states that it might be assumed that whether diabetics are to be granted insurance or not, the company at least wishes to know whether diabetes is present at the time of the examination in order to make an intelligent decision, it being understood that there is a limit to the complexity of the examination

For example, he said that the practical decision is generally based on urinalyses, with or without the aid of carbohydrate test meals and blood analyses are generally considered impracticable for routine use, and he claimed that it was beyond dispute that many diagnoses were missed on this basis

While it is undoubtedly true that diagnoses are missed on that basis, it is probably equally, if not more, apparent that grave prognosis is anticipated without warrant by failure to make blood sugar determinations, and it is a hopeful sign of the times that more attention is being paid yearly to blood sugar analyses in the routine work, not only of life insurance companies, but diagnosticians in practice

Therefore, in the discussion of mortality, it becomes increasingly obvious that the term "diabetes" should not be applied loosely to all those who have glycosuria. At this point, it may be useful to allude to the different methods of observation by those who engage in the study of mortality statistics, dependent upon the point of view

The average clinician is concerned, generally speaking, with the type of glycosuria that is more or less advanced The insurance student

of mortality is concerned generally, with earlier and milder types

Various writers have drawn attention to the fact that the public owes a debt to the insurance companies in discovering early glycosuria

No less an authority than Joslin⁵ has said "The medical examiner and the doctor interested in diabetes have much in common, adding that the work of each is largely of a statistical nature and the success or failure is largely based on the courtesy employed in the gathering of statistics and their interpretation

It is a fact, however, that while these two classes of observers may have much in common, the statistics of the one are more likely to be of value than the statistics of the other, from the standpoint of mortality. What interests us from the insurance standpoint is the true "exit" of cases observed in this category, that is, death, be it from whatever cause

The true "entrance" into a class of observed diabetes is that date when glycosuria is first discovered to exist, whether it be from the observation of the subject's physician, or from a life insurance examination, but the true "exit" is a very different thing, inasmuch as in the experience of practitioners, or even hospitals and other institutions, the "exit" occurs when the patient is removed from observation, from one cause or another, be it improvement, transference, or death

It is a known fact that life insurance companies observe in a great number of cases, glycosuria, until death, the true "exit" because whether an application for life insurance is followed by a policy, or not, there may be, and often are, other policies granted, possibly, before its occurrence, and those under substandard plans issued to known glycosurics

Our studies in this connection are leading us more and more to observe that there are a great number of men and women who have glycosuria in various degrees of intensity for many years without any appreciable effect upon their mortality. Hence, it is, as Joshin suggests, the duty of every medical practitioner, as well as medical directors of life insurance companies, to carry the statistical method to the limit, bearing in mind the above facts that are so impressive when a large number of cases are studied statistically from the date of entrance into the category or class of diabetics, either real or potential, until death

Cook said in 1924,6 "that up until a few months ago, I think practically every underwriter felt that the finding of a trace of sugar in the urine of an applicant meant a very serious condition. About that time the Metropolitan under the leadership of such eminent men as Dr. Benedict and Dr. Folin, made the announcement that in the opinion of its investi

order to approximate an opinion as to longevity
The significance of the percentage of glycosuria as a prognostic aid has some value, as

mortality studies have supported this idea

That the amount of sugar in the urine is consequential, most will admit, that is, within certain limits. For instance, assuming that other conditions are the same, a group of glycosurics excreting on an average of say 5% of sugar in the urine is a different group from one showing say 5% of sugar on the average.

Our practice has been to divide (on a percentage basis) the total amount of sugar found, say in three specimens, by three and give the applicant credit for a specimen, or specimens, in which there is no sugar when we have a favorable blood sugar determination, thus materially reducing

the average

We have adapted this practice for the determination of the mortality rating according to our numerical schedule. Apparently, we were justified in considering that the greater the percent of glycosuria, the less favorable the risk

However, in those cases where we have a normal blood sugar determination we give credit, in obtaining the average, for the purpose of rating, to one or more specimens which have been

negative

Our mortality studies based not only on the mortality experience of the Equitable, accumulated prior to the practice of blood sugar studies, have led us to believe that the significance of glycosuma has been dependent upon both,

The incidence of glycosuria in a series of

urinalyses

B The per cent of sugar in the same series

While the future probably will demonstrate that our criterion was only partially logical, because it was based on the study of urine, rather than blood, we cannot but be imbued with the feeling that to rely solely upon blood chemistry almost to the exclusion of urinalysis, is really only a partial point of consideration, important as it is. We cannot take the view that renal glycosuria from the standpoint of mortality is altogether harmless.

Granted that this be correct, there appear to be certain other advantages in securing a series

of urmalyses as the following

- 1 Necessitates a number of specimens without which no reasonable conclusion may be obtained
- 2 Lessens the likelihood of prepared specimens
- 3 Gives, at least, some evidence of the continuity or intermittency of glycosuria
 - 4 Tests the sincerity of the applicant
- 5 Makes for better evidence as to the usefulness of blood sugar determinations
- 6 Gives us better evidence (when questionnaire is complete) of diet

In a general way our ratings (mortality assess-

ment) in glycosuria are based then, as described above, on a series of urinalyses which contain evidence not only of the presence or absence of sugar, but the amount, as well as the specific gravity, the presence or absence of acetone and diacetic acid, all aimed to be obtained in a standardized manner, and after a generous carbohydrate meal at such time when metabolism is presumed to be representative

The blood sugar determination cannot always be made as a matter of routine, but it is asked for, and generally obtained, in all cases which lend themselves to more complete methods of diagnosis and always where the amounts involved are considerable

Our ratings on a basis of numerical notation, contemplate blood sugar determinations for the most part which are taken into account in the following way. In averaging the amount of sugar in a given number of specimens, we give credit in determining the average for those specimens which are negative for sugar where we have a favorable blood sugar series, but not unless

We make no offer of insurance to those definitely deemed to be diabetic

From all available insurance statistics we are forced to conclude that, over a considerable period, the mortality in groups of individuals known to have glycosuria taken as a whole, is excessive. We shall have to admit, however, that up to 1924 or 1925, that these groups were composed of individuals few of whom were studied from the standpoint of blood chemistry. Hence, it is possible that the excess mortality may have occurred only in those who were truly diabetic. But this is not probable as our studies lead us to believe that pre-diabetic conditions must be taken into consideration such as, lowered sugar tolerance, unusual "threshold" and overweight, in which group we find many of the so-called "renal diabetics"

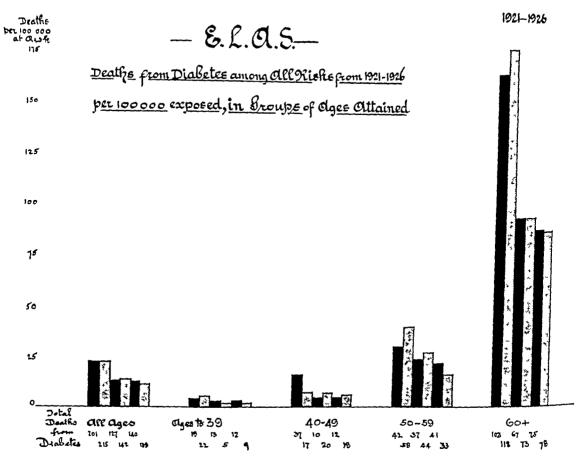

Our assumption is that there is a double criterion, first, urinary sugar, and second, but more important, blood sugar. In consequence, a balance for mortality values for each, without relying exclusively upon either one or the other.

V DIFFERENTIAL DIAGNOSIS

Joslin⁵ has said (1921) that the average length of life of diabetic cases, including all cases from infancy to old age, is at least seven years. In contrast to those sombre figures, it was good news to record that the duration of life in twenty-four fatal cases originally discovered on application for life insurance, was twelve years. The average length of life in these twenty-four cases on the onset of their disease was twenty-seven years.

We are not so much concerned, however, in discussing the average duration of life in a known class of diabetics, as we are to draw attention to the average duration of life in a glycosuria is a condition warranting invariable Others have based their judgment on quantitative analysis for sugar in the urine and have granted insurance dependent upon the

above and we think it will be admitted, from the standpoint of significance, that A presents a different picture than G, while the same cannot be said as of the difference between B and F.

per cent of glycosuria in specimens voided either fasting, or in the full tide of digestion. In these companies issuing substandard contracts the premium has been allotted in accordance with the quantity of glucose in the urine in a series of specimens so voided, irrespective of the total sugar output in a given time and of the fluid This percentage of glycosuria has become to be an important factor

Let us, in support of averaging the amounts of sugar occurring at different times in the same subject, take a group where at least four specimens are observed, each three hours after a noon carbohydrate meal and tabulate them as follows, assuming that in no case have we a case of glycosuria, where the amount of sugar exceeds 1 %

Α	5			
В	5	6		or some
С	5	5	6	— other
D	5	5	6	6 sequence
\mathbf{E}				6 of
F			6	5 incidence
G		6	5	5

and yet again a difference can be said to exist as between C and E, and etc

A and E are identical A and B differ somewhat A and C differ distinctly A and D differ considerably E and F compare as do A and B E and G compare as do A and C

Objection has been made to the practice of taking a number of specimens of urine, all or some of which contain sugar, which have been quantitatively analyzed therefor, and averaging the amount of sugar by dividing the total amount of sugar found in all the specimens by the number of specimens

At first blush there would seem to be so many objections to this practice instituted for purposes of classifying these cases from the standpoint of significance, as to discredit it all together

Hence, it is with reluctance that we propose to show that it may not be altogether without reason, as a rough guide in determining into which of several classes (degree of severity) of Compare, then, the horizontal lines in the known glycosurics a given case may be placed in the ability of the severe diabetic to burn glucose is markedly impaired and the excessive fat is incompletely oxidized giving rise to ketone bodies

From all the above, there are cogent reasons for including in insurance examinations not only a series of urinalyses, after reasonable carbohydrate intake, but test for acetone and diacetic acid, and blood sugar determination in cases where either the amount of the insurance demands especial care, or the question of differential diagnosis as between diabetes and glycosuria is involved

Allen in describing diabetes as a deficiency of the internal secretion of the Island of Langerhans, says that the name of the disease Diabetes should be kept distinct from that of the symptom Glycosuria, and that physicians making a diagnosis have sometimes employed these terms to convey an element of prognosis, calling the severe cases diabetes, and the milder and less progressive ones glycosuria, adding that though the prognostic distinction of mild and severe is correct, it is abundantly proved that all cases of all grades are true diabetes, except the small number which Joslin claims can be placed by definite tests in certain other definite categories

In the face of such dogmatic statements, one hesitates without very ample evidence, to disagree

Allen admits, however, that pancreatic insufficiency may be present without glycosuria, or any other of the classes of symptoms of diabetes, drawing attention to the fact that it may be present for months or years before the development of glycosuria, and allows the possibility of such persons dying of other causes, without their diabetes ever becoming manifest

If it is true that glycosuria is a symptom, with few exceptions, of diabetes, it is, on the other hand, abundantly evident from the study of insurance data, that glycosuria can, and does, occur in classes of individuals over long periods of time, without undue effect, provided there is no other symptom than glycosuria

If it can be shown that large groups of cases with moderate glycosuria give, collectively, mortalities better than might be expected from the above, and do not develop graver symptoms than glycosuria, for many years, and die of inter-current conditions, or have terminal complications eventually so significant as to be fatal in themselves after long periods of time, it seems almost necessary to so modify our nomenclature (if we can do nothing more) so as to avoid the application of the term diabetes to all conditions with glycosuria as a predominating symptom where, on the one hand, there are acute and fulminating symptoms with an undeniably grave prognosis, and where, on the other hand,

the condition appears by one symptom (glycosuria) only, and that, too, over long periods of time in an obviously chronic manner

Dr John¹⁴ describes a type called "Functional

Diabetes" as follows

"I There is apparently a mild type of early diabetes in which there is but a slight change in the Islands of Langerhans, which we may call "functional diabetes". This has been observed chinically for many years, and has been produced experimentally by Allen, Copp and Barclay, and others who have demonstrated a hydropic degeneration of the beta cells in such cases.

2 Under proper treatment, much restoration of function and a histological restoration of the

Islands of Langerhans may take place

3 In spite of apparent restoration of function, these cases will break down under undue strain

4 Once the presence of a diabetic status of any degree has been established, adherence to the prescribed diabetic regime should never cease, and the physician should maintain a continuous control"

Paullin¹⁵ is the authority for the statement that patients with renal glycosuria metabolize and store carbohydrate in the same way as normal persons and that the evidence is that they do not develop diabetes mellitus

Campbell 10 tabulates certain characteristics of renal glycosuria which help to separate it from diabetes mellitus, as follows

1 Absence of symptoms

2 Accidental discovery

3 Total glucose percentage (24 hours) small

4 No acetone

5 Increased carbohydrate intake not productive of a commensurate increase in glycosuria

6 Respiratory quotients after glucose ingestion rise to values around I, indicating normal utilization of carbohydrate

7 No tendency to progress under dietary conditions highly unfavorable to the true diabetic

8 Glycosuria can repeatedly be shown present while the blood at the same time shows normal

sugar content

Benign Glycosuria and Diabetes Holst¹⁶ investigated 150 persons rejected for life insurance from five to sixteen years previously on account of glycosuria. Only about 30 per cent of them had diabetes mellitus. The alimentary glycosuria tests do not furnish any differentiating signs beween harmless glycosuria and diabetes. Determination of the fasting blood sugar is sufficient for diagnosis and prognosis."

Knud Faber 17 quotes Holst 18 as follows

"In the examination of 163 patients who formerly had been declared by life insurance companies to be diabetics on account of a glycosuria, he was able to demonstrate the frequency of this benign form of glycosuria. Such a demonstration is obviously a great practical significance to the patient known class of those who have glycosuria, but not diabetes. In other words, we are more anxious from the statistical or mortality standpoint, to differentiate, if we can, between classes of known true diabetics and classes of those which cannot be said to have diabetes at all, although glycosurics

If we can arrive at a formula sufficiently descriptive for the one class and the other, we shall properly alter our views considerably in respect thereto. The statement of Joslin that individuals whose urines react in a slightly positive manner (sugar) should in diagnosis by life insurance companies be considered as having diabetes mellitus until the contrary is proven, may be considerably modified.

Therefore, in respect to differences which may actually be present at least from the mortality standpoint between these two conditions, the following opinions are of interest

Campbell¹⁰ emphasizes the necessity of carefully differentiating glucose from the other reducing substances in the urine and when glucose is actually present, the importance of distinguishing between the accidents and anomalies of carbohydrate metabolism and diabetes mellitus

Referring to the first sentence above quoted, we would like to call attention to the fact that there seems to be very good reason to believe that pentose is a reducing substance which has by no means the same significance as glucose and that it is a fairly frequent cause of erroneous conclusions

Hatlehol's^a research in thirty-eight diabetics showed that in seventeen cases of benign chronic glycosuria, a progressive tendency was not apparent in any instance

Katzklein® found that diabetes, associated with hypertension is milder than the type with normal blood pressure. Our experience seems to indicate that such is the case and in respect thereto, the following seems worthy of comment

Some years ago it was our practice in this office to ask for a specimen of urine for analysis in our laboratory in all cases where we found high blood pressure, on the assumption that as kidney lesions were admitted to be productive of high blood pressure, it was a means of safety to determine by careful laboratory analysis, whether or not albumin existed in these cases, although it might not have been demonstrated in a given medical examination

As time went on and after we had collected a great number of cases of high blood pressure, without finding any great number of cases of co-incident albuminuria, we discontinued the practice as a matter of routine, on the ground that it was not giving us any spe-

cial interesting data in this connection But about 1922 we began to notice that in cases of glycosuria in overweights, we were getting fairly often co-incident high blood pressure and we made record of these phenomena At that time it was deemed to be accidental, possibly due to the condition of hyper-nutrition which that group of overweight cases indicated

This became, however, much more numerous than we expected and there seemed to be at least a possibility that we were likely to obtain small amounts of sugar in our laboratory, perhaps overlooked in the original examination when there was recorded degrees of hyper-tension in some cases. This would not be incompatible with the fact that hypernutrition and hyper-tension go hand in hand and that hyper-nutrition often precedes gly-cosuria and the occurrence of what is apparently being described more and more as "renal diabetes"

Mohler¹¹ has reported a review of the history of forty-six patients who had a Systolic blood pressure of 150 or more and glycosuria

The object in alluding to these observations is to draw attention to what may be a step in the differentiation referred to under this section which is, that an elevated blood pressure, co-incident with glycosuria, in overweights, may be only a symptom of hypernutrition, as may glycosuria also be a symptom of that condition and that if the relative insufficiency of the insular hormone is the cause of glycosuria, it is only relative and it by no means follows that hypo-insulinism will necessarily result and a true diabetes

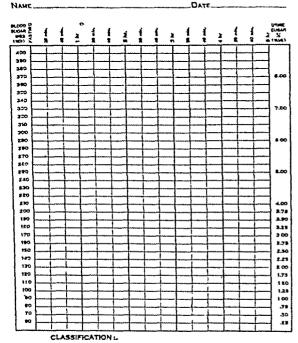

Umberg and Rosenberg¹² found that thirteen patients with harmless glycosuria were refractory to insulin. Another group of ten refractory patients had high blood sugar or considerable glycosuria but their disturbances were comparatively benign. The glycosuria was relatively independent of the glycemia in these cases. They did not regard them as true pancreatic diabetics.

That a moderate degree of permeability of the kidney to glucose can occur without any demonstrable defect in oxidation of carbohydrate was the opinion from data presented by Ladd and Richardson¹³ to show that a patient with renal glycosuria was able to utilize carbohydrate to the same extent as a normal individual. As a power to oxidize glucose was not diminished, there appears to be no ground as far as this patient is concerned, for believing that renal glycosuria is a preliminary stage of diabetes mellitus.

Whether diabetes mellitus is due wholly to a deficiency of the internal secretion of the pancreas, it is certain that, as Harris² puts it, harmless anomaly, because, (A) the collected data does not, and could not, reveal a differentiation between renal (so-called) and true diabetes, and, (B) that to assume that the renal type is inconsequential, it would be necessary to assume that the higher mortality of insured glycosurics was solely due to the inclusion of real diabetics in the group. While this probably was the case in a measure, from a study of the data it is apparently quite evident that even were it possible to

EQUITABLE LIFE

GLUCOSE CHART URINE -- BLOOD

Back of the Glucose Chart

have excluded the real diabetic, a high mortality would have still been experienced even though such added mortality were admitted to have been due to overweight, a very noticeable feature in the group, and one often associated with renal diabetes

4 That from the study of a smaller but more recent collection of data where the selection is based on other factors than qualitative urinalysis, such as accurate quantitative urinalysis after test meals, and blood sugar determinations it is apparently clear that (A) Groups of cases have been insured whose mortality was in excess of the

expected mortality (B) Groups of cases have been insured whose mortality was less than the (C) Groups of cases have been deexpected clined insurance who were entitled to it for intelligent study with the view of prognosis in cases of glycosuria, not only must the urine be carefully studied after known test meals, both qualitatively for glucose, acetone and diacetic acid, but quantitatively for glucose (to the exclusion of other sugars) and that comprehensive blood sugar determinations be made both fasting and one, two and three hours after the administration of 100 gms of glucose, or the ingestion of test meals known to contain at least a representative load of carbohydrate

5 That in cases of renal diabetes before an entirely favorable prognosis is given, sufficient consideration be given to the cause of altered metabolic manifestation as evidenced by (A) more or less constant glycosuria, (B) eccentricities of "threshold," (C) excessive dietary regime, (D) overweight, if any or all of these features prevail

TULAREMIA AND REPORT OF A CASE

By JEROME A MURPHY, MD, BUFFALO, NY

ASE-R B, age 35 years, occupation Steward of a Club His duties required him to dress meats and prepare meals I was called to attend him on Dec 6, 1927 He was suffer-

ing from abdominal pains, spasmodic in character, pains in the back and muscles of his arms, vomiting, diarrhea, bloody stools and prostration The abdomen was generally tenHe found 27 cases of this type of glycosuria who had been observed from one to twenty-five years without any other sign of diabetes having manifested itself, although the majority of them have ceased restricting their diet. By repeated examination of the same patient, he has demonstrated that year by year the same abnormally high rise in blood sugar to about 200 mgs occurred after the administration of 50 grams of glucose. In one patient he found that the blood sugar rose in 1916 to 205, in 1920 to 205 and in 1921 to 215 per cent. The patient showed, therefore, a constant harmless cyclic glycosuria."

As Wright¹⁸ has clearly expressed it, "Since the kidney can raise a threshold or barrier to the excretion of sugar and since this threshold can vary in height, it is self-evident that the examination of the urine is not a satisfactory measure of the blood sugar Glycosuria may occur without hyperglycemia, while hyperglycemia need not be followed by glycosuria The point of interest in cases of disturbed carbohydrate metabolism has, therefore, shifted from the urine to the blood A fasting hyperglycemia is indicative of potential diabetes" Surely the criterion has shifted from the urine to the blood in the diagnosis of dia-Hence, as it seems probable and we have stated elsewhere, life insurance companies in insuring certain glycosurics have obtained an excessive mortality in this class, because they have failed to differentiate between the so-called "renal" type and true diabetes. It is all the more incumbent in the light of recent studies to exclude the true diabetic by studying the blood chemistry

Whether we do this by the glucose tolerance test, or by a modified test such as suggested by Brill or by substituting a meal instead of 100 grams of glucose, and doing a blood sugar determination before, and several after the ingestion of the same, it seems to us not to matter a great deal

Our practice is to take a fasting blood sugar—at least five (5) hours fast—and a urinalysis. We then give the applicant a meal rich in carbohydrates, but not confined to carbohydrates, under the supervision of an attendant who certifies as to the quantity and amount of the same. We then do a blood sugar determination and make another analysis of the urine one hour from the beginning of the meal and the same procedure repeated one-half hour after this last determination, thus confining our observations to three blood sugars and the time involved to, say, two or two and one-quarter hours

While this may not be as standard a load as the administration of 100 grams of glucose, we believe it sufficient. Moreover, we cannot exercise the same degree of study in an applicant for life insurance as we can with a patient in private practice. We record accurately the above findings on a chart of which the following is an il-

lustration in respect to the incidence and amount of urine and blood sugar and we think that as time goes on, our statistics will be increasingly instructive

Front of the Glucose Chart

At the present time our practice is based in the estimation of mortality values—on the assumption of a double criterion, urinary and blood sugar. In consequence a balance for these mortality values for each without reliance exclusively upon either one or the other.

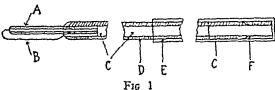

VI Conclusions

I The methods of selection in life assurance in known cases of glycosuria was, until the discovery of insulin, and the subsequent greater direction of attention to blood chemistry, based upon the study of the urine and the general physical condition of the subject. For the most part these applicants were deemed ineligible.

2 The collection of considerable data by life companies has, however, enabled us to definitely determine that certain groups of applicants with glycosuria, on sub-standard plans, have demonstrated a distinctly increased mortality, and that the greater the quantity of urinary sugar, the higher the mortality

3 That from available insurance statistics we have no data which show that renal diabetes is a

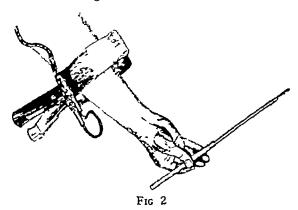

treatment of forty patients suffering with chronic endocervicitis Some of these women came under my observation in the out-patient department of the New York Post-Graduate Hospital, and the remainder in my office have used the instrument in all cases of chronic endocervicitis presenting themselves during the past three months, and am convinced by my experience that the mucous lining of the cervical canal and its glands can be thereby cored out completely and quickly, without pain or discomfort to the patient. There has been a prompt subsidence of symptoms, elimination of the inflammatory process, and a normal appearance of the cervix within about four weeks after the application In only one patient was there more bleeding than a slight staining on the first day, and even this was not at all profuse In this case, however, the moderate bleeding continued for seven days, and was then controlled by the application of 40 per cent silver nitrate All patients have been able to leave the clinic or my office and resume their occupations immediately after the treatment, and not one has complained of subsequent pain or menstrual disturbance

 D Insulated rubber tube.
- E. Metal sleeve.
- F Metal connection between inner metal tube and outside metal sleeve.

The instrument itself (Fig 1) consists of a metal tube 10 or 12 inches long, and 1/8 inch A silicon tube, 1½ inches in in diameter length, is attached to the proximal end, and a fine metallic wire or tube is fitted into the lumen of the silicon tube. A thin tungsten or platinum-iridium wire is attached to the metal tube just beyond its connection with the silicon tube, and parallels the silicon tube throughout its entire length, at a distance of 1/8 inch from it After passing about 1/8 inch beyond the proximal end of the silicon tube, the wire is turned back and embedded in the tip of this same tube. The metal tube is covered with an insulating sheath of hard rubber, extending from the base of the silicon tube The distal half of the insulated tube is covered with a metal sleeve, which has a metallic connection with the inner tube member By holding the instrument at this point, the current is conveyed to the applicator through the operator's hand (Fig 2) The operator thus has perfect

freedom of motion and the necessary manipulations are not interfered with by the weight of a connecting wire. Without deviating from

the basic principals, different applicators (Fig 3) with wires of various shapes have been constructed to facilitate the removal of tissue from angles, corners, etc

The instrument is operated from a high frequency machine, in which there is incorporated a special unit for generating an electrical high wave frequency with unusual power for cutting its way through tissues. This apparatus was originally known as the radio-knife and, in connection with Dr. Maximilian Stern's prostatic resector, as the resectotherm.

TECHNIC

- 1 The patient is placed in the lithotomy position, with the legs well separated and draped in the usual manner
- 2 An illuminated vaginal speculum is inserted to expose the cervix.
- 3 The vagina and cervix are freed of all discharge by swabbing with hydrogen peroxide, and wiped dry (Rid the cervical canal particularly of all discharge)

der and distended There was no sign of rigidity His temperature was 1015, pulse 90 and respirations 20 He was taken ill two days previous with chills, headache and general malaise Further examination revealed a small area of inflammation over the distal phalangeal joint of the mid-finger of his right hand. This he attributed to a scratch received while dressing rabbits a week previous when his finger rubbed against a sharp rib bone. This area was dressed and bandaged.

The abdominal symptoms subsided after three days and his temperature dropped to 99 Pulse was 70 and respirations 18 He began to complain of intense pain in his right arm especially marked in the axilla, elbow and upper arm Palpation in the axilla and about the elbow and muscles of the upper arm revealed tenderness without a marked swelling There was at this time a faint red line extending on the anterior and outer surface of the forearm from the wrist to the elbow region The muscles of the forearm, upper arm and in the pectoral region were extremely sensitive to pressure The area previously noted on his right mid finger showed signs of suppuration was opened, a small drop of pus exuding

The pain in his arm persisted despite local and general palliative measures and on Dec 13 he was removed to the hospital From Dec 14 to Dec 21st, 1927, he was given small increasing doses of Streptoccoccic Immunigun serum subcutaneously. The pain and tenderness in his axillary region subsided but there appeared a marked swelling in the region of the epitrochlear node. This area showed signs of fluctuation and the overlying skin was reddened. On Dec 24th, it was incised and about half ounce of sero-purulent fluid exuded. Iodoform gauze drain was inserted into the incision and he was allowed to leave the hospital. For a week thereafter he was practically free from pain.

On the 2nd of January, 1928, the incised gland still draining a sero purulent fluid intermixed with small particles of a caseous debris, he complained again of pain in his right axilla and neck Examination of the axilla showed a marked fullness, induration and extreme tenderness to touch The upper arm was tender to pressure His temperature, pulse and respiration were found to be normal and aside from pain in his arm no other symptoms were noted The area involved on the finger had healed

One week later a mass about the size of a small orange was felt in the axilla with the arm in hyperextension. This was indurated and tender. He complained of pain in the subpectoral region and lateral cervical region The incised epitrochlear node by now was practically healed, drainage ceasing His temperature, pulse and respirations were normal After 10 days the mass in his axilla began to show signs of suppuration and on January 30th was incised under general anesthesia and about 2 oz of a thin sero-purulent fluid, amber in color together with small masses of a caseous The temperature, pulse and debris drained respiratory reports while in the hospital and subsequently showed nothing of interest or abnormality His leucocyte count ranged from 8,000 to 11,500 The blood Wasserman was persistently negative At no time was there evidence of liver or spleen enlargements (A sample of blood serum sent to the U S Public Health Laboratories, at Washington, D C, on January 24, 1928, was reported as agglutinating Bacterium Tularense in all dilutions from 1 10 ta 1 1280)

At the present time he is up and about free from pain. The incision in his avilla is still draining. He has lost twenty pounds in weight during his illness.

A NEW INSTRUMENT FOR EXCISION OF THE DISEASED ENDO-CERVIX WITH SURGICAL DIATHERMY*

(Preliminary Report)

By MORTIMER N HYAMS, MD, NEW YORK, N Y

From the service of Dr Walter T Dannreuther Department of Gynecology, New York Post Graduate Medical School and Hospital

INNUMERABLE methods of treatment have been advocated for the cure of chronic endocervicitis, varying from all kinds of local applications to amputation of the cervix. The aim of each has been the destruction or eradication of the diseased cervical mucous membrane and glandular struc-

tures, with simultaneous preservation of the musculature. To attain this ideal, the following requisites are desirable (1) a procedure easily carried out by the clinician, (2) painless technic, (3) minimum destruction of uninvolved tissue, and (4) no sacrifice of occupational time on the part of the patient

The instrument I have devised and submit for your consideration has been used in the

REFINED TECHNIQUE OF SPINAL ANÆSTHESIA IN ABDOMINAL SURGERY* By JACOB SARNOFF, MD, BROOKLYN, NY

PINAL anæsthesia for abdominal surgery has in the past few years become more popular than ever before. In fact it is beginning to replace general anæsthesia to such an extent in some hospitals that the official anæsthetist such as nurses, are beginning to worry as to what is to become of their profession as general anæsthetists.

Every organ in the abdominal cavity from the diaphragm above, to the pelvic floor below, can be dealt with with the greatest ease, comfort and safety both to the patient and surgeon mainly due to the drugs now used for spinal anæsthesia, namely novocaine and ephedrine (fig Novocame and its various preparations such as neocame appear to be less toxic and quite as effective as compared to cocaine formerly used Ephedrine which is now used in combination with the spinal anæsthesia in order to maintain the normal blood pressure has done away with a great deal of the fear of shock and falling of blood pressure which previously resulted from spinal anæsthesia. The physiological effects of ephedrine closely resemble adrenalin with the added advantage that its effects are more prolonged It causes a rise in blood pressure lasting a few hours or more

The technique of the introduction of the needle for spinal anæsthesia is the same as for the ordinary lumbar puncture (fig 2), with the exception that in addition one has to inject the anæsthetic fluid into the spinal canal

As we all know, the difficulties encountered during the introduction of the needle for spinal puncture are

First The pain produced by the puncture at times causes the patient to move suddenly and stiffen his back, which brings the spinous processes closer together and makes the introduction of the needle more difficult

Second The most popular method of introducing the needle is in the midline between the spinous processes. Very often, although we aim at the center between these processes in the midline, the needle slides off at an angle to either side of the supraspinous ligament causing the needle to take a course in the wrong direction. The needle may thus strike the lamina to either side or strike the spinous processes without entering the spinal canal (fig. 2)

Third To overcome the pain of the puncture, it has been a practice to inject a small amount of novocaine subcutaneously over the site of the injection by a fine hypodermic needle. This injection obliterates still more the landmarks be-

tween the spinous processes and thus makes the lumbar puncture more speculative

The writer has developed a simple technique whereby the above disadvantages are readily overcome. The main feature is to cause a depression or dimpling by means of one finger (digital pressure) between the selected spinous processes through which space the needle is to be introduced. This technique is as follows.

The site of the spinal puncture is prepared in an aseptic manner as for ordinary operation, namely, the skin is cleansed with benzine, alcohol and ether, then painted with tincture of iodine A rectangular area extending fromabout the tenth dorsal to the last lumbar vertebra and about two inches to either side of the midline is thus prepared. The patient is placed in the sitting position with the knees flexed, forearms folded over the abdomen and the head made to bend as far forward to the knees as possible This position produces a marked curving or arching of the spine with a convexity backwards which in turn increases the interspinous spaces to an appreciable degree The site of the injection is then decided upon depending upon the nature of the operation. If for amputations or permeal work, the third or fourth lumbar interspace is selected (fig 2), if for hernias or pelvic surgery, the second lumbar interspace and if for upper abdominal surgery such as gall bladder or stomach, the first lumbar interspace is selected (fig 3) † To produce the dimpling above mentioned, the tip of the index finger of the right hand is placed over the interspace where the injection is to be made. Pressure is firmly applied by means of this finger aided by the transmitted pressure exerted from the other hand which steadies the index finger and produces more pres-As a result of this maneuver, a dimpling which in appearance represents the circumference of the tip of the finger is produced between the spinous processes which can readily be seen and felt (fig 3)

Now, what has been accomplished? The pressure thus produced causes a pressure anæsthesia which has a double advantage over the anæsthesia produced from the hypodermic injection of novocaine, in that

(1) The landmark is not obliterated, but on the other hand is made more distinct so that one sees readily where to introduce the needle

(2) The depression serves the same purpose in the guidance of the needle as a notch does in the guidance of a saw It prevents the needle from sliding in the wrong direction

^{*}Read before the New Utrecht Medical Society March 26 1928 Brooklyn.

[†] In looking at fig 3 one gets an optical illusion be lieving that the needle is really higher than the list lumbar interspace. This is due to the fact that the head and nectogether with the upper part of the thorax are bent so far for ward that only a portion of the thoraxie spine is visible while all of the lumbar region is in full view. One must also have this in mind when doing a lumbar puncture.

- 4 A small crystal of cocain is placed in the cervical canal and allowed to dissolve
- 5 An inactive, wet, metal electrode (size about 6 x 6 inches) is placed on the abdomen, and held firmly in place by means of a strap or sand bag, the patient may also be directed to make firm compression with both hands, which serves to distract her attention
- 6 This electrode is connected to the high frequency machine by means of a conducting wire
- 7 The operator seats himself comfortably before the patient
- 8 A spring-jawed applicator is placed on the right arm or wrist of the operator, having previously wet the skin with water, and connection is made with the other pole of the high frequency machine by means of a second conducting wire
- 9 The extent of the cervical canal is determined, the size of its lumen calibrated, and the appropriate instrument selected
- 10 The current is turned on and each selective switch set at notch No 2 This will usually provide sufficient current for the operation
- 11 The instrument itself is held firmly in the right hand, with the fingers completely encircling the metal sleeve
- 12 The left hand is used to steady the instrument and may be placed on either the insulated portion or on the metal sleeve
- 13 The tip of the instrument is placed about 1/8 inch from the external os, and the foot switch closed by means of foot pressure. A burning or searing of the tissue occurs
- 14 The silicon portion of the instrument is immediately passed into the cervical canal up to the internal os, and with a rotary motion the entire mucous membrane is cored out
- 15 The foot pressure should keep the foot switch closed until one complete circle with the instrument has been made Release the foot switch, thus disconnecting the current, then withdraw the instrument
- 16 The mucous membrane with its contained cervical glands will be found adhering to the tungsten wire and the silicon tube. A few drops of blood may appear. The entire operation should not take more than a few seconds

- 17 An applicator saturated with 2 per cent mercurochrome solution is now placed in the cervical canal and left in situ for several minutes
- 18 The vagina is wiped dry and the patient allowed to leave the table

AFTER TREATMENT

No vaginal douches are advised or required About the fourth day, a grayish slough will be found filling the cervical canal, and can easily be removed with dressing forceps. An application of mercurochrome, lasting 5 minutes, is made to the canal. On the seventh day, the cervical canal will be found considerably smaller in size and granulation tissue can be seen. About the fourteenth day, the cervix will have reached its normal size with only one or two small unhealed areas visible. An application of 10 per cent silver nitrate is made to these spots. After about three or four weeks, the cervix appears normal and completely healed

ADVANTAGES

The method is well adapted to ambulatory patients and office practice

The patient does not suffer from discomfort or pain

The application requires less than one minute

The technique can be carried out by the average clinician

The mucous membrane and glandular structures of the cervical canal are completely removed

There is no danger of subsequent bleeding The after treatment is simple

No menstrual disturbances follow this method of treatment

The cervix need not be drawn down to the vaginal introitus by traction, thus avoiding the possibility of consequent retrodisplacement of the uterus

The cutting proceeds smoothly and is accompanied by heat, thereby assuring asepsis

Tissue may be removed to any desired depth There is no contraindication to repeated use of the instrument

The method can be used for removing tissue for microscopic examination, when dilatation and trauma are madvisable

(3) Peristalsis of the alimentary canal becomes more marked and can readily be seen and felt. This is explained by the fact that spinal anæsthesia paralyzes the spinal nerves with their rami communicantes which go to make up the sympathetic chain of ganglions supplying the digestive tract, such as the splanchnic nerves, etc. Spinal anæsthesia, however, has no effect on either vagus nerve. What is the result? The sympathetic

Fig. 2. Bony Landmarks Relative to Spinal Anæsthesia Observe the 7 cervical, 12 thoracic, and 5 lumbar vertebra, sacrum and coccyx. Note that lamina and spines of the thoracic vertebra are almost vertical and closely overlap each other like the shingles on a roof. In the lumbar vertebra, however, the lamina and spinous processes are in a horizontal direction and do not overlap, leaving quite a space between them for the introduction of the needle. Note the direction which the needle takes during the lumbar puncture as illustrated by the introduction of the syringe, also by the spinal needles as seen in the close-up of the inserts.

nerves normally act as inhibitory nerves which regulate and hold in check too active peristalsis. The vagus nerve on the other hand is a stimulating nerve which acts to increase peristalsis. Therefore, when the sympathetics are paralyzed, the vagus reigns supreme with resulting increased peristalsis. This phenomenon is utilized to ad-

vantage in cases of intestinal paresis or paralytic ileus. In such cases, immediately after spinal anæsthesia, sudden expulsion of gas and fecal matter with a relief of abdominal distention often results.

The writer has also observed under spinal anæsthesia, marked contractions of the musculature of the uterus during his performance of myomectomy for intramural and submucous fibroids, suspension of the uterus, etc. One therefore need not fear the lack of uterine contractions because of spinal anæsthesia. Such contractions may at times prove of vital importance in checking uterine bleeding as in cases of accidental perforation of the uterus and intestines following currettage. On several occasions the writer has been called upon to treat such condition with favorable results.

A word of warning The writer had occasion, during spinal anæsthesia while exploring the abdominal cavity to feel such marked intestinal peristalsis and contractions of the musculature of the stomach especially near the pylorus that it almost resembled a new growth or indurated ulcer. This, however, only lasted a few seconds and closer observation revealed the fact that it was but a muscular contraction and nothing else. One must bear this in mind during the exploratory stage of the procedure.

In doing gastro-intestinal surgery such as gastro-enterostomies, entero-enterostomies, gastric resections, etc., one must bear in mind and allow for the increased peristalsis which may result from the spuial anæsthesia These marked contractions may temporarily shorten the length of the stomach or intestine included between the traction sutures or clamps used as landmarks in determining the size of the incision and stoma at the point of anastomosis The writer had such an experience in doing a gastro-enterostomy He applied two Allis clamps on the antimesenteric border of the jejunum about three inches apart He also applied two similar clamps at the same distance on the posterior wall of the stomach As he was about ready to start the anastomosis, he was surprised to find that the distance between the clamps on the jejunum was only about one inch while that of the stomach remained three This was due to the marked peristalsis above described which only lasted a few seconds When this occurs one must and then passed off disregard the momentary contraction and gage the length of the incision and lumen at the point of anastomosis in the interval, that is, during the period of relaxation or one may counteract such contraction by a slight pull on the intestine in opposite directions

There is a great deal of discussion in the literature as to whether the gall bladder empties because of its muscular contraction or because of some other factors such as intra-abdominal pressure produced by respiratory movements, etc. No one as yet has observed the actual contractions or

The needle is then passed through the center of this dimpling (fig 3) It thus easily passes first, through the skin, subcutaneous tissue, supraspinous ligament, interspinous ligament and then through the ligamentum subflavum (figs 2 and 4) This consumes about one or two inches of the length of the needle depending upon the size of the individual. The needle is then passed through the dura and as the dura is perforated, after a little practice, one can feel transmitted through the hand and can even hear the snap which resembles the snap of a needle as it passes through ordinary paper. That snap indicates that the dura has been perforated and the spinal canal.

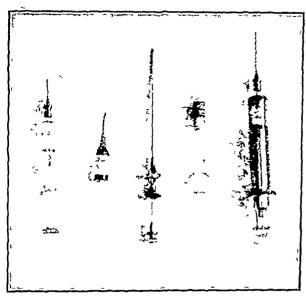

Fig. 1 Spinal Anæsthesia Outfit

(a) 5 cc. Luer syringe, (b) 12 cg neocaine crystals in vial, (c) Lumbar puncture needle with stylet, (d) 1 cc. ampule of ephedrine sulphate, (e) Hypodermic syringe.

entered and any further introduction of the needle is discontinued. The stylet is then removed and one immediately gets a flow of spinal fluid which should be perfectly clear. This spinal fluid is collected in the glass vial to be described.

The writer has used for the past few years to the exclusion of other drugs a crystalline preparation of neocaine which comes in sterile glass ampules (fig 1) in two sizes, one 10 cg and the other 12 cg per dose, approximately one and three-quarter grains The smaller dose is used for individuals weighing about one hundred and The larger dose is used for intwenty pounds This sterile vial with dividuals weighing more neocaine crystals in it holds about two to three cc. The neck of the vial is filed off and made ready for use before the puncture is started so as to avoid unnecessary delay The clear spinal fluid is allowed to flow into the vial until it is almost The stylet is then introduced into the needle to prevent any further escape of the spinal fluid while the crystals are being dissolved One now

has in the vial about two to three cc. of clear spinal fluid with neocaine crystals tals are dissolved with the aid of an ordinary glass syringe holding about five cc to which is attached a good sized hypodermic needle. The fluid is slowly drawn up into the syringe and expelled a few times until one has a clear solution. The fluid is then drawn up into the syringe, the air is expelled from the syringe, the hypodermic needle is removed The stylet is then removed from the puncture needle and the neocame solution is injected slowly into the spinal canal The lumbar puncture needle is then removed, the site of the puncture is massaged and a sterile dressing applied, while the iodine is washed off from the surrounding area with alcohol

While the patient is still in the upright position, I cc ampule containing three-quarters of a grain of ephedrine sulphate in solution, is injected subcutaneously, to counteract any fall in the blood pressure which formerly would occur when ephe-The field of operation is drine was not used then prepared in the usual manner which generally consists of cleansing the abdomen with benzine, alcohol and ether followed by tincture of The laporatomy sheets are then applied This usually consumes from three to five minutes which is about the time necessary for the anæsthetic to begin to act In some patients, however, it may be ten minutes before the anæsthesia is The patient is encouraged to be talkative so as to continue active respiration and is engaged by the surgeon or nurse in pleasant con-This has a beneficial, psychological effect on the patient. He is asked to raise his legs and he generally states that they are numb To which the and he is unable to raise them surgeon replies that this is an assurance that the anæsthetic is properly working and all is well, thereby giving the patient an air of confidence The patient is told that he may feel the pressure of the various manipulations but no pain of any

The writer would like to emphasize some of the facts of spinal anæsthesia relative to the field of operation

- (1) It takes from five to ten minutes for the anæsthetic to act Because of pain, therefore, one should not hasten to employ additional anæsthesia before the lapse of ten minutes. The perfect relaxation of the abdominal muscles enables the surgeon to work with greater ease and dexterity even through a small incision. It is of particular value in cases of suppuration such as gangrenous appendicities, localized abscess, general peritonitis, etc., where the least amount of handling and disturbance of the surrounding structures is most essential.
- (2) A negative pressure is created in the abdominal cavity which prevents the straining and expulsion of abdominal contents such as intestines, stomach, etc., during the operation

piration of about one or one and a quarter hours the anæsthesia began to wear off and had to be

supplemented by a general anæsthetic

(5) The number of failures five In these cases the anæsthetic did not work at all or was In two of these cases, it may not satisfactory be attributed to the fact that the patients were obese, both weighing about two hundred pounds, and the average dose given to them was not sufficient for full anæsthesia. In one case it was felt that the needle was not in the subarachnoid space when the anæsthetic fluid was injected, although there was a clear flow of the spinal fluid when The needle apparthe needle was introduced ently moved out a little during the manipulation while the syringe was being adapted to the lum-bar puncture needle The fluid did not flow in smoothly and met with some resistance which apparently was due to the fact that the point of the needle was outside of the spinal canal one case, the patient was so determined on having a general anæsthetic and continued to rebel that it was necessary to resort to general anæsthesia. In one case, no reason could be found for the failure It may have been due to faulty

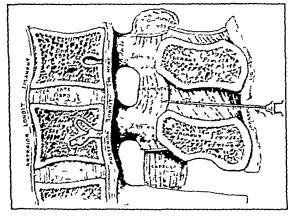

Fig 4 Sagittal section of spinal column with lumbar puncture needle in situ.

The needle passes through skin subcutaneous tissues, supraspinous and interspinous ligament, then through ligamentum subflavum and dura.

technique, to an anamolous condition of the spinal canal, to too low a puncture or an escape of the spinal fluid from the dural puncture. Most of these failures occurred at the beginning of the series, and hardly any towards the latter part. This may be accounted for by the improvements in the procedure, such as

(a) The painless introduction of the needle at the proper level (interspace), introducing the needle at a higher level than formerly, using the first lumbar or twelfth thoracic interspace for upper abdominal surgery

(b) Giving a proportionately larger dose to individuals weighing over one hundred and fifty

pounds

- (c) Waiting ten minutes for complete anæsthesia before resorting to general anæsthesia
- (6) The complications and undesirable after effects

Fatal Shock—None There was no case of death which could be attributed to spinal anæsthesia in this series

Vomiting—Five of the cases vomited during the anæsthesia. About ten more had a sensation of nausea and a desire to vomit but were restrained by being directed to breathe deeply

Headache—Ten cases complained of headache In a few it was rather severe while in others it was mild. The pain was mostly in the back of the head and lasted from a few hours to a few days, after which it cleared up

Me ungismus — Two cases complained of stiffness of the neck with some rigidity of the spine

for a few days

Cord Traima—None One patient, however, complained of pain in the left heel for a few days which was apparently due to slight trauma of some of the nerve filaments going to the lower extremities

Occular Disturbances—In one case, the patient complained of seeing double. This diplopia began three days after the operation and lasted for about three weeks, after which time it cleared up entirely.

Urmary Retention —15 cases Even under general anæsthesia there is quite a percentage of cases where urmary retention occurs post-operatively, especially in hernias and pelvic operations. There is, therefore, very little difference in this respect between spinal anæsthesia as compared to general anæsthesia.

(7) Types of operations in which spinal anæsthesia was used. The writer has treated a variety of conditions by various operative procedures under spinal anæsthesia. Among those included are the following.

Cholecy stectomy
Choledocostomy
Gastro-enterostomy
Gastrectomy
Colectomy
Herniaplasty
Appendectomy
Prostatectomy
Ruptured gastric ulcer
Ruptured duodenal ulcer
Intestinal resection
Hysterectomy
Salpingectomy
Oophorectomy

Ventral Fixation or Suspension of Uterus Exploratory Laporatomy

In many instances there was more than one operation performed at the same time, such as

Cholecy stectomy with appendectomy Appendectomy with hernial repair

peristalsis of the gall bladder in the human during any of the operative procedures in which the gall bladder was exposed If such contractions do take place, they ought to be exaggerated under spinal anæsthesia for the same reasons as outlined above The writer had this in mind during a good many of the spinal anæsthesias but as yet was unable to observe any such contractions of the gall bladder These contractions, therefore, if they do occur must necessarily be of a very mild nature and at infrequent intervals Further observations along such lines by various surgeons may aid in settling this interesting and debatable question of gall bladder physiology, The appendix, however, has been observed by the writer to contract and squirm in a worm-like During these contractions, the appendix feels harder and firmer as compared to its consistency under general anæsthesia should have this in mind in interpreting its pathology during exploratory laporatomy under spinal anæsthesia

(4) The abdominal closure is made much Because of the relaxed abdominal muscles, very little difficulty is experienced in approximating the various layers of the abdominal wall without tension or tearing of even the fine structures such as the peritoneum However, one must bear in mind this marked relaxation with the resulting flabby consistency of these muscles so as not to constrict them by too tight suturing Under general anæsthesia the muscles are as a rule quite tense and it requires a strong pull on the suture in order to approximate them properly On the other hand, under spinal anæsthesia, the muscles become so lax, soft and flabby, almost jelly-like, that very little tension is required on the sutures to approximate the muscle edges, be they the conjoined tendon in a hernia operation, the internal oblique and transversalis in a Mc-Burney incision for appendicitis or the recti muscles in gall bladder or gastro-intestinal surgery Likewise the abdominal organs readily yield to The surgithe necessary surgical manipulations cal technique under spinal anæsthesia thus becomes more refined, enabling the surgeon to work with greater gentleness and precision

On completion of the operation, the patient as a rule feels grateful and marvels at the advent of such perfection which helps to popularize spinal anæsthesia as well as the surgeon

The following summary is founded on the author's recent experience with one hundred laporatomies in the United Israel-Zion Hospital, Brooklyn

(1) The painless introduction of the needle In none of the cases was there any pain of any consequence in the introduction of the needle except in about two cases where the point of the needle was dull and in one case where it was bent On several occasions the patient was asked which of the needles hurt, the lumbar puncture needle or the hypodermic needle for the injection of ephe-

drine and in most cases they stated that the hypodermic needle pained while the other could hardly be felt at all

- (2) The time from the introduction of the anæsthetic fluid to the beginning of complete anæsthesia. It ranged from five to ten minutes. In about eighty per cent of the cases the anæsthesia was complete by the time the patient was draped for the operation which was about five minutes. In the remainder of the cases, the anæsthesia was not complete until about ten minutes after the introduction of the anæsthetic fluid.
- (3) The duration of the anæsthesia The average duration of the anæsthesia was about one hour In 94 per cent of the cases the operation was completed within ten minutes to forty-five minutes from the biginning of the anæsthesia and in all of these cases, the anæsthesia lasted during the entire operation. In the remainder of the cases in which the operation lasted over one hour, the patient began to complain of some pain and

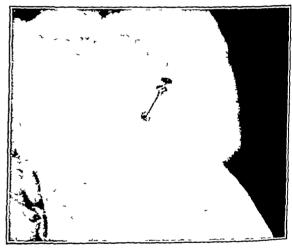

Fig 3 Position of patient for spinal puncture with needle passed through depression (dimple) Arms folded, head, trunk, thighs and neck flexed, producing a marked convexity of the back and an increase in the interspaces between the lumbar vertebra. Note the dimple produced by digital pressure through which the needle is introduced at the first lumbar interspace. The needle appears higher, however, because of the marked flexion of the trunk which only allows a portion of the thoract spine to be visible while all of the lumbar region is in full view.

the spinal anæsthesia had to be supplemented by general anæsthesia of either gas-oxygen or ether

(4) The number of cases which had to be supplemented by general anæsthesia because of lengthy operations—six. Among these cases were three resections of the colon, one gastrectomy, a case of removal of common duct stones with separation of post-operative adhesions and repair of ventral herma and a case of cystic lymphangioma of mesentery, all of which required from one and a quarter to one and a half hours to complete the operation. In these cases, at the ex-

ferable to diminished thyroid secretion, is due to the relatively short duration of the symptoms before treatment was started. In cases where the hypothyroidism was present for a long period of time, lassitude with the inability to stand cold, heaviness of the limbs, and loss of coordination of finer movements, are rather pronounced. Thyroid extract has proven more satisfactory in these cases than iodine. From the point of view of the patient it is essential for both prognosis and treatment that a careful inclabolic determination be made before starting treatment in adolescent or colloid goiter

Conclusions—1 Diminished thyroid secretion was encountered more frequently in the adolescent goiter than in the colloid type—2. The cases presenting a diminished secretion require larger doses of medication and respond slower to treatment.

PARALARYNGEAL ABSCESS—REPORT OF TWO CASES* By JOSEPH W MILLER, MD, NEW YORK, N Y

B, a tall, pock-marked Austrian, forty-nine years of age, was referred to our clinic on May 7, 1927, from the regular service by Dr J C Scal for consultation

About two weeks prior to the above date, patient began to experience pain on swallowing This became progressively worse as time went on and at the time of our examination swallowing was well-nigh impossible. The last few days patient became febrile and even speaking was very painful. His neck was held stiff and rotated to the right and the slightest movement to the left brought about agonizing pain.

Physical Examination—The patient looks acutely ill, febrile, head turned to the right and held rigidly in that position. The normal contour of the neck anteriorly, is changed, the anterior protuberance of the thyroid cartilages (Adam's Apple) is far to the right of the median line. This makes the surface area on the left side from the thyroid notch to the side of the neck much wider and the angle more obtuse.

Indirect Laryngoscopy—Reveals a distorted and elongated epiglottis, the left side of the larynx is compressed, changing the contour of the larynx interior and the entire larynx as a whole is transposed to the right. The left arythenoid is dislocated above its right neighbor and pushed medianwards. The entire larynx, root of tongue and right pyriform sinus is covered with thick stringy mucous which the patient is vainly trying to expectorate. The left pyriform space is entirely obliterated by a red inflammatory mass which compressed and displaced the larynx to the right.

An exploratory puncture was attempted with a curved laryngeal syringe and needle but nothing was obtained. We then decided to do a direct laryngoscopy and puncture. With a Jackson laryngoscope we exposed the larynx and the inflammatory tumor and a long laryngeal knife was plunged into the mass. A gush of pus escaped under pressure welling up rapidly from the depth of the mass. A laryngeal forceps was then introduced into the cavity and dilated and the entire cavity thoroughly emptied by suction.

Relief was instantaneous. The patient swallowed water freely and with little discomfort. The laryny gradually assumed its normal outline and position and after two more visits the patient was discharged cured.

This case is here reported not because of its rarity but because of the lively discussion we had in the clinic when the patient first appeared for examination. Some of us thought it was an abscess, others believed it to be a malignant tumor and still others held it to be torticolles.

Of course, the acuteness of onset, the short duration of the affliction, the febrile condition and the marked tenderness on pressure would easily rule out a malignant tumor Torticolles was ruled out by the physical findings Compression and displacement of larynx by a red, tender, inflammatory mass

Case 2—M B, male, 61 years of age, was referred to us by Dr Minkoff on August 20, 1927 His complaint was inability to turn and move his head from side to side, difficulty in swallowing, a choking sensation and pain in the left ear. These symptoms began gradually five days prior to the above date with increasing severity as time went on and on the date of our first examination he could hardly swallow a drink of water and this not without agonizing pain which radiated to the left ear.

There was no history of injury from swallowing a foreign body as the patient does not remember having swallowed a fish bone or any other foreign substance. Breathing and talking were not interfered with

Examination —Reveals teeth in very bad condition—pyorrhea alveolaris. The tongue is thickly coated. Thick stringly mucous bridges the palate with other parts of the fauces and an elongated indurated mass very tender to touch and markedly bulging runs along the entire length of the left postero-lateral wall of the pharynx. This tender massive column stands out in great relief and can be followed up into the rhinopharynx to the fossa of Rosenmuller on that side and downwards into the left pyriform sinus.

As this swollen column moved en masse toward the median line, when the patient was gagging, to

Choledocostomy with hernial repair and separation of adhesions, etc

(8) Spinal versus general anæsthesia. Under general anæsthesia, the patient is entrusted into the hands of two who are equally liable, the surgeon and anæsthetist. He is turbulently submerged into the depths of unconsciousness only to be aroused later, as in the pre-Volstead days, with all the unpleasant effects of "the morning after the night before". Under spinal anæsthesia, however, the surgeon himself painlessly introduces the safe and reliable agent, novocaine, into the spinal canal thus blocking the transmission of pain along the spinal nerves and lulling the patient into a state of security, ease and comfort during the entire operative procedure

Impressed, therefore, with the more frequent and varied complications and unpleasantness which follow general anæsthesia such as choking sensations, struggling, straining, coughing, vomiting, evisceration, aspiration pneumonia, accidental injuries during the period of unconsciousness, as compared to the ease, safety and comfort to the

patient and surgeon which generally accompanies spinal anæsthesia, the surgeon surely must realize the advantages of mastering, adopting and favoring spinal anæsthesia in most cases of abdominal surgery

In conclusion, the writer would like to emphasize the following

- (1) The pressure produced by the finger (pressure anæsthesia as described) greatly aids in the accurate and painless introduction of the needle and should be practised both in spinal anæsthesia and lumbar punctures in general.
- (2) Spinal anæsthesia produces a marked relaxation of the abdominal muscles which facilitates the operative procedures. It also causes an increased peristalsis which tends to lessen abdominal distension.
- (3) Since the additional use of ephedrine following the injection of novocaine, the unpleasant effects resulting from the fall of blood pressure have almost entirely disappeared, making spinal anæsthesia safer and more satisfactory

"THE FREQUENCY OF HYPOTHYROIDISM IN ADOLESCENT AND COLLOID GOITER"*

By J WILLIAM HINTON, MD, FA.CS, NEW YORK, N Y

N reviewing the cases of adolescent and colloid goiter admitted to this clinic in the past two years, which have totaled one hundred and forty cases, hypothyroidism has been quite a constant finding. This series revealed ninety colloid goiters, and fifty adolescent goiters. All cases up to sixteen years of age are grouped with the adolescent type of goiter, and those above sixteen are grouped with the colloid goiters.

Adolescent Goster -In this series any metabolic reading below zero represents a diminished secretion, and anything above zero, an increased secretion We are aware this is contrary to the accepted variations of a minus ten to a plus ten being within normal limits, but as the chances of an error in a minus reading are much less than in a plus, we have taken the minus reading to indicate a definite decreased thyroid secretion The chinical course of the cases have borne this On this basis we found that sixty-four per cent of the cases gave a minus reading, while thirty-six per cent resulted in a plus reading. The lowest reading was a minus eighteen, which occurred in a girl fourteen years of age who had noticed the enlargement of her neck only four to five months previous to her examination There was no alteration of the menstrual cycle or The average minus readthe vasomotor system ing was a seven The highest plus reading was a nine, while the average was a three and eighttenths These patients averaged fourteen and one-half years of age, and had noticed the enlargement of the neck for one year. The patients with a minus metabolic rate had no symptoms referable to hypothyroidism, and their only complaint was a slight enlargement of the neck.

Treatment—The cases with a plus reading were put on one-half a grain of thyroid extract, T I D Occasionally this dose had to be increased to one grain and sometimes one and one-half grains, T I D Cases included in the minus group were started on one grain of thyroid extract, T I D, and occasionally it was necessary to increase the dosage to one and one half grains,

and even two grains, T I D

Colloid Goiter - This group included ninety cases, forty-seven per cent showing a minus metabolic rate, as compared with fifty-three per cent The lowest minus with a plus metabolic rate This occurred in a girl rate was a twenty-one sixteen and one-half years of age who had noticed the enlargement of her neck for but a few She had no symptoms of lassitude, menstrual suppression, or sensitiveness to cold The average minus reading was a seven highest plus reading was a ten, while the average The enlargement of the neck was a plus four in the average case had been noticed sixteen months before seeking medical treatment

Treatment—The same principle was used in the treatment of this series of cases as in the adolescent type—From our observation the reason that these cases have not had complaints re-

^{*} From the Goster Clinic of Dr Charles Gordon Hevd's service at the New York Post Graduate Medical School and Hospital.

called mentally defective ' This seems to, indicate that neurotic and otherwise tainted conditions are more closely related to epilepsy than to reeblemindedness Buchanan more recently shows from statistics gathered in the Mayo Clinic that the migrainious individual is more apt to beget an epileptic child than is the epileptic individual himself Unless one goes about segregating as well patients with migraine or hindering the procreation of neurotic and tainted individuals in general there is no consistency from the standpoint of inheritance in evoking segregation for the persons actually subject to convulsive states

In 1918 a study was made by Ryther and Ordway on the "Economic Efficience of Epileptic Patients carried out on 100 patients under treatment in the out-patient department of the Massachusetts General Hospital showed that the length of work service depended more upon the freedom from attacks than upon the efficiency of the patient or the character of the occupation that there is a large number of patients in the community of sufficient economic efficiency to earn a living if placed in suitable positions and relieved of the fear of loss of a 10b They consider that the continual anxiety over the fear of losing their job is a greater factor on the apparent deterioration than has been supposed and all the patients give a history of feeling better when at work. This study justified an experiment in the treatment of epileptics such as has been developed for the handicapped patients of other varieties—the blind etc Selected cases would be given work in small work shops especially run for the purpose A recommendation such as this, if wisely carried out would facilitate a swing away from segregated institutional care

Another important consideration lies in the fact that epilepsy can now be given better treatment than formerly This is due to phenolbarbital (luminal) Luminal has definitely proven its value as a sedative drug capable in doses of from 1/4 of a grain to one grain two or three times a day of alleviating epileptic conditions without evil effects over prolonged It is also due to the increase of physicians trained to apply the newer knowledge and to the increase in special clinics. There is more knowledge regarding the social and psychological control of these patients and one need not agree with Clark's psychoanalytic interpretation of the origin of epileptic seizures to be in considerable agreement with him regarding the benefit to the patient from intimate guidance and even a degree of ana-Actually, in practice, one doctors the attacks but treats the patient—as a neu-This kind of medical care can be carried out quite as well on patients living under

home conditions and visiting the physician at regular intervals either in his office or in a neurological clinic as on patients kept under institutional conditions

In all patients with epilepsy fall into four groups judged in a social economic sense. I am speaking only of patients with so-called

idiopathic epilepsy

First there are the patients whose illness while possibly severe are yet capable of control by regime sedatives, etc administered from a clinic or doctor's office, who are able to maintain themselves at some job and who through this circumstance can be expected to show a good kind of mental adjustment. This first group is free from feeble-minded and psychotic complications and equally important not subject to mental fugues in which epileptic equivalents are dangerous—more threatening than an orthodox attack.

Secondly, there is a second group similar to the first in freedom from fugues from psychosis, etc but below the former in their ability to maintain themselves in any work. This latter deficiency may be due to the greater frequency of attacks or to some character defect in the individual. In either case however, the members of this class are always possible subjects for transformation into the former or superior class. This would be applied by the skillful use of the new drugs and by the application of better neuropsychiatric meth-It is true that many patients of this group however remain at the lower level and are incapable of the improvement putting them in the group ahead. But factors already discussed are making possible the transformation of a greater percent of such patients and leaving a smaller number economically unfit If employment centers for the handicapped were developed even a majority of these would be cared for without resorting to institution-It would leave relatively fewer for segregation than was contemplated in the writings of the men who first worked on this subject forty years ago

A third group has in it the patients in whom epileptic equivalents are dangerous particularly from a legal standpoint. These patients are grouped on a basis of the presence of the epileptic equivalents without regard to their economic self-sufficiency though presumably they would in most instances be no better than group two in any wage-earning respect. This is a group for which segregation may be necessary except in so far as even the atypical epileptic manifestations are open to drug and medical control.

A fourth group would be made up of the epileptic patients in whom the epilepts is combined with feeblemindedness. In this group one could expect also to find many patients

meet its uninvolved neighbor of the opposite side and as the posterior pillars on either side were curtained in front of these columns, it became apparent that the swollen column on the left side of the pharynx was an involvement of the left salpingo-pharyngeus muscle

Incision into the mass showed it to be an ab-

scess cavity yielding foul pus in great quantities and extending almost from the origin to the insertion of the salpingo-pharyngeus muscle. The cavity was then emptied by suction and drainage instituted. The patient made an uneventful recovery and was discharged on the sixth day following the operation.

THE PRESENT DAY SOCIAL CARE OF EPILEPTIC PATIENTS

By THOMAS K DAVIS, MD, NEW YORK, N Y

THERE is a certain interest in going back forty years in the American literature and finding what was then written regarding epilepsy I refer to the ideas new at the time regarding institutional care of epi-The most conspicuous exleptic patients ample of the work was the colony in Germany at Bielefeld started in 1867, although France with a smaller but similar colony antedated Bielefeld by twenty years Peterson wrote on the subject of the colonization of epileptics and concerning the Bielefeld Epileptic Colony in the New York Medical Record of April 13, 1887, and through a continued interest in the subject must be credited with having helped in the mauguration of such care in New York However, others in other parts of the country were at work with the result that it was not in the East but in the middle tier of the United States that institutional care was Ohio established in 1893 the first American institution for epileptics, though on the hospital rather than the colony plan Craig Colony in New York State was next (1894) and in its inception and early history Peterson and W P Spratling were the two medical men most concerned

In 1903 Spratling wrote regarding the epileptic, "as the preacher's protege, he causes the ministerial heart strings to tighten, as a client, he provokes his lawyer into having faith in humanity, as a patient, he all but forces his doctor to dislike his calling confidant of no one, in close companionship with only his own perverted imaginings, no wonder in brooding over his fate he sees the world all against him The best we can hope in the reasonable future is amelioration and that will come by segregation in colonies of There he can be suitably clothed and fed, humanely treated, and his energies directed into profitable as well as congenial channels'

We do not doubt that there was good sense in this, with its emphasis on segregation. But the purpose of this brief paper will be to question whether or not it applies as truly now as it did then or whether present-day understand-

*Read at the Annual Meeting of the Medical Society of the State of New York, at Niagara Falls, May 11, 1927

ing of epilepsy tends to minimize the need of institutional segregation

Before undertaking that issue, however, it is interesting to recount with what success the early exponents of segregation worked During the span of twenty-four years there were maugurated twelve state institutions, exclusively for epileptics. This period reaches from 1893 to 1917 at which time the most recent institution, namely, the Iowa State Hospital and Colony for Epileptics, was opened But of the twelve, three have later been altered in character In Connecticut, Illinois and Virginia, institutions originally planned for epileptic patients alone have been absorbed into institutions equally concerned with feeble-minded patients There thus remain nine states in all which at the present time have institutions exclusively devoted to epileptic patients, these states being Indiana, Iowa, Kansas, Michigan, New Jersey, New York, Ohio and Texas In virtually all of these one is able to report that the colony plan is in vogue rather than a strictly hospital regime By these figures, then, the undertaking has not spread far, only now into nine states out of a possible forty-eight One also is struck by the cessation in new projects since Are there reasons why the record of this last decade should not disturb us?

Incidentally, on January 1, 1923, the Federal Census Bureau took a special census of various types of institutions and for the first time obtained data for epilepsy. On that date, there were found to be approximately 8,000 epileptic patients in institutions devoted to them exclusively, 4,000 in institutions caring for both epileptics and feeble-minded, 10,000 in hospitals for mental disease and over a thousand in almhouses, a total of nearly twenty-four thousand

The fact of hereditary transmission of epilepsy has no doubt been a consideration favorable to the idea of segregation. However, one is struck by reports such as the following from Weeks, "that there are more than five times as many epileptics as feeble-minded in those fraternities coming from matings where neither parent can be classed as normal or

of the position of the chin and the direction of the facial line These having been ascertained, the locked instrument is held before the external genitals in the position they should be when ap-The axis of the instrument is at right angles to the facial line. The concavity of the pelvic curve of the forceps is directed toward the side of the leading point. In the construction of the Kielland forceps the lock of the instrument is on the same side as the pelvic concavity and so can be remembered as "the lock faces the point of direction" and in this presentation as the "lock facing the chin" Following Kielland's rule that the anterior blade is applied first, the upper blade is then taken in the right hand and ready to be introduced

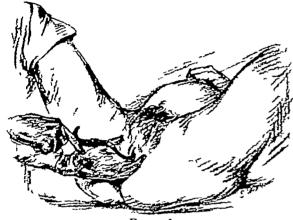

FIGURE 1
Introduction of Anterior Blade (Kielland)

The Application of the Anterior Blade -Under the guidance of the fingers of the left hand in the vagina this blade is introduced between the head and the symphysis with its cephalic concavity facing anterior as is shown in Fig. No. 1 The blade is very gently and carefully pushed upwards into the uterus until the most slender part of its shank rests at the under margin of the symphysis pubes The blade is now in the position shown in Fig No 2, with the cephalic concavity still anterior and the tip of the blade easily palpable under the anterior wall of the uterus In order to get the cephalic curve of the blade in its proper position in relation to the fetal head the blade must now be rotated rotation of the blade is made in the direction of its pelvic concavity. In order to facilitate this, there is constructed on the proper side of the grip a small knob and rotation is made in this direction Extreme gentleness must be exercised in the performance of this. If it is not successful then the blade is either too low or too high and must be adjusted

Generally the introduction and the rotation of the anterior blade is accomplished without any difficulty Complications arising in this manoeuvre should be regarded as warning signals. The head may still be too high or we may be dealing with a pelvic dystocia and a case entirely unsuited to a forceps operation

When the rotations are complete the cephalic curve of the blade falls in position of the fetal head. The blade is in position and remains there of itself and does not need to be steadied by the hand of an assistant. The other blade is then inserted directly posterior, between the head and the sacrum. The instrument is now locked. The blades when locked rest on the perineum after the manner shown in Fig. No. 3. The head is grasped in the bi-parietal diameter. The instrument fits the head snugly. There is no material increase in the diameters to be drawn through the parturient canal. There is also little chance for the head to slip or rotate within the blades.

Having no appreciable pelvic curve the handles of the Kielland forceps are in the same plane as the blades. The direction of the traction is therefore in the direction of the handles, first downwards and backwards. If successful this traction draws the head deeper into the pelvis. A great deal of force is not required as the direction of the force plays the important part. As was mentioned in the mechanism of this presentation, rotation of the chin to anterior takes place very late. This can be accomplished very easily when the proper time comes, or as is recommended by Kielland, traction is continued until one senses the "rotation impulse" and then carries it through. The chin now comes to rest under the symphysis as in Fig. No. 4.

FIGURE 2
Anterior Blade Before Rotation (Kielland),

dles are now carried upwards and so flexion is obtained. Holding the handles in the left hand and supporting the perineum with the right, the head is slowly delivered following the normal mechanism.

In the treatment of "persistent chin posterior" it has been recommended in the past that attempts

needing segregation But is it segregation into colonies for epileptic patients that is needed? It would seem more logical to have the feeblemindedness the basis for segregation in institutions primarily for that condition

A fifth group would be made up of the epileptic patients in whom psychotic symptoms are present It would seem desirable, regardless of the presence of convulsive seizures to have such patients cared for in hospitals for the insane

In brief, one can say that segregation for epileptic patients has become, or with propriety can be made to be, urgent and vital for an increasingly smaller group of such patients

This can be arrived at only if the following efforts and agencies are upheld or extended into areas not yet awake to them

- Emphasis on the neuropsychiatric clinic care of epileptic patients
- The establishment of workshops for the type of patient just short of ordinary methods of self-support
 - The recognition that feeble-minded pa-

tients, regardless of the presence of attacks should, if institutionalized, be cared for in institutions for the feebleminded

A parallel emphasis on the mental hospital care of epileptic patients with psychoses

The economic adjustment of even the controlled patient is precarious if employers continue to count one attack as sufficient cause for discharge It therefore becomes necessarv to add as a tenet the newer education of the business world. At this point we are in conflict with the unfortunate results of labor compensation laws. It is better that at great effort modification and exceptions should be built into them, to the end that a community and industrial adjustment should be in the reach of epileptic patients, than that all such patients should be crowded into institutions

THE TREATMENT OF FACE PRESENTATION BY KIELLAND FORCEPS By S P GOLDBERG, M D, BROOKLYN, N Y

THE recognition of the value of the Kielland forceps as an instrument of rotation is steadily increasing. Constructed in a manner that makes bi-parietal application the rule, it has brought with it a great many new There are a great many positions possibilities and situations in which the use of our accustomed models of instruments has been disappointing or practically impossible One of these is the situation obtaining in the non-rotated and extended position of the fetal head in face presentation

Face presentation is considered pathologic and as a rule is fully developed only after labor has been in active progress for some time. It leads very frequently to a long and protracted labor due to weak labor pains. This is especially true in the first stage. The soft face does not press as hard nor as evenly as the occiput with consequent delayed dilatation of the cervix and early rupture of the bag of waters Therefore, labor is very frequently dry. All these tend to produce maternal exhaustion and fetal danger head of the babe is subjected to great cerebral The mortality, both maternal and compression Face presentation, in itself, fetal, is increased is no indication for intervention but all the above mentioned factors increase the frequency of such measures

The usual mechanism of labor is that descent occurs with the facial line in the transverse di-

The anterior rotation of ameter of the pelvis the chin does not take place until the face is well The next step 18 down on the pelvic floor The chin, mouth, nose, eyes and finally the occiput appear successively over the peri-

Abnormalities of mechanism may occur These are mainly of rotation The first of these is deep arrest in which the face comes deeply into the pelvis even down on the perineum but the facial line remains in the transverse diameter other form is that in which the chin remains at the sacro-iliac joint or even rotates into the hol-When this occurs we have low of the sacrum the so-called "persistent-chin posterior" latter becomes a most formidable problem Labor usually comes to a standstill Only very rarely do these cases terminate spontaneously

Given a strict indication for intervention, forceps is the method of choice With our previous instruments, first manual rotation and the secondary application of the blades was advised in order to make the procedure less dangerous to the child In the use of the Kielland instrument this is not necessary

Technique of Application -It must be remembered that in face presentation the chin is the point of direction or denominator and plays the same rôle for this presentation that the occiput does in vertex labor A careful vaginal examination is made to obtain an accurate diagnosis

of the position of the chin and the direction of These having been ascertained, the facial line the locked instrument is held before the external genitals in the position they should be when applied The axis of the instrument is at right angles to the facial line. The concavity of the pelvic curve of the forceps is directed toward the side of the leading point. In the construction of the Kielland forceps the lock of the instrument is on the same side as the pelvic concavity and so can be remembered as "the lock faces the point of direction" and in this presentation as the "lock facing the chin" Following Kielland's rule that the anterior blade is applied first, the upper blade is then taken in the right hand and ready to be introduced

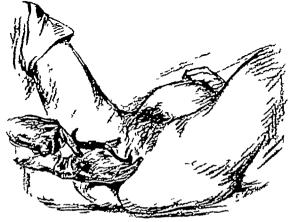

FIGURE 1

In order to facilitate this, there is constructed on the proper side of the grip a small knob and rotation is made in this direction. Extreme gentleness must be exercised in the performance of this If it is not successful then the blade is either too low or too high and must be adjusted

Generally the introduction and the rotation of the anterior blade is accomplished without any difficulty Complications arising in this manoeuvre should be regarded as warning signals. The

head may still be too high or we may be dealing with a pelvic dystocia and a case entirely unsuited to a forceps operation

When the rotations are complete the cephalic curve of the blade falls in position of the fetal head The blade is in position and remains there of itself and does not need to be steadied by the hand of an assistant. The other blade is then inserted directly posterior, between the head and the sacrum The instrument is now locked The blades when locked rest on the permeum after the manner shown in Fig No 3 The head is grasped in the bi-parietal diameter strument fits the head snugly There is no material increase in the diameters to be drawn through the parturient canal There is also little chance for the head to slip or rotate within the blades

Having no appreciable pelvic curve the handles of the Kielland forceps are in the same plane as the blades The direction of the traction is therefore in the direction of the handles, first downwards and backwards. If successful this traction draws the head deeper into the pelvis great deal of force is not required as the direction of the force plays the important part was mentioned in the mechanism of this presentation, rotation of the chin to anterior takes This can be accomplished very place very late easily when the proper time comes, or as is recommended by Kielland, traction is continued until one senses the "rotation impulse" and then carries it through. The chin now comes to rest under the symphysis as in Fig No 4 The han-

Figure 2
Anterior Blade Before Rotation (Kielland),

dles are now carried upwards and so flexion is obtained. Holding the handles in the left hand and supporting the perineum with the right, the head is slowly delivered following the normal mechanism.

In the treatment of "persistent chin posterior" it has been recommended in the past that attempts

be made to convert this position to an occiput anterior or to rotate the chin anterior, manually inder deep anesthesia. These failing, craniotomy is advised. Forceps have been regarded as a dangerous and destructive instrument and proved mefficient. The Kielland has removed some of the formidability from this situation. One cannot but warn, however, that it is a very difficult procedure and should be attempted only after experience with the instrument has been gained

The application is made with one blade to the maternal left side, the other to the maternal right side as in normal pelvic application. The lock

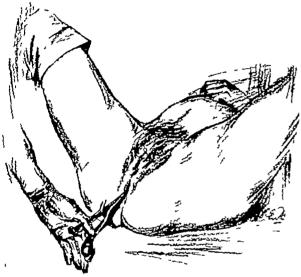

FIGURE 3
Both Blades in Position (Kielland)

of the instrument is directed posteriorly in the direction of the chin, the instrument is consequently bottom side up. Very careful traction and rotation through 180 degrees must be accomplished. The head is then delivered as before Deep episiotomy should always be the rule in this manoeuvre.

The Kielland forceps find their greatest field of usefulness in the high forceps operations. The two main factors entering into the problem in these procedures are traction in the proper direction and rotation. Constructed along lines to cope with both of these factors as well as giving at all times the ideal of applications, an accurate cephalic one, the instrument cannot but lead to success. In fact, they give astonishing results in cases that have been deemed unsuitable for forceps operations. Among these is the problem of face presentation, the topic of this article

Used as a high rotation instrument some morbidity must be expected. The vaginal lacerations are no more serious nor of any greater frequency than in other forceps operations. There is no injury that can be called typical of Kielland forceps origin. The accidents reported in the literature arising in the application of the anterior blade are probably explicable in terms of other things rather than a fault of the instrument. The greater majority of these are probably due to the operator.

These failures on the part of the operator may be along the following lines Errors in the judgment of indications, faulty diagnosis of position, or lastly, failures in technique The use of the

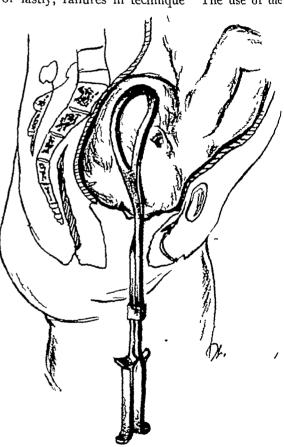

FIGURE 4
Forceps in Position Chin Rotated Anterior

Kielland forceps requires, above all, an accurate diagnosis of position. This entails both an external and internal examination of great care. With experience along the above mentioned lines the Kielland forceps will give only the most gratifying results.

PRESIDENTIAL GREETINGS

A year of service as President-elect has revealed the multitude and variety of the activities of the Medical Society of the State of New York The last five years have seen a great broadening of the field of the Society, especially in the assumption of leadership in all civic duties in which health is involved. The President must now deal with governmental officials and civic organizations as well as physicians, and must make the

discharge of his society duties the predominant object of his daily work. He anticipates a year of happy service because of the example of his predecessors, who, after a term of strenuous activity, continue in the service of the Society in minor positions in order to perfect the work which they and their colleagues began while in office.

HARRY R. TRICK

THE PRESIDENT'S ANNUAL ADDRESS

The principles of the practice of public health and preventive medicine by family doctors, which were only timidly suggested ten or even five years ago, are now boldly proclaimed as standards which county societies and practicing physicians are to follow if they would retain their place of respect and honor before the public These principles were discussed by Doctor Sadher in his annual address on May 22, at the annual meeting of the Medical Society of the State of New York (See page 631) Scattered through that address are concise statements which collectively form a creed or ideal under which physicians are acting with increasing interest and vigor as the methods of putting them into practice are The following paragraphs contain some of these statements slightly changed in some instances in order to make them clear in the absence of their context

"To what extent are we utilizing medical knowledge to make it productive in the prevention of disease, the lessening of human suffering and the prolongation of life? Herein lies the duty of the medical profession of today,—to give the people the results to be obtained from the progress which has accrued from scientific inves-

"We do not give sufficient importance to the early symptoms indicating a possible change from health to disease. Physiology fades into pathology slowly and somewhat insidiously but not without evidences of the changes even though slight in character. To the physician they should suggest a possible change from normal to abnormal function, from physiology to possible pathology, and should lead to an investigation of the particular organ or organs suspected and not be deferred until, by reason of a large group of symptoms it becomes relatively easy to determine the diagnosis, but frequently too late for cure to be obtained

"It is for the physician of the present and future to conduct his activities so as to bring preventive medicine to that increasingly high standard as an art that curative medicine now enjoys

"Every physician must concede the vital need of lay organizations in public health work. Medical men unaided cannot do full justice to the art of medicine without having at their command assistance from outside agencies But the physician is basically trained to be the leader in such health work, and in those communities where the physicians exercise a gentle and friendly leadership over lay organizations and directing the health activities of their community we find a more advanced public health condition and better progress in preventive medicine. We are fortunate in having several such counties in this state, and they indicate a blazed trail of progress which wisdom would prompt us to follow

The limitation of communicable diseases repre-

sents only a modest portion of what can be accomplished in the prevention of disease, providing each physician cooperates with the health department and also insistently produces and teaches the prevention of disease is that large field where the Department of Health does not, and should not, enter

"There should be a very close alliance between the Department of Health and the County Medical Society. In no other way is it possible to push on to its fullest extent this new phase of the physician's work. In no disease is this better demontrated than in tuberculosis where our work, to be successful, requires the active cooperation to a maximum extent of physicians, departments of health, and lay organizations

"Every physician should recognize his personal responsibility in seeing to it that diphtheria immunization receives his whole hearted support and intensive work. For the medical men to depend on health officials to carry on this work is shirking a real responsibility and detracting from the prestige of the family physician who above all others should aim to guard and protect his clientele from a disease which is soon to become a public disgrace to any community

"Periodic Health Examination is sure to become a standard procedure, and in no other way will we be able to properly anticipate some diseases, or be enabled to diagnose and care for them during the early and curable stages chapter in the life history of a physician's work is so pathetic as that which deals with the patient who has passed into the incurable stage before applying for relief Health examinations are going to forestall much of this needless waste of life The public is beginning to demand this service and is seeking means to have it applied We, the medical men of this country, must see to it that this newer phase in the art of medicine is developed into a great instrument for a recognition or prevention of disease

"Maternal Mortality is one of the greatest unsolved problems with which we are confronted In this state one mother at the present time out of every hundred and seventy-one will lose her life as a result of what has usually been considered a physiological process This figure has remained relatively the same for the past twelve years, constituting one out of every nine deaths in women of the age group 15-44 years and was only exceeded by the death rate from tubercu-This great and seemingly unwarranted loss of life can be lessened only by painstaking prenatal care, intelligent, skilful and well considered delivery, followed by detailed post partum care to an extent not always practiced We must recognize our responsibility in seeing that childbirth is rendered safer for the mothers of the future and that this stigma of a high maternal mortality is removed from our state

EDUCATION AND PROPAGANDA

Movements in medicine and public health follow a natural order of development

- 1 Knowledge
- 2 Reasoning
- 3 Action

Knowledge is primarily impersonal and concerns forces, methods, and means of health con-Scientific knowledge of disease and health is something apart from the people, like the knowledge of the stars and moon,-interesting facts but of little use in their application to daily life. When knowledge is applied in sickness, it becomes personal, and some one asks, "of what use is that knowledge to me"? He takes a personal interest in it and desires to know more about He reasons about it and discusses it with his friends and neighbors Finally, knowledge and interest develop into action, and the instructed persons seek their doctors or vote for public health measures

Every movement in medicine and public health starts with knowledge, is subjected to the tests and improvements of reasoning and finally The physician expects that evolves into action knowledge will always be followed by action He is highly trained in scientific knowledge, and when he is called to a case, he demands that the sick person apply that knowledge His directions and instructions are even called orders The doctor is likely to be impatient with the people when they do not adopt his advice. He is likely to avoid giving that advice unless the people seek it

The incentives that usually lead the sick to seek and follow medical advice are pain and disability If these incentives are absent, others equally potent must be adopted in their place. The doctor does not do his duty to the community unless he offers his knowledge of the prevention of sickness and death before pain and disability are present But in the absence of pain and disability the people lack the incentive to seek and follow his advice

The practice of preventive medicine requires that the doctor shall have a knowledge of preventable conditions, and a strong desire for their application based on intelligent reasoning Knowledge and reason are far inferior to pain and disability in their immediate potency to lead people to adopt health methods. Yet the magnitude of the task of educating and inspiring the people in public health is a challenge to the medical profession which physicians are planning to meet through their county societies Physicians are meeting their obligations in preventive medicine to such an extent that programs of medical society meetings commonly include discussions of public health topics which are co-ordinate with the consideration of scientific subjects

The task of educating the people along medical lines would be hopeless if it had been done entirely by physicians, but fortunately the medical profession has the aid of the departments of health, the public schools, and lay organizations to such an extent that health education is invoked as justifying organized sports and the promotion of artificial beauty and comeliness. The problem in public health education today is its control rather than its promotion Physicians must direct it or it will be perverted to selfish uses

The essential element in public health and popular health education is publicity, especially Physicians formerly through the newspapers avoided publicity, and even made their codes of ethics demand its suppression, because it was used by quacks for their personal gain. The physicians now recognize two kinds of publicity 1, that of the individual doctors, and 2, that of the scientific movements which the doctors represent

The code of ethics and the sentiment of physicians both forbid the exploitation of a doctor and publicity regarding the cures which he has done or the people whom he has treated Some medical societies even forbid their members to sign their names to educational articles, but require the writers to sign the name of the Society However, newspapers insist that an educational article shall be signed by its writer as representing his medical organization The medical society is a collection of individual doctors one of whom writes and speaks for all the others. It is the individual doctors rather than the organizations that speak or write

Lay organizations engaged in public health work are not subject to the strict code of ethics of the medical profession, but they depend on wide publicity for their very existence must show results in order to hold the support of the people who patronize them and the money givers who support them They must transmute information of their activities into emotion and action on the part of their followers. They live by means of publicity of their aims and actions

When the question of selfishness enters into the publicity of any movement, there also enters the temptation to indulge in advertising and propaganda and to present only those arguments which are favorable to the proponent of a cause On the other hand, physicians believe in stating both sides of a question after the judicial manner of a judge on a bench rather than that of a par tisan lawyer for only one side

The interpretation of the ethics of publicity is a prolific source of disagreement between lay organizations and physicians Ethics enter into such impersonal matters as statistics, especially those compiled after the manner of "before and after" a good movement was maugurated Physicians wish to know, for example, whether or not a fall in the tuberculosis rate by a county following the introduction of a new public health organization could not be duplicated by another county having no such organization

Ethics also enter such commonplace matters as news items Physicians believe that publicity should include the activities of not merely one group, but of all organizations engaged in a particular line of public health work

Discussions and misunderstandings between physicians and lay organizations have developed

largely because physicians were willing to stand aloof from publicity or advice regarding publicity on the mistaken ground that it was unethical to publish their activities. However, the present attitude of physicians is that they shall dominate the field of medical publicity just as they do that of scientific medicine, and that their ethical standards shall prevail in public health publicity as they do in the practice of scientific medicine.

FACILITIES FOR THE ANNUAL MEETING

Why do members of the Medical Society of the State of New York attend its Annual Meeting?

Some attend for a single purpose,—to read or hear a scientific paper, or to attend a committee meeting, or to see the scientific exhibits, and always there are recreational features. The Annual Meeting is a well balanced congeries of many features which few physicians can study in their completeness. The majority of doctors go without a definite purpose, but with the desire to see whatever may be new to them, whether in science, or papers, or books, or entertainment

How can one judge the interest and success of an Annual Meeting? Two elements enter into one's impression

- 1 His leisure, or the time which he has to devote to its several features, and
 - 2 His receptivity, or mental state

A member will say the meeting is successful if he is pleased with two or three lectures or exhibits with which he comes in contact, while a half dozen other features of a meeting have not interested him at all

The trustees and members of the Executive Committee of the State Society will be influenced in their judgment by the financial balance which remains after all bills are paid and the creditors are satisfied

The Editorial Staff of the Journal must report the meeting from all points of view, and will judge its success by the sum total of all its phases

The exhibitors judge the success of the meeting not merely by the direct sales or orders taken, but by the impression which the doctors make upon them. The exhibitors will say, "The doctors are receptive and interested in our exhibits," or, "The doctors do not respond. They are in a hurry, or are worried, or are looking for something they cannot find." The exhibitors are expert in diagnosing the reasons for the attitude of physicians, and the one condition on which they all agree is that the best response of the physicians occurs when all the features of the meeting are held under one roof. If the principal features of the meeting are placed in two buildings, the in-

terest of the doctors becomes reduced to less than fifty per cent of that when the meetings are held in one building

The finances of the Annual Meeting are also to be considered Exhibitors and advertisers pay money for exhibit space, just as they do for advertising in the Journal Doctors do not always think of this except to protest when the annual dues are payable The Journal could not exist even after the Annual Dues of each member were paid, if it were not supported by our advertisers The good will of the exhibitors has a high money value which may amount to many thousands of dollars annually The opinion of exhibitors and advertisers should therefore have great weight with those who plan the Annual Meetings of the Moreover, the same conditions State Society which lead physicians to take an interest in the commercial exhibits also arose their interest in the scientific sections and other features of the meeting

Where are the hotels which can accommodate all the features of the annual meeting? The Waldorf-Astoria, of New York City has demonstrated its suitability on several occasions when the Society has met in it. There are also suitable hotels in Saratoga, Syracuse, Rochester, and Buffalo These five available places are scattered almost uniformly throughout the State, and if they are utilized in rotation the doctors of every section should be satisfied

There is a precedent for holding the State So-The State Deciety Meeting under one roof partment of Health conducts an annual conference of health officers and public health nurses at which the attendance is about the same as that of the Annual Meeting of the State Society It has usually held their meetings in the Grand Union Hotel in Syracuse, which can accommodate all the features of the meeting and also provide the doctors and nurses with room and board State Department of Health has tried the experiment of meeting in a city where the members and the section meetings are scattered, and there has always been a demand for a return to Saratoga with its assemblage under one roof. This is a precedent that the Society of the State of New York may well consider

INDEXING CURRENT MEDICAL NEWS

Officers of the State Medical Society frequently request the editors of this JOURNAL for-information regarding the activities of the Society, and its component branches. This JOURNAL has often printed authorized accounts of the activities of the various committees and has made them the subject of extensive editorial comments. The medical societies of New York State have progressed further than those of any other state in developing new standards of practice and in making the influence of physicians felt in the community to a degree commensurate with their importance.

It is a new idea of great significance that the County Society should assert its active leadership in public health and civic medicine, and that a medical journal should carry extensive reports of public health work from the standpoint of the practicing physician and the family doctor. This Journal can do so because the doctors of New York State are occupying an advanced position in the practice of public health and civic medicine. Yet a record of the

evolution and development of these lines of practice cannot be obtained except by a patient search through the files of the JOURNAL. The Index Medicus and The Cumulative Index of the A M A do not list either editorials or news items. Yet these items are necessary for anyone who wishes to know how the doctors of New York State are practicing public health and civic medicine. The items on such subjects as medical legislation, the public relations committee and the Cattaraugus County Health Department are not listed in any general index of medical journals.

The editors of this JOURNAL have frequently printed items of news in the scientific department in the hope that they will be listed in the general indexes and in the abstractss of other journals

This subject will be discussed in the meeting of the American Medical Library Association in the New York Academy of Medicine next September

LOOKING BACKWARD

THIS IOURNAL TWENTY-FIVE YEARS AGO

Overcrowded Street Cars—Conditions of travel in New York City which now seem commonplace, excited wonder and fear a quarter century ago, when the following editorial was written for this Journal of June, 1903

"It became necessary a few days ago, to call an ambulance and have a passenger from a Third Avenue elevated train in Manhattan removed to a hospital. It was not a case of the sudden exacerbation of a constitutional disease, nor was the person, a young woman, injured by any railway accident, she was totally exhausted by the crowding of her fellow passengers. Others have recently been reported in the papers as having fainted from this cause and the number who are more or less seriously bruised every day must be countless.

"The indecency of such close contact of both sexes, the physical dangers that overcrowding

make imminent and the discomforts which are forced upon every one will not be endured much longer, of that we feel certain. If some ingenious person will offer a practical solution of the vexing question he will hasten the day of emancipation from this factor in metropolitan life for the making of the moral, nervous and physical wrecks."

The quarter century which has elapsed since that editorial was written has seen no amelioration of the unhygienic conditions—but on the contrary they have become more acute and extensive. Yet the rates for death and morbidity have been lowered more than in any previous twenty-five years. Moreover, the place to find an epidemic affecting twenty per cent of the population is not the Metropolitan District, but some small rural community where the people omit personal hygiene in their over-confidence in the efficiency of Nature's protection.

MEDICAL PROGRESS

Infectious Diseases, Where Did They Come From and Where Are They Going?—M A Reasoner, writing in the Military Surgeon, April, 1928, lxii, 4, thinks it is fair to assume that in the early days, when mankind was young, infectious diseases as such did not exist They are a punishment which man has brought upon himself by ignorance, filth, and sin is not difficult to understand how when men lived in caves and close quarters where cleanliness was unknown, some of the free living bacteria became habituated to living on man or for those living in or on domestic animals or vermin to transfer themselves to man or There is a mass of evidence pointing to the instability of bacterial species They may change their shape or manner of growth, they may lose or acquire motility, hemolytic activity, capsule formation, agglutination, and virulence It is therefore plausible that free bacteria transferred to man accepted the changed nourishment and grew with much more vigor, absorbed more freely from their host and, if capable of toxin production, gave off toxins and became disease-producing they adapted themselves to man, those who nourished them developed a resistance or immunity against them and the disease manifestations appeared only when transmitted to others who had not the opportunity to develop such immunity The author traces the progress of sanitation from the time of Moses, who was the institutor of the prophylaxis of disease, to the present development of preventive vaccination and the production of artificial immunity, showing that up to the last few years the tendency has always been to develop a race of immunes against contagious diseases We are now confronted with a new condition of affairs wherein there will be an increasing loss or diminution of both acquired and inherited immunity in those whose resistance is greatest and also a survival of many who have little or no resistance, and therefore we may expect a decreased average resistance to such diseases Due to the increasing population there should be a greater tendency toward the appearance of epidemic diseases and at the same time, due to the influence of preventive medicine and prophylactic inoculations, a diminution of resistance in the individuals

A New Method of Treating Infectious Diseases—S Levy of Koln-Bayenthal states that for 14 years past he has used the following plan of treatment with great success especially

in pulmonary infections. He makes repeated turns of adhesive plaster about the middle of a forearm with the idea of preventing any absorption by the superficial lymphatics which are as good as sealed up for the time The hand and wrist should be livid but the radial pulse must still be palpable. He then obtains the specific products of the disease which contain the offending bacteria and injects them into the volar surface of the forearm intense inflammatory reaction takes place as a result of which antibodies are produced which find their way into the venous system This reaction is limited to the area below the level of the plaster and the author has never seen it extend above the latter, while the cubital and axillary lymphnodes are never swollen nor tender In a case of grippal bronchopneumonia of the lower lobes-to take a disease at random-he injects at once some of the purulent sputum without any attempt at filtration or otherwise lowering its virulence apeutic results are not at all sudden or critical in character, but on the contrary improvement is gradual, several days being required to obtain the desired result Only twice has he seen an abscess develop at the site of injection In tuberculosis he makes use of ordinary tuberculin, going from one arm to the other and increasing the dosage, and claims to have cured cases of consumption which had appeared The method should also prove the hopeless proper one to immunize against various diseases, and in animal experiment the author has caused the formation of antibodies in the blood without any effect on the general health, after injection of dysentery bacilli into the bandaged leg of a dog -Münchener medizmische Wochenschrift, March 23, 1928

Iridotasis for Glaucoma -On the basis of his experience with 100 cases of glaucoma, Jules Dupuy recommends iridotasis for the following reasons (1) Technically it is simple and therefore safe in the hands of the less experienced operator (2) It seems to give more permanent beneficial results in a greater number of cases than any other operation for glaucoma (3) There is an absence or rarity of the late infections seen after tre-The success of the operation depends upon the deliberate incarceration of the iris, which has hitherto been considered a The method breach in operative technique consists in anesthetizing the eye with instillations of 4 per cent cocaine, and using adrenaline copiously between instillations One or two

drops of a 1 per cent solution of atropine is instilled about five minutes before starting the The incarceration is preferably operation made above, though not necessarily A triangular flap of conjunctiva with its base toward the limbus is dissected away anterior chamber is entered by means of a sharp keratome, care being taken to make as small an incision as possible, so that the iris will not slip back into the anterior chamber The iris is grasped with a very small forceps and drawn through the corneal opening, using great caution, since in many cases the iris is easily torn The herniated portion of the iris is gently stroked with a spatula toward the edges of the wound, thus forming a wedge of the iris tissue. The conjunctival flap is sutured in place with three or more catgut sutures Atropine is again instilled before the eye is bandaged. The eye is dressed on the second day, atropine being instilled before the bandage is reapplied. In most cases the eye is free of any dressing by the fifth day Atropine is instilled until all inflammatory symptoms have disappeared. With this procedure the tension has been markedly lowered in all cases of absolute glaucoma which it has been possible to follow up, and many cases, after two or three years' observation, appear clinically arrested - Southern Medical Journal, April, 1928, xxi, 4

The Importance of an Early Diagnosis of Chronic Glaucoma — D Leighton Davies is convinced that if chronic glaucoma is taken in hand at an early stage there is every probability that vision can be saved. In patients who have passed through some debilitating illness or nervous strain and whose eyes tire easily, the practitioner should keep the idea of chronic glaucoma before his mind. The following situation is characteristic of glaucoma in persons past middle age. The patient's eyes tire very easily after reading, he procures stronger glasses and finds that he gets on much better, in a few weeks or months he again finds difficulty in reading Some patients state that the sight becomes misty and objects hazy After a longer or shorter period there is definite failure of vision Once the diagnosis is made, the earlier that operation is performed the better will be the result Iridectomy cannot be depended upon, but in the great majority of cases vision can be saved by the Elliot trephine operation In Davies' records of 100 operations by this method the patient's sight has been retained in 91 While the trephine operation cannot restore sight lost, it can prevent further deterioration. In a few cases it may be better to wait, trusting to general hygiene and the wise ordering of the patient's mode of life, together with the use of eserine,

but the large majority will ultimately lose sight unless operation is undertaken—Lancet, April 7, 1928, ccnv, 5458

Observations on the Rheumatic Heart.— Jenner Hoskin, writing in the Practitioner, April, 1928, cxxx, 4, states that acute rheumatism tends to run different courses in adults and in children, in the former arthritic manifestations are a prominent feature and the heart often escapes, while in children the only evidence of active rheumatic infection may be "growing pains,' tonsillitis, or chorea It is therefore highly important that these affections be rocognized and given due attention In all febrile diseases there is some temporary myocarditis and in all cases of mitral reflux of rheumatic origin there is some degree of mitral The prognosis depends on the effect of the valve lesson in causing mefficient circula-The one essential in treatment is rest, all other measures are subsidiary Three to six months in bed, followed by very limited exercise for a further six months, is a fair average for juvenile cases in which there has been no extreme cardiac damage For another twelve months no strenuous exercise should be permitted, and then only if the myocardium has recovered and the valve lesion is of slight When the pericardium is badly affected, the patient should rest flat on the back for many months, for if adhesions tend to occur it is better that they should be on the posterior aspect of the pericardium. Blisters and ice-bags help to relieve pain in the acute stage, but have little effect on the ultimate result Paracentesis should be resorted to only when effusion is causing heart failure. Hoskin administers salicylates, as he believes they diminish serious complications. He does not hesitate to use cardiac tonics, and gives digitalis when heart failure has occurred or is imminent.

The Veins of the Cardionectors — E Geraudel refers to earlier articles on the arterial circulation of the cardionectors and sums these up very briefly Taking up the corresponding veins he states that the ventriculonector is drained by an important vein which empties into the right auricle about 2 mm from the free border of the valve of Thebesius, where the opening is visible to the naked eye vein itself is closely accompanied at first by its artery and may be easily identified in the bundle of His The two perforate the fibrous septum side by side but in separate canals At Tawara's node the vein unites with a larger one which proceeds from the interventricular muscular septum Thus reinforced it traverses the node and then courses between the muscular bundles of the myocardium of the right auricle and left ventricle Finally it leaves its

MEDICAL PROGRESS

Infectious Diseases, Where Did They Come From and Where Are They Going?—M A Reasoner, writing in the Military Surgeon, April, 1928, lxii, 4, thinks it is fair to assume that in the early days, when mankind was young, infectious diseases as such did not exist They are a punishment which man has brought upon himself by ignorance, filth, and sin is not difficult to understand how when men lived in caves and close quarters where cleanliness was unknown, some of the free living bacteria became habituated to living on man or for those living in or on domestic animals or vermin to transfer themselves to man or There is a mass of evidence pointing to the instability of bacterial species. They may change their shape or manner of growth, they may lose or acquire motility, hemolytic activity, capsule formation, agglutination, and virulence It is therefore plausible that free bacteria transferred to man accepted the changed nourishment and grew with much more vigor, absorbed more freely from their host and, if capable of toxin production, gave off toxins and became disease-producing they adapted themselves to man, those who nourished them developed a resistance or immunity against them and the disease manifestations appeared only when transmitted to others who had not the opportunity to develop such immunity The author traces the progress of sanitation from the time of Moses. who was the institutor of the prophylaxis of disease, to the present development of preventive vaccination and the production of artificial immunity, showing that up to the last few years the tendency has always been to develop a race of immunes against contagious diseases We are now confronted with a new condition of affairs wherein there will be an increasing loss or diminution of both acquired and inherited immunity in those whose resistance is greatest and also a survival of many who have little or no resistance, and therefore we may expect a decreased average resistance to such diseases Due to the increasing population there should be a greater tendency toward the appearance of epidemic diseases and at the same time, due to the influence of preventive medicine and prophylactic inoculations, a diminution of resistance in the individuals

A New Method of Treating Infectious Diseases—S Levy of Koln-Bayenthal states that for 14 years past he has used the following plan of treatment with great success especially

in pulmonary infections. He makes repeated turns of adhesive plaster about the middle of a forearm with the idea of preventing any absorption by the superficial lymphatics which are as good as sealed up for the time The hand and wrist should be livid but the radial pulse must still be palpable He then obtains the specific products of the disease which contain the offending bacteria and injects them into the volar surface of the forearm intense inflammatory reaction takes place as a result of which antibodies are produced which find their way into the venous system This reaction is limited to the area below the level of the plaster and the author has never seen it extend above the latter, while the cubital and axillary lymphnodes are never swollen nor tender In a case of grippal bronchopneumonia of the lower lobes-to take a disease at random-he injects at once some of the purulent sputum without any attempt at filtration or otherwise lowering its virulence apeutic results are not at all sudden or critical in character, but on the contrary improvement is gradual, several days being required to obtain the desired result Only twice has he seen an abscess develop at the site of injection In tuberculosis he makes use of ordinary tuber culin, going from one arm to the other and increasing the dosage, and claims to have cured cases of consumption which had appeared The method should also prove the hopeless proper one to immunize against various diseases, and in animal experiment the author has caused the formation of antibodies in the blood without any effect on the general health, after injection of dysentery bacilli into the bandaged leg of a dog —Munchener medizinische Wochenschrift, March 23, 1928

Iridotasis for Glaucoma -On the basis of his experience with 100 cases of glaucoma, Jules Dupuy recommends iridotasis for the following reasons (1) Technically it is simple and therefore safe in the hands of the less experienced operator (2) It seems to give more permanent beneficial results in a greater number of cases than any other operation for glaucoma (3) There is an absence or rarity of the late infections seen after tre-The success of the operation depends upon the deliberate incarceration of the iris, which has hitherto been considered a The method breach in operative technique consists in anesthetizing the eye with instillations of 4 per cent cocaine, and using adrenaline One or two copiously between instillations

sizes the importance of recognizing these conditions and including them in the indications for exploratory laparotomy, since in some instances these unusual lesions are amenable to surgical relief The cases cited show that the following conditions may closely simulate carcinoma (1) Foreign bodies in the stomach, as hair balls, food balls, or shellac balls, (2) chronic granulomata, as Hodgkin's disease, leucemia, or lymphosarcoma, (3) chronic inflammatory lesions, as syphilis, which may be ulcerative or cirrhotic, and primary tuberculosis, which may be ulcerative or fibrous, (4) tumors other than carcinoma or sarcoma, and the benign tumors, as myoma, adenoma, papilloma, hemangioma, and (5) inflammatory tibromatosis Patients having any of these lesions may have palpable tumors of the stomach, or large 1-ray filling defects, or both, accompanied by symptoms which might well be those of carcinoma The conditions enumerated should be carefully excluded before exploratory operation is denied a patient apparently suffering with inoperable carcinoma of the stomach -Annals of Surgery, April, 1928, lxxxvii, 4

Certain Intestinal Poisons — Erwin Becher of Frankfurt-am-Main, speaks of the past and even present uncertainty concerning the nature of intestinal autointoxication. We know something of indol, indican, substances derived from tyrosin, phenol, etc., in this connection, but just how they might contribute to disease has been a puzzle, and we only know that all of these deleterious substances accumulate in the blood of uremic patients. The entire symptom-picture of true uremia strikingly resembles that of chronic phenol intoxication. It is of course true that in renal insufficiency these substances absorbed by the intestine also accumulate in the blood and the author may not mean that an excess of these substances is always responsible for nephritis, but that the accumulation in the blood gives rise to the clinical picture of uremia However, an important step in the mechanism is the entrance of these substances into the cerebrospinal fluid which enables them to act directly on the brain Becher at last arrives at the conclusion that these intestinal substances are the first cause of some forms of renal disease so that the entire mechanism involves a pronounced vicious circle He does not touch on the wherefore of these toxic bodies in the intestine—whether from mechanical constipation, faulty diet, or whatnot-but in his closing paragraph on therapeutics he intimates that since the toxins are almost wholly derived from protein in the diet, this must be cut down. He also believes in intestinal disinfectants, including charcoal The phenols, etc may possibly he directly neutralized by calcium and sodium sulphite. Of the most modern drugs, the author says that insulin and liver extracts suggest possibilities, the former to stimulate the oxidation of carbohy drates and the latter because of the control of pernicious anemia, a disease believed to be due also to intestinal toxicosis—Munchener mediziuische Wochenschrift, March 16, 1928

The Intensive Alkaline Treatment of Gastric and Duodenal Ulcer-The excellent results which he obtained with the intensive alkaline treatment of gastric and duodenal ulcers lead Hugh McLean to adopt this method as a routine in 1924 The results have been gratifying Uncomplicated ulcers clear in the extreme up in a short time, as indicated by the v-rays, and in the great majority of cases all the Often large symptoms disappear quickly penetrating ulcers clear up in a few weeks In the last year not a single case out of over 70 thus treated required operation. It does not matter very much what combination of alkalis is used, but the following powder gives excellent results Sodium bicarbonate, 1/2 ounce, heavy magnesium carbonate, l ounce, calcium carbonate, 1 ounce, bismuth oxycarbonate, 2 The patient should be put on a fluid drams diet, consisting of about three pints of milk daily, approximately 8 ounces every two hours Six or seven small teaspoonful doses of the alkalı are given daily, shortly after the milk, with an extra dose at bedtime In severe cases a smaller dose of the mixture may be given every hour. When the patient no longer suffers pain or discomfort solid food may be added gradually, and the number of doses of the powder may be gradually reduced, but two or three doses should be taken daily for several months Irritating food, smoking, and alcohol should be avoided. There need be no fear of alkalosis as a result of the intensive alkaline treatment In patients suffering from pyloric stenosis an operation can often be avoided by the use of the alkaline treatment. In mild cases the ordinary alkaline medication may suf-In severe cases, with excessive vomiting, there is practically no communication between the stomach and the intestine, and hydrochloric acid is constantly being lost, with a resultant tendency to alkalosis Under these conditions the safest treatment appears to be a powder consisting largely of calcium carbonate with some magnesium carbonate, administered on the plan above outlined In addition small doses of calcium chloride will help the alkalosis -British Medical Journal, April 14, 1928, 1, 3510

artery, which empties into the coronary, while the vein as already stated empties into the This vein is called a vein only by courtesy for it has neither muscular tunic nor The author is less certain about the veins of the atrionectors for there is no venous companion to the powerful artery which traverses the node of Keith and Flack minute veins empty into the internal aspect of the crista terminalis of the sinusal portion of the auricle Doubtless the two systems of nector veins empty into different portions of the auricle as above described Distention of the auricle with back pressure appears to be able to cause tachycardia and it is therefore possible that an arterial ischemia might cause a corresponding bradycardia Again an arterial hyperemia might cause acceleration — Archives des Maladies du Cœur, March, 1928

Angina Pectoris in Children—Contrary to the opinion held by many that angina pectoris is rare in children, E J Stolkind maintains that this affection does occur in early life support of this statement he cites cases from the literature and his own experience pathology and etiology of angina pectoris are the same in children and adults Recent work on angina favors the hypothesis, which the writer has held for many years, that angina pectoris is of a complex character, its main factors being (1) the chemical and toxic substances circulating in the blood. (2) the state of the nervous system, especially the autonomic system, and the disposition of the patient, (3) the condition of the heart and aorta The original "noxious irritation" begins in the heart or aorta, or in both, and is transmitted through the cardiac plexus, and through the sympathetic and vagus reaches the central nervous system The factors involved may vary in intensity and thus produce different results For example, when embolism or thrombosis of the coronary arteries occurs, in one case there will be a typical attack of angina, while in another there will be only signs of heart failure In the treatment of angina pectoris the pathogenesis should be taken into consideration and individual regimen and diet Attention should be ordered in every case given to the toxic substances in the blood and to the nervous system Food should be given in six or seven small meals Injections of morphine, omnopon, etc., with atropine or novatropine are of great use Amyl nitrite often Of the cardiac stimulants Stolbrings relief kind prefers digalen, strophanthin, or caffeine sodio-benzoate In one case injection of saline Never should alcohol relieved the attack be given to children Bleeding is advisable only in cases of dilatation of the left heart with edema of the lungs In prolonged paronysms dry cupping or sinapisms to the chest, warmth to the extremities, and diathermy are sootling. Paravertebral injection of novocaine may be tried after other methods have been un successful—British Journal of Children's Discases, January-March, 1928, xxv, 289-291

The Ten-Year Diabetic - Elliott P Ioslin discusses the subject of the ten-year diabetic under three headings What he is, what he should be, and how to make him so oretically, the ten year diabetic does not exist, because the average duration of life of the dia betic has not yet reached eight years, but practically he is very much alive and presents the chief diabetic problem of today. In 1912 there were 31 of the author's true diabetics who had lived ten years or more, but today there are, living or dead, 1,161, or 22 per cent of the total cases On the basis of these and other statistics presented, Joslin predicts that every diabetic will be a ten-year diabetic, not The average diabetic by and by, but soon whom he sees need not expect death until he is past the age of sixty-one years Coma has practically been abolished as a cause of death, but there has been a steady increase of cardio-Arteriosclerosis, vascular and renal deaths therefore, has replaced coma as a cause of death in diabetes, Morrison was able to demonstrate its presence in 86 per cent of cases of ten years' or more duration As to what the ten-year diabetic should be, he should be of normal weight and the finest product of the His handicap periodic health examination should be offset by prophylactic treatment He should have less arteriosclerosis The reason premature arteriosclerosis is seen in young diabetics is because formerly they were kept alive with a low-carbohydrate and high fat Insulin has brought better days one of Joslin's diabetics takes less than 50 gm of carbohydrate Never overfeed a diabetic and least of all with fat This is the first rule to avoid arteriosclerosis in ten-year diabetics Protein should be limited to a moderate amount, about 1 gm per kilogram body weight, a little less in the old, a little more in the young It is inadvisable to give diabetics more cholesterol than the normal individual lesterol deposits of atheromatosis are premonitions of a later calcification. Apart from eggs the quantity of cholesterol in foods is comparatively low If a diabetic shows signs of arteriosclerosis, he should be restricted to one egg, and other patients should not be given more than two eggs daily -American Journal of the Medical Sciences, April, 1928, clxxxv, 4

Pseudo-Carcinoma of the Stomach —Vernon C David describes some unusual lesions of the stomach resembling carcinoma and empha-

are hereby abrogated" But as has been decided by our Court of Appeals, this constitutional provision "does not compel us to incorporate into our system of jurisprudence principles, which are inapplicable to our circumstances and which are inconsistent with our notions of what a just consideration of those circumstances demands"

The common law then, except as it has been modified by statute, is in force in New York State. In the Federal courts, however, there is no recognition of a common law of the United States as distinguished from that of the individual states. A Federal court, however, having jurisdiction of a case enforces the common law of the state in which it sits and applies common law principles where they are applicable

The study of the common law is as broad as the study of philosophy and history, of human nature itself. Many of its principles were taken over bodily by the authors of our Federal Constitutions and were set down with but little change in the first ten amendments So various are the sources of the common law and so voluminous, that no one mind could grasp them all No single life is long enough in which to permit a person to sit down and read, digest and understand every case that has been decided wherein the principles of the common law have been enunciated the student of the subject, however, vast aid is rendered through digests, text books and especially by the commentaries of the great masters, such, for example, as those of Sir William Blackstone and Chancellor Kent of our own State But it is to the decided cases themselves that one must go in search of the prin-Dreary and dry as dust as this undertaking is ofttimes represented, such in fact is not the case, for within the moldering pages of the law reports in one way or another will be found the sorrows and the joys, the hopes and the fears, the aspirations and the disappointments of our fellow beings in all generations

The cases, says Chancellor Kent, "contain that great body of the commercial law, and of the law of contracts, and of trusts, which governs at this day" The old cases, he continues "are worthy of being studied even by scholars of taste and general literature, as being authentic memorials of the business and manners of the age in which they were composed Law reports are dramatic in their plan and structure. They abound in pathetic incident, and displays of deep feel-They are faithful records of those 'little competitions, factions, and debates of mankind' that fill up the principal drama of human life. and which are engendered by the love of power, the appetite for wealth, the allurements of pleasure, the delusions of self-interest, the melancholy perversion of talent, and the machinations of fraud. They give us the skilful debates at the bar, and the elaborate opinions of the bench, delivered with the authority of oracular wisdom. They become deeply interesting, because they contain true portraits of the talents and learning of the sages of the law. We should have known but very little of the great mind and varied accomplishments of Lord Mansfield, if we had not been possessed of the faithful reports of his decisions.

In the jurisprudence developed and expanded by the courts of New York State, there is much in which we all take pride. Johnson's, Paige's and Barbour's Chancery Reports comprise as elaborate, as scientific and as complete an exposition of principles of equity as can be found in the United States. To the decisions of our Court of Appeals lawyers and judges everywhere turn with respect.

We are in an era of rapid change. New conditions and new circumstances of life are constantly encountered. These require new applications of old rules and principles. Wherever possible the principle of "stare decisis," that is, adherence to the principles previously enunciated, is followed, but not slavishly. For, as Kent tells us, the "records of many of the courts in this country are replete with hasty and crude decisions, and such cases ought to be examined without fear, and revised without reluctance, rather than to have the character of our law impaired, and the beauty and harmony of the system destroyed by the perpetuity of error"

Abiding by the decisions of the past gives certainty and definiteness to the law. Where a decision has been made upon solemn argument and mature consideration, the presumption is in favor of its correctness, and, says Kent, "the commumity have a right to regard it as a just declaration or exposition of the law, and to regulate their actions and contracts by it. It would therefore be extremely inconvenient to the public, if precedents were not duly regarded and implicitly followed It is by the notoriety and stability of such rules that professional men can give safe advice to those who consult them, and people in general can venture with confidence to buy and trust, and to deal with each other If judicial decisions were to be lightly disregarded, we should disturb and unsettle the great landmarks of property"

While this is no doubt true, the fact remains that the most celebrated of English and American judges have not hesitated to blaze new trails or, where they found antiquated or obsolete principles blocking the path of justice, have never feared to discard such rules and to formulate and adopt new ones

It is for this reason that Lord Mansfield be came one of the most celebrated judges of England. He was a bold innovator. The law of England, he declared, "would be an absurd sci-

LEGAL

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

COMMON LAW

The title of this, the fourth of our series of editorials, contains a phrase familiar to everyone and yet we doubt whether outside of the legal profession there is a clear concept of just what the "common law" imports

Like other legal phrases it has been variously defined and used in different senses When lawyers use the words they have in mind the "common law" of England which has been modified and as modified adopted in the various states of the Union Generally speaking, the English common law means the "lex non scripta" or unwritten law as defined by Blackstone, in other words, that portion of the law of England which is based upon immemorial usage and the general consent of the people, as distinguished from legislative enactment "The common law," says Chancellor Kent in his famous Commentaries, "includes those principles, usages, and rules of action applicable to the government and security of person and property, which do not rest for their authority upon any express and positive declaration of the will of the legislature"

It was Sir Matthew Hale who said that the common law of England is "not the product of the wisdom of some one man, or society of men, in any one age, but of the wisdom, counsel, experience, and observation of many ages of wise and observing men"

The common law then, is that great body of principles which is composed of the accumulated decisions of the courts of justice and the treatises and digests of learned men who have been dealing with this subject since the dawn of English history

To attain, therefore, to a complete understanding of the common law it is necessary to embark upon a survey of the philosophy of English and American history in order to understand the surrounding circumstances and the particular conditions and occasions which brought forth the decisions of the courts

The merit of the common law arises from the fact that it represents the accumulated wisdom of the ages. It was not the product of any one brain or of one age, rather it represents a gradual growth. Legislatures come and legislatures go enacting statutes to meet the exigencies of the moment. Some of these are wise and of lasting value, others rapidly grow obsolete and are discarded. No one genera-

tion of lawmakers can foresee the needs of the future, nor can they imagine all of the contingencies which may arise in connection with the regulation of any subject

"Where," says Sir Matthew Hale, "the subject of any law is single, the prudence of one age may go far at one essay to provide a fit law, and yet, even in the wisest provisions of that kind, experience shows us that new and unthought of emergencies often happen, that necessarily require new supplements, abatements, or explanations But the body of laws that concern the common justice applicable to a great kingdom is vast and comprehensive, consists of infinite particulars, and must meet with various emergencies, and therefore requires much time and much experience, as well as much wisdom and prudence, successively to discover defects and inconveniences, and to apply apt supplements and remedies for them, and such are the common laws of England, namely, the productions of much wisdom, time, and experience"

The excellence of the Institutes of the Roman republic was ascribed by Cicero to the gradual and successive improvements of time and experience, and he held that no one mind was equal to the task

The common law of England, either in whole or in part, has been adopted in every state of the Union, except Louisiana In Michigan, Wisconsin, West Virginia, Kentucky and New York it is adopted by virtue of the Constitutions of those states In others the recognition of the common law is made by statute

Our New York Constitution provides that "such parts of the common law, and of the acts of the Legislature of the colony of New York, as together did form the law of the said colony, on the nineteenth day of April, one thousand seven hundred and seventy-five, and the resolutions of the Congress of the said colony, and of the convention of the State of New York, in force on the twentieth day of April, one thousand seven hundred and seventy-seven, which have not since expired, or been repealed or altered * * * shall be and continue the law of this State, subject to such alterations as the Legislature shall make concerning the same But all such parts of the common law, and such of the said acts, or parts thereof, as are repugnant to this Constitution,

NEWS NOTES

THE ANNUAL MEETING

The announcements of the One hundred and twenty-second Annual Meeting of the Medical Society of the State of New York occupied a prominent amount of space in the last three issues of this Journal The meeting was held on the four days beginning Monday, May 21st, at Albany, and was attended by about one thousand physicians The House of Delegates and the evening meetings were held in the Ten Eyck Hotel, while the scientific sessions the scientific exhibits and the commercial exhibits were held in the Armory

The meeting as a whole was satisfactory Committee on Arrangements had attended to the details of the preparations, and its Chairman, Dr.

J N VanderVeer, was constantly on hand seeing that everything and everybody functioned smoothly

The number in attendance was about the same as that of past years, and the same faces were to be seen for many who are active in the Society will be present for thirty years in the service of the organization Dr E Elliott Harris has been active in the Society for more than that time, serving on prominent committees and presiding over the deliberations of the House of Delegates This year his request to be relieved of further active duties was granted, and he was made Speaker Emeritus of the House of Delegates

HOUSE OF DELEGATES

The annual meeting of the Medical Society of the State of New York opened at 230 o'clock on Monday, May 21, 1928, in the Grand Ball Room of the Hotel Ten Eyck, Albany, N Y, with a session of the House of Delegates The House was opened without ceremony by the Speaker, Dr E Ehot Harris of New York, who has been Speaker ever since 1920, when the office was established, but on account of ill health he relinquished the chair to the Vice-Speaker, Dr John A Card, of Poughkeepsie

The first action was the appointment of reference committees to whom the consideration of the printed reports of the officers and committeemen was assigned The principal item of business of the afternoon session was a consideration of the amendments to the constitution and by-laws which had been advised by a special committee of which Dr S J Kopetzky was chairman the revision of the formal rules of the society is often referred to as the favorite pastime of members of medical societies, yet the revisions are necessary in order to keep abreast of the progress which takes place in administrative medicine as well as in scientific practice Medicine is progressing in every line, and in none is the progress more rapid than in methods of medical society activities It must be remembered that the Medical Society of the State of New York is a legal corporation with an annual budget of over \$100,-000, and activities touching civic procedures as well as the medical work of the members It is therefore necessary that every item of business be conducted in a legal way, and yet that formalism and confinement by outworn rules be avoided The Medical Society of the State of New York preserves a remarkable freedom of action by minor revisions of its governing rules in order to adapt them to developing conditions

The revisions adopted this year after a twohour consideration were all of a minor nature, and yet their total will be of great value in carrying on the affairs of the society smoothly and

promptly

The delegates dined together at 6 30 o'clock in the Ten Eyck About one hundred tickets had been sold previous to the dinner, but 140 physicians came and filled the dining room to its capacity Still the excess numbers brought the doctors closely together and promoted good fel-

The evening session was devoted principally to a consideration of the relation of the Cattaraugus County Medical Society to the Milbank Public Health Demonstration which has been conducted in that county during the last five years Dr I P Garen President of the Cattaraugus County Medical Society, introduced a resolution that the House of Delegates endorse the attitude of the Cattaraugus County Medical Society in its controversy with the Milbank Demonstration in Public Health administration This precipitated a debate and an explanation of the point of view of the County Society

Dr W D Johnson of Batavia, called attention to the lack of knowledge of the physicians generally as to what is taking place in Cattaraugus County and said -"I spent two days in Cattaraugus County two years ago, calling on doctors to ascertain their opinions of the Milbank Demonstration and found opposition except from two or three doctors who were receiving pay from the

672 LEGAL

ence, were it founded upon precedents only Precedents were to illustrate principles and to give them a fixed certainty" The certainty of a rule, he thought, was often of more importance, especially in mercantile cases than the reason for it - It is for this reason that Mansfield has been called "the founder of the commercial law of England"

The attitude of judges in this respect depends much upon their training, heredity, environment and natural inclination. How these things enter into and are interwoven in the texture of the law reports has been brilliantly explained by Judge Cardozo of the New York Court of Appeals in his work entitled, "The Nature of the Judicial Process" In Albany today, under his brilliant leadership, we find as bold, as capable and as philosophical a jurist as has graced the bench of any court of the United States since the days of John Marshall In his hands no outworn or unjust principles escape his invigorating touch Old and outworn doctrines are discarded and new principles of justice are applied to new conditions He and his associates of our highest

Court are making great contributions to the jurisprudence of the country Indeed, what was said by Chancellor Kent with respect to the English decisions may be justly applied to the pronouncements of our Court of Appeals The judicial tribunals, says Chancellor Kent in the first volume of his Commentaries, "have been almost uniformly distinguished for their immaculate Every person well acquainted with the contents of the English reports must have been struck with the unbending integrity and lofty morals with which the courts were inspired do not know where we could resort, among all the volumes of human composition, to find more constant, more tranquil, and more sublime manifestations of the intrepidity of conscious rectitude If we were to go back to the iron times of the Tudors, and follow judicial history down from the first page in Dyer to the last page of the last reporter, we should find the higher courts of civil judicature, generally, and with rare exception, presenting the image of the sanctity of a temple, where truth and justice seem to be enthroned, and to be personified in their decrees"

CLAIMED BURN BY BAKING TREATMENT

In this case the plaintiff claimed that the defendant had been engaged to treat her for certain pains in her limbs, and that as a physician he had recommended certain electrical baking treatment to be administered. The plaintiff further charged that the defendant treated the plaintiff by giving her electric baking treatments, but the same was negligently and carelessly done, and by reason of such negligence the plaintiff's feet, ankles and legs were severely burned That when these burns were called to the attention of the defendant he negligently treated the same so that they became worse and the plaintiff was incapacitated for a long period of time and she was required to procure other medical assistance and treatment

In August the plaintiff had consulted her family physician with reference to a condition af-This physician recommended fecting her reet arch supporters for the plaintiff and also referred her to the defendant so as to get the correct type of arch supporter The plaintiff appears to have visited the defendant who, after examination recommended treatment for the arches and stated that her legs should be massaged three times a The plaintiff week for two or three months claimed that after the first visit to the defendant she went to the defendant's office and her legs were put in a machine and prepared for baking by a girl in the defendant's employ That the girl turned on the electric switch and left the

plaintiff in the room alone and unattended The plaintiff claims that immediately her feet felt as though they were burning That she clapped her hands and the nurse came in immediately and The plaintiff returned off the electric switch mained for massage and electric treatment and thereafter put on her shoes and stockings and She claims that when she arrived went home home she found large blisters on her feet That she then called the defendant who advised her to apply lead and opium and also unguentine. A few days later she called on the defendant at his office He at that time examined her feet and applied zinc ointment and her feet and legs were massaged by the defendant's nurse and a little onitment applied to them The defendant physician treated the plaintiff for about a week thereafter

This action came on for trial and resulted in a verdict in favor of the defendant, the plaintiff failing to prove that the result complained of by the plaintiff was due to any negligence or carelessness upon the part of the defendant, or that the defendant had failed to follow the proper and approved practice in his application of the baking treatment or the massage to the plaintiff's legs and feet From the judgment in favor of the defendant the plaintiff appealed to the Appellate Court, which court affirmed the judgment in defendant's favor and the dismissal of the com-

plaint

THE SCIENTIFIC SESSIONS

The reading and discussion of scientific papers constitutes one of the principal features of the meetings of the Medical Society of the State of New York as it does most other medical societies. This year 123 papers were listed on the program which were discussed by 218 speakers

Getting out a balanced program is a monumental work for which the Society is indebted to Dr S J Kopetzky, Chairman of the Scientific Committee, and his colleagues, the Chairmen of the Scientific sections The papers will be published in the Journal throughout the year

JOINT SECTION MEETING

A joint meeting of all the sessions was an innovation that worked out well. This was held on Wednesday evening in the Ball Room of the Ten Eyck, and was attended by over 200 members. The program was planned so as to present the newer movements in which phlysicians were interested. The program was as follows.

"Cost of Medical Care or Hospitalization of the Middle Class Economic Group," by Thomas P. Farmer, Syracuse, Chairman of the Committee on Public Health and Medical Education Dr Farmer reported studies of the cost of medical service in relation to the cost of living, and showed that it had not increased so rapidly as

most other items of expenditures

"The Medical Aspects of Workmen's Compensation," by Dr William Warren Britt, Tonawanda, Chairman of the Committee on Economics Dr Britt showed, among other points, the need of standardizing the laws relating to the medical aspects of Workmen's Compensation, and cited the differences in the laws of the several states regarding the definition of a hand and a foot Some states define the hand as extending to the wrist, and others to the elbow

"Morals of Medicine," by Dr Harry R Trick, Buffalo, incoming President of the Medical Society of the State of New York Dr Trick said that idealism is the most powerful attraction of the medical student. He urged physicians to cultivate the idealism, for any variation from the

highest motives arouses the suspicion of the public. The people generally admire the doctor because he embodies their ideal of service to their fellow men. It is gratifying to physicians that they are able to meet that ideal

"The Present Status of the Practice of Medicine," by Dr Linsly R Williams, Director of the New York Academy of Medicine Dr Williams is in a strategic position to observe the individualistic and selfish side of physicians, as well as their idealism. He touched on several points in which physicians are tempted to observe the customs of competitive business rather than altruism. Among other topics he discussed specialism, excessive fees, charity work in hospitals, the Life Extension Institute, and State Medicine as exemplified by the attitude of a class of doctors who are actuated by motives of selfishness

"The Future of the Practice of Medicine," by Dr Ludwig Kast, of the Committee on Graduate Education of the New York Academy of Medicine Dr Kast outlined a plan by which an interne in a city hospital would go to a rural community and take the practice of a local physician, while the doctor took the interne's place on the

staff of the hospital for a few weeks

The papers were well prepared, and were of general interest to the medical profession. They will be published in early issues of the Journal. The general meeting was a success, and will probably be repeated.

THE HEART EXHIBIT

The scientific exhibit which has been a feature of the Annual Meetings during the past three years was upon the heart this year, but instead of being set up for the last day of the meeting only, it was on view throughout the entire period. It was planned and conducted by a committee consisting of Robert H. Halsey, M.D., Chairman, Joseph H. Bainton, M.D., Secretary, Clarence E. de la Chapelle, M.D., Erastus Corning, M.D., Joseph A. Cox, M.D., Arthur C. DeGraff, M.D., L. Whittington Gorham, M.D.

The pathological specimens of Douglas Symers' collection of Bellevue Hospital were brought to Albany and set up under the supervision of Dr Joseph Bainton

A series of charts were also shown, among which were those which were prepared to illustrate the findings of the special committee for the section on heart disease, of which Dr Halsey was Chairman

The Scientific Program on Thursday consisted of lantern slide demonstrations of heart disease and a series of moving picture studies illustrating heart block, heart valves in action, and the growth of cells artificially cultivated

The heart exhibit and demonstration was eminently successful, and was worthy of far greater study than the average doctor could give to it, but it will enable him to visualize the heart when he reads about the organ Demonstration The opposition was based on specific reasons which were definite and proper Nearly all that had been printed regarding the Demonstration had come from the agents of the Demonstration, and I have found it necessary to instruct practically every new group of Doctors that I meet regarding what has been done in the County"

The President, Dr James E Sadlier, suggested that the Speaker call on Dr W H Ross, one of the Trustees of the Society, who, with Dr Arthur W Booth, a fellow Trustee, had served on a special committee to investigate conditions in the county and bring about a settlement of the differences of opinion between the County Society and the managers of the Demonstration Dr Ross reviewed briefly the lengthy meetings of the representatives and their agreement on eight general principles and seven specific points relating to the Demonstration, all of which were printed on page 495 of the May first issue of this Journal, in the report of the Secretary Ross said that the report of the Secretary brought the information down to the middle of April, and that events since that time could be taken as an indication of the attitude of the men of the Milbank Foundation toward the agreements said that three significant events had occurred since the middle of April

1 The Secretary of the State Charities Aid Association, the operating agent of the Milbank Demonstration, had spent three days in Cattaraugus County and had not consulted the officers of the County Medical Society, or the local physicians, although agreement number seven stated that the Secretary "would use his best influence to bring together the President and the Executive Secretary of the Cattaraugus County Tuberculosis Association and the President of the Cattaraugus County Medical Society to arrange these

matters"

2 The Secretary and the agent of the Milbank Demonstration had gone to Chicago to a Conference on Public Health called by the A M A and had presented the point of view of the Demonstration, although agreement number two was "That the object of all publicity should be simply to inform the people of the county of the public health work which is being done, why it is being done, and why it should be done"

3 The Milbank Demonstration had rejected the offer of the Medical Society of the State of New York to send representatives to assist in planning the budget of the Demonstration for

the coming year

Dr Ross agreed with Dr Johnson that the story of the recent conferences over Cattaraugus County should now be published, but that its publication had been delayed because of the lack of precedents, and the evolutionary state of the subjects under discussion After Dr Ross had closed his explanation the House of Delegates

unanimously adopted the following resolution Resolved, That the House of Delegates of the Medical Society of the State of New York sustains and endorses the protest of the Cattaraugus County Medical Society in its opposition to the Milbank Health Demonstration as at present conducted by the State Charities Aid Association, because it (the Milbank Foundation), has not governed itself either in spirit or practice by the principles laid down by this Society for the conduct of its members in their relation to Public Health work conducted by lay organizations

The election of officers was held on the morning of Tuesday, May 22, and resulted as follows

President-elect, James N Vander Veer, M D, Albany, First Vice-President, Thomas H Farrell, M D, Utica, N Y, Second VicePresident, Edward W Weber, M D, White Plains, Speaker Emeritus, E Eliot Harris, M D, New York, Speaker, John A Card, M D, Poughkeepsie, Vice-Speaker, Walter D Ludlum, M D, Brooklyn, Secretary, Daniel S Dougherty, M D, New York, Assistant Secretary, Peter Irving, M D, New York, Treasurer, Charles Gordon Heyd, M D, New York, Assistant Treasurer, James Pedersen, M D, New York, Trustee, Arthur W Booth, M D, Elmira

Chairmen of Committees — Legislation Henry L K. Shaw, M D, Albany, Public Health and Medical Education Thomas P Farmer, M D, Syracuse, Scientific Work Arthur J Bedell, M D, Albany, Medical Economics W Warren Britt, M D, Tonawanda, Public Relations James E Sadlier, M D, Poughkeepsie, Medical Research Frederic E Sondern, M D, New York

Delegates to A M A, 1929 and 1930—James E Sadher, M D, Poughkeepsie, Arthur J Bedell, M D, Albany, John A Card, M D, Poughkeepsie, Arthur W Booth, M D, Elmira, Grant C Madill, M D, Ogdensburg, Thomas C Chalmers, M D, Forest Hills, Frederick H Flaherty, M D, Syracuse

Alternates — E Livingston Hunt, MD, New York, George W Cottis, MD, Jamestown, Charles H Goodrich, MD, Brooklyn, Andrew Sloan, MD, Utica, Richard E Townsend, MD, New York, Robert L Reid, MD, New York, Henry C Courten, MD, Richmond Hill

Dr E Eliot Harris would have been re-elected Speaker of the House of Delegates if he had not refused to consider accepting the office on account of physical inability to perform its duties. The House therefore by unanimous consent made him Speaker Emeritus

The proceedings of the House of Delegates were singularly free from contests and acrimonious debates, because the members came to the sessions well informed on the questions that are being considered by physicians and medical societies

The minutes of the House of Delegates will be printed in an early issue of the Journal

ans while he was a missionary in New Mexico and studied the Indian at close range and intimate acquaintance. He described the training of a boy in his preparation to become a medicine man and to practice medicine after the conditions of his ancestors. The boy learned the prayers to be made to the Dispenser of Life and Health so that when he is called to a home, the patient will believe that his medical powers have been bestowed upon him by the special favor of the Great Spirit

The young learner has impressed upon him the idea that he alone has been chosen from his tribe to be the recipient and dispenser of healing knowledge, and he practices his art in full belief of its efficiency. Much of the art of the medical Indian consists of mental suggestion. He beats his tom tom and tells the patient over and over "I am the strong man, I have the power, you will be well, sleep and rest." The Indians prescribe fasts, sometimes lasting for four days, and often

with excellent results The woman with a sick baby on her back will gather herbs which she herself will take on the theory that the virtue of the herbs will pass into the child with her milk Sweat baths followed by plunges in the cold river are also frequently prescribed Dr Vruwink also described a drug used by the Indians as a narcotic, which prolongs the sense of time and induces fantastic dreams and visions which Indians interpret as scenes of heaven The Indians perform a religious ceremony by sitting in a teepee and chewing the drug until they see and hear glorious things of the spirit world The Government does not enforce the narcotic act and suppress the use of the drug because to do so would interfere with a religion and with agelong customs in which the Indian believes that he goes to the spirit world and lives in heaven for days at a time

Altogether the annual meeting was one of unusual interest and value

COMMERCIAL EXHIBITS

The Commercial Exhibits were arranged with unusual care and completeness, and covered almost the entire floor of the Armory Most of the exhibitors were advertisers in the Journal and were anxious to promote the welfare of the State Medical Society in every possible way because the deep interest of the physicians in the Journal means an increasing number of readers who are interested in the announcements which it carries

The advertisers who tell about the goods in the Journal valued the opportunity to meet the doctors and to show them their wares. Since the State Medical Society sold exhibit space just as it sold pages of advertising in the Journal, the obligation to supply an audience was analogous to that of sending the Journal to a certain number of readers. Doctors generally do not realize their debt to the dealers in drugs and other supplies, and do not go out of their way to seek him. It is therefore necessary to locate the exhibits where the maximum number of doctors congregate

The Committee on arrangements had intended that the sections on Medicine and Surgery should occupy two rooms at the far end of the Armory so that those attending the sections should pass the full length of the Exhibit Hall. The permission to erect a board partition was denied by the State authorities, and a curtain was used in its place, but the unexpected condition developed that all the sound of the main floor became concentrated in the meeting rooms, making them too noisy for use. The sessions therefore adjourned to other buildings thereby taking away a large proportion of the physicians whom the exhibitors expected to reach. This lack of facilities for creating an audience was unfortunate, for the exhibitors were not only of the highest standing

among physicians, but they had planned their exhibits with unusual care for attracting the attention of the physicians as well as to obtain orders for their wares. The officials of the State Medical Society did all that was possible to correct the defects even to having handbills printed and distributed to all the sections and to all that entered the Armory. These handbills called special attention to the high class of the exhibits and especially requested the physicians to call at the booths.

In view of the conditions in the Armory the exhibitors made the suggestion that the meetings of the State Medical Society be held in a hotel which could accommodate all the features of the program under one roof. This suggestion is discussed editorially on page 664 of this JOURNAL.

The Managers of the exhibits had planned the new feature of holding the manufacturers' section in connection with the exhibits, and had provided a large meeting room equipped with stereopticons and moving picture machines, and had myited a number of exhibitors to demonstrate their wares in a scientific way after the manner of the scientific sections Eight exhibitors responded and submitted either a written lecture or an outline of a talk or moving picture reel The plans were apparently perfected in all details, but their execution was difficient because of the lack of a sufficient audience Physicians who happened to be near the entrance of the room when a lecture was announced would enter, but few would seek the room as a result of reading an announcement in the official program of the annual meeting The plan was entirely practical, but physicians were not aware of the instructive and interesting character of the sessions

BANQUET

The annual banquet of the Medical Society was held on the evening of Tuesday, May 22nd, in the Ball Room of the Ten Eyck Hotel, with

over 275 members and guests present

The dinner was marked with an unusual degree of good fellowship. Of special note was the reunion of the members of the Class of 1883 of the Albany Medical School. The Class numbered 56, of which 14 are living and 8 were present at the banquet. Those present were Drs. John H. Stephens, New Hartford, N. Y., Irving D. LeRoy, Pleasant Valley, N. Y., C. F.

Wharton, Richmondville, N Y, J F Reilly, Rensselaer, N Y, J Wilson Poucher, Pough-keepsie, N Y, Charles P McCabe, Greenville, N Y, Frank T De Lang, Rockville Center N Y, Herbert L Odell, Sharon Springs, N Y

Immediately after the banquet, the tables were removed and the hall was prepared for the annual meeting of the Medical Society of the State of New York. The speaking at the meeting took the place of the usual after-dinner addresses. This innovation proved to be successful and the hall was filled to capacity for the meeting.

ANNIVERSARY MEETING

The Charter of the Medical Society of the State of New York requires that the organization shall hold an annual or anniversary meeting, but it does not prescribe its character or what business, if any, shall be transacted

The President of the State Society, Dr. James E. Sadlier, introduced Governor Alfred E.

Smith as the guest of honor

The Governor gave an intimate account of the detailed duties of the Chief Executive of New York State. He receives requests from the school children for data for debates on capital punishment, and acts as host for foreign delegates who make lengthy speeches, and he must greet grooms who wish to impress their own importance on their brides, and once he was manager of the Capitol building for a whole winter and signed the coal bills while the other members of the Commission were absent, but conditions are now much better since there are only seventeen departments of the State business, instead of 153 as before the organization of the State machinery

Governor Smith said that he knew medicine from the standpoint of the State which required physicians to undergo tests just as do banks and insurance companies A man can stand a poor lawyer, but not a poor doctor, for he can reason out a law question, but not medical science In 1908 the State stopped the use of the word "Bank" by Department Stores, and anyone else who will not submit to the regulations of New York State By the same reason the State for-bids the use of the word "Doctor" except by a trained physician, for when the patient calls a physician, it means that he has exhausted his own resources and calls a doctor as a last resort. The Governor related his experience while he was President of the Board of Aldermen returned to duty after a sickness from rheumatism, a portly policeman told him that if he had come to him he could have prevented the rheumatism for all he had to do was to sprinkle some sulphur in his shoes

The Governor said that a diversity of interests

exists in the State and it is difficult to create a public opinion of much weight and size. The propagandist persists until he gets a following, while the right-minded man depends on the integrity of his problem and is not always successful For this reason the State needs the help of Rotary clubs, bar associations, women's clubs, and other organizations, and especially the aid and support of societies of physicians in the solution of problems of a civic nature

The President then introduced Dr Harry R. Trick, the new President, who had already begun his official duties by presiding at an organization

meeting of the Council in the afternoon

Dr James E Sadlier then gave the annual President's address, which is printed as the first article in this JOURNAL Striking excerpts from his address are also printed on page 662 of the

editorial department

Dr James S Sullivan, Ph D, of the State Department of Education, Deputy Commissioner for Professional and Higher Education, was next introduced, who said that he knew medicine as history better than as a science. Some problems of medieval medicine were almost insurmountable in France in the Fourteenth Century, when one out of every two persons was disfigured with the marks of smallpox, and yet today there exists in the United States organizations for the purpose of opposing vaccination. The sterilization of the unfit is still a measure of the future which will have to be taken up in order to protect society from the unfit which flourish now as they did five hundred years ago.

Dr Sullivan considers that the medical profession is overcrowded and that an overcrowded profession is one of low standards. He sees no prospect of inducing doctors to settle in rural communities. He closed with a plea for the continued education of doctors by means of courses which shall include actual practice as well as

reading and correspondence

The Rev Henry A Vruwink, Pastor of the Madison Avenue Reformed Church of Albany, told of his medical observations among the Indi-

SCHOOL EXAMINERS' CONFERENCE

A dinner conference of the Medical Examiners of School Children was held on Monday evening with Dr William A Howe, Director of the Bureau of School Examinations in the State Department of Education General topics were discussed, including the promotion of the employment of dental hygienists,—a plan which is endorsed by dentists generally

The Conference also discussed the newspaper report that the work of the Medical Examination of School Children would be combined with that of their physical training, and that the combined work should be under the Director of Physical Training. The physicians attending the Conference felt that the subordination of purely medical work to a director untrained in medicine was

wrong in both principle and practice. The physical training division stresses the production of winning teams and the promotion of spectacular games, while the medical examinations work consists in discovering physical defects, and prescribing for their correction There is also a border line condition in which ordinary children are neither athletes nor defectives. The children in this group are not strong enough to be of interest to the physical trainer, nor sick enough to receive the personal attention of the doctor question is, who can reach this group of children best, the physical trainer or the doctor? The ideal method would be that the physical trainer should give exercises to these children upon the prescription of the doctor

PUBLIC HEALTH EDUCATION IN MIDDLETOWN

One element of success in public health education is that it shall be interesting. Dr H J Shelley, health officer of the City of Middletown, New York, has hit upon a plan which attracts and holds the attention of the readers, be they young or old He issues a mimeographed Bulletin monthly, which contains items regarding the activities of the Board of Health written in a bright, simple But its special attractiveness are the cartoons which it contains, two of which are reproduced with this article. The cow in the bath tub enforces the idea of cleanliness in milk production, and accompanies a page description of the new milk code The cartoon call for clean-up week is far more effective

than pages of printed appeal
Dr Frank W Laidlaw, District State Health
Officer who lives in Middletown, has also made
use of cartons in the mimeographed Bulletin
which he sends to his health officers every

month, a copy of which was reproduced on page 310 of the March first issue of this JOURNAL

Mayor Macardell has designated the week beginning May 7th as

We're On Our Way, Mayorl

feature of the program may be developed provided the exhibits are held in the same building with the other features of the program

The exhibits in the Manufacturers' sections

have confirmed the opinion of those who came in close contact with the dealers in medical wares that the ethics and science displayed by the exhibitors were identical with those of physicians

EXHIBITORS' RECEPTION

The program of the Commercial Exhibits was begun on Monday evening, May 21st, with a reception to those in charge of the exhibits. This reception was held in the Hotel Ten Eyck and was attended by over one hundred exhibitors.

The program of the evening was opened with brief addresses by Drs Wightman, Sadlier, and Van Cott, in which the speakers referred to the high character of the exhibits and the necessity of the wares to the doctors. The response of the advertisers was the best indication that the Journal was being read by the physicians. When a physician reads the Journal and is pleased with it, he says nothing about it, but when an advertiser reads the Journal and is satisfied with it, he forthwith gives an order for more advertising

The increased receipts from the advertising pages are proof to the editors that physicians read the Journal and profit by what they read

Dr Wightman, who presided at the introductory meeting, called on several of the exhibitors Mr P G Bray of the Livermeal Corporation, said that every day inquiries come to his Company as a result of advertising in the New York State Journal of Medicine Mr W P Schmidt, representing the Cameron's Surgical Specialty Company, gave a humerous description of some of his experiences in getting by the nurses who guard the doors of the

doctors' offices He said that the advertisers all appreciate the fact that they are welcomed in the editorial offices of the New York State Journal of Medicine, and that they are treated with cordiality Mr Storer of the John Curtiss Company, Inc, said that he was an advertising agent, and that he therefore stood between the advertiser and the Medical Journal One of his problems was how to restrain an enthusiastic dealer from over-estimating the value of his own wares, however his enthusiasm was but natural and he usually found that the advertiser was quite willing to have the medical men edit his copy and make it entirely truthful and scientific

Dr Wightman described the proposed Manufacturers' Session or Section which would be introduced this year as an experiment. The plan was that a room would be provided with lanterns and could be used by invited advertisers who would exhibit their wares after the manner of the speakers in a scientific session. Dr Wightman said that he felt that the dealers and manufacturers could be trusted to put on a program which would be every bit as scientific and ethical as that of the medical men themselves

Following the opening program an entertainment was given by talent from New York and Albany

The evening's program closed with refreshments

CONFERENCE OF DISTRICT HEALTH OFFICERS

It has long been the custom of the State Department of Health to hold a conference of the heads of divisions with the District State Health Officers at the time of the Annual Meeting of the Medical Society of the State of New York The conference this year was held on Tuesday morning in the rooms of the State Department of Health The principal topic of discussion was the new milk code which goes into effect throughout the State of New York on July first The fifteen District State Health Officers have done an immense amount of work in instructing the one thousand health officers of the State regarding the standards of the code The essential point of the new regulations is that bacterial counts are made the principal basis for judging the purity and wholesomeness of milk

are an immense number of details to be worked out regarding the enforcement of the code. It is the intention of the State Department of Health to emphasize its enforcement in the cities and larger villages first, and to extend the work in widening circles into rural communities.

The Deputy Commissioner of Health, Dr Paul B Brooks, announced that he was about to start for Europe in order to attend the World's Dairy Congress which will be held in London, Edinburgh, and Glasgow between June 26 and July 13 Dr Brooks has been appointed by Governor Smith to be a delegate from New York State He will also represent the International Association of Dairy and Milk Inspectors The District State Health Officers presented Mr Brooks with a travelling bag

new acini (adenoma) These changes give rise to a variety of clinical conditions and formerly much confusion resulted from a lack of uniformity in terminology and simplicity in the classification of pathologic thyroids Henry S Plummer is probably the one who clarified the situation and classified goiter as follows

- (1) Simple goiter (colloid, adolescent)
- (2) Adenomatous goiter (toxic or non-toxic)
- (3) Exophthalmic goiter (Graves', Basedow's or Parry's disease)
 - (4) Carcinoma, tuberculosis, thyroiditis, etc

"The value and importance of this classification is emphasized by the successful management of goiter patients. It means that proper treatment is entirely dependent on a correct diagnosis because of a definite and constant relationship between the clinical symptoms and pathological conditions which exist in cases of hyperthyroidism. In the treatment of these cases many procedures have been suggested and used. The claims of success are at times enthusiastic and again pessimistic.

"After observing several hundred cases I am convinced that surgery offers the principal mode of attack, and by it the most efficient and beneficial results are obtained Surgery however, is not the primary mode of attack Certain preliminary measures are not only essential, but are definitely the factors which influence both the immediate and late mortality statistics in these cases

"There is no standard preoperative treatment because no two cases will show the same degree of toxicity. Hence the variability in preparation. In exophthalmic goiter—rest, iodine and high caloric diet are the fundamentals. In adenomatous goiter with hyperthyroidism the principles are similar except that iodine is not used. Many non-toxic adenomatous cases are rendered toxic by the unintelligent use of iodine. The use of digitalis in these cases must be avoided rather than used.

"Surgery in these cases should only be done by men who are trained in the field and who know when not to operate in a crisis The amount of surgery may produce more harm than good Essential elements in caring for these cases are hemostasis, adequate exposure and team work A successful operation does not terminate the supervision of the case Either the surgeon himself or he should instruct the family physician in the fundamentals of rebuilding the injured nervous system, muscle system and blood At the present time in well organized teams—the mortality in hyperthyroidism is remarkably low and should stimulate physicians to send their cases early be fore visceral degeneration is manifest

Discussion by Drs J S Thomas, W H Barber, E E Smith, and T M D'Angelo and closed by Dr Sullivan

The following reports were received

For the Comitia Minora, E E Smith, secretary, for the Board of Censors, E A Flemming, chairman, who moved the election to membership of the following approved and recommended by the Board of Censors

The following doctors were elected to active membership Peter Byron, Corona, L I, Edward M Douglas, Jamaica, Harry Goldberg, Elmhurst, Harry Hanfling, Jamaica, Forrest Hayes, Flushing, Leslie Katona, Flushing Heights, T Roy Peyton, Jamaica, Charles M Reid, Jamaica, Hyman Rivkin, Far Rockaway, Mitchell Jay Rabinowich, Jamaica, Archibald Oliver MacDonald Wood, Far Rockaway

The following internes were elected to associate membership Harry Altner, M D, Rockaway Beach Hospital, William D Stein, M D, Rockaway Beach Hospital

The following were received by transfer Louis A Gryte, M D, Queens Village, James H Watts, M D, Little Neck, Irving Simons, M D, Forest Hills

For the Board of Trustees Dr Chalmers reported upon the plans of a building for the Society to be erected on one-half the property now held by the Society on Queens Boulevard in Forest Hills The contemplated façade and floor plans were shown by lantern illustrations. He further reported on the estimated cost not to exceed \$250,000 00, the estimated annual income from rentals to the amount of \$17,132 00 and the estimated cost of maintenance to the amount of \$10,800 00. He thereupon, moved the adoption of the following resolution submitted by the Board of Trustees

Resolved, That the tentative plans as submitted by the Board of Trustees be adopted as representing the requirements of a building for the Medical Society of the County of Queens, provided that the total cost of building and equipment shall not exceed \$250,000 00, and

Be It Further Resolved, That the Board of Trustees be and are hereby empowered to make such changes as may be deemed expedient or commensurate with the amount of building fund raised, and that they shall be empowered to make all necessary contracts and financial arrangements to complete this project Motion carried

Upon the offer of Dr. Rohr that at least ten speakers from the public speaking course were available now for addressing lay bodies Dr Flemming moved that the matter be referred to the Committee on Public Health and Public Relations, and that they be requested to report at a future meeting regarding the utilization

CATTARAUGUS COUNTY MEDICAL SOCIETY

The annual meeting of the Cattaraugus County Medical Society was held Tuesday evening, May 1st, at the Dudley House, in Salamanca

The meeting was a very enjoyable one, and was attended by 29 members

Following dinner, a short business session was held The chief matter of business was the election of officers The following men were elected

Charles A Lawler, Salamanca, President, Leo Reimann, Franklinville, Vice-President, Raymond B Morris, Olean, Secretary-Treasurer, Joseph P Garen, Olean, Delegate, Leslie J Atkins, Olean, Alternate The membership application of Dr C G Steinhauser, of Cattaraugus, was reported, and favorably acted upon He was elected to membership

Following the business session the membership were presented with the following scien-

tific program

George J Eckel, Buffalo—"Kidney Lesions Their Significance," William D Johnson, Ba-

tavia-"Surgery Past and Present"

Both addresses were interestingly delivered, without notes Being an unusual departure from the more common type of prepared paper, they were enthusiastically received

R R Morris, Secretary

WYOMING COUNTY

The regular quarterly meeting of the Wyoming County Medical Society was held in Perry, N Y, at the Hotel Commodore April 17, 1928 A dinner in the convention room was given by the Society in honor of Drs J E Slaught of Warsaw and John Harding of Perry, commemorating their fifty years of ethical medical practice. They were presented with flowers by the Society. Dr Slaught was presented with a gift from the physicians of Warsaw and Dr Harding a gift from the psysicians of Perry Dr M J Wilson and Dr L M Andrews spoke of the accomplishments of Dr Slaught and Dr P S Goodwin and Dr J R Brownell spoke of the accomplishments of Dr Harding

The meeting was then called to order by President Klostermyer Dr Robert E Plunkett, Director, Division of Tuberculosis, New York State Department of Health, addressed the Society on the subject "The need for Early Diagnosis and Early Reporting of Tuberculosis" The address was illustrated by a two film motion picture "The Doctor Decides" The pictures were shown in the Auditorium Theatre

The address and pictures were very interesting and instructive and were much appreciated by all the members and their guests Twenty members and fourteen guests were present

HENRY S MARTIN. Secretary

QUEENS COUNTY

A regular meeting of the Medical Society of the County of Queens was held at Eagle Palace, Jamaica, April 24, 1928, at 8 30 P M, with the president, F G Riley, M D, in the chair

A paper, Hyperthyroidism, Its Surgical Aspects, was given by Raymond P Sullivan,

M D, of New York

Dr Sullivan spoke in part as follows

"Hyperthyroidism is a physiological status that pertains when the amount of thyroid product, known as thyroxin, exists in the tissues of the body above normal. Under normal conditions the thyroxin content is maintained at about 14 mg. The average person discharges approximately 0.75 mg daily

"Hyperthyroidism occurs in three states (1) following the administration of thyroid gland or its active agent, thyroxin, (2) in persons having exophthalmic goiter Mild hyperthyroidism is sometimes present in other conditions, as in essential hypertension and certain psy-

choneurotic states Also occasionally in cases of diffuse colloid goiter with or without areas of hypertrophy in which there is not sufficient evidence to classify them either with endemic goiter or exophthalmic goiter

"In order to properly understand the pathological condition of thyroid, one must have clearly in mind the normal histology of the gland. It is constituted of vesicles lined with cuboidal or low columnar epithelium supported by sustentacular tissues common to gland structure. Within the cells are granules, vaciloles and protoplasmic bodies mitochodria. New acini are probably formed in intervesicular spaces by the reserve parenchymal cells. Pathologically three types of structural changes within the thyroid are most frequent, viz, (1) flucations in the amount of colloid stored in the vesicles (colloid goiter), (2) hypertrophy or hyperplasia of the vesicular epithelium (exopthalmic goiter), (3) the development of

MEDICAL WARES

SURGICAL HOSE

Supports for swollen legs and varicose veins have been used from time immemorial. The earliest form was the long, narrow bandage wound round and round the limb. The roller bandage is still effective when it is put on every morning and removed at night, but in these day of short skirts the women demand something

thin and sightly

The supports which have been devised by physicians and makers of orthopedic apparatus have undergone a surprising evolution in three stages in each of which an entirely new principle has been introduced First was a canvas legging rudely shaped to the leg and laced on the front or side. It was bulky and heavy and often became creased, it gave relief, especially when it was properly fitted to the limb and was well adjusted While it was only a crude piece of apparatus, yet it was widely used, for it is cheap and durable and, to a certain extent, adjustable. It is still a form of support to be prescribed for poor persons who must be on their feet during their work. These persons are not concerned with appearances, but they desire a degree of relief that will enable them to continue their work and earn a living Physicians will do well to remember the existence of this old form of canvas support, when they seek to relieve a day laborer from the disability of varicose veins

Following the canvas legging came the woven elastic stocking In its latest form its horizontal thread is made of rubber string, and the vertical The rubber weaving is ordinary linen thread string is about the size of the lead of an ordinary pencil, and is covered with woven thread stocking is designed to exert a constant pressure upon every part of the limb, in whatever position the limb may be The first stockings were woven flat and their edges were sewed in a seam Later, methods were devised to weave the stocking without a seam, but the most improved rubber elastic stocking has its serious limitations Its rubber is subject to deterioration in a few weeks like the rubber of an ordinary garter If the stocking covers the knee, it becomes tightened when the knee is flexed, as in standing, and so it is likely to stretch in one part more than another A new stocking is likely to be too tight, and when a few weeks old, too loose Moreover, the rubber stocking is thick and hot and causes itchings and eruptions of the skin. The greatest objection to an elastic stocking was that the pressure which it exerted was continuous, and was in operation whether it was needed or not, yet this form of hose represented the peak of progress in surgical hose for decades and thousands of persons have worn them with satisfaction

The most recent advance in the evolution of surgical hose is the application of a lifting support by means of a peculiar weave of the fabric. The principle of its action is like that of a collar employed to pull a telephone cable through the conduit. The rope is attached to the cable by means of a collar whose bands are interlaced spirally so that traction causes the collar to grip the cable with a force which is directly proportional to the pull on the rope. The harder the lengthwise pull, the tighter the grip on the cable

The newest form of surgical hose act on the same principle. It is made of a soft, web-like material which yet is firm when it is stretched. On pulling it lengthwise it becomes narrowed in its diameter and so grips the limb snugly. The hose is usually made to reach from the middle of the foot to the middle of the thigh and its top is supported by a garter attached to the corset in such a way that it exerts compression when the wearer stands, but relaxes when she sits. Thus an adjustable pressure is exerted on the leg when it is needed as in standing, while it is relaxed during sitting when a support is not needed.

The newer surgical hose is light and inconspicuous, and can scarcely be detected when it is worn under a silk stocking. It does not depend on its constant close fit for its compression, but its action is uniform over the whole limb when traction is made on it by a garter. It embodies the desirable qualities of comeliness, effectiveness and comfort. It is also washable since it is made of linen, and being thin, it quickly dries

This new surgical hose is readily adaptable for men's wear by the use of a supporting belt, or suspenders, but women learn to wear it more readily because they are accustomed to stocking supporters

of such speakers Motion seconded and passed Under new business Dr Chalmers offered blanks for signatures of those taking bond issues

Dr Flemming addressed the society on the increase of malpractice group insurance rates, and read a resolution of the Executive Committee of the State Medical Society regarding the new schedule which had been arranged with the Aetna Life Insurance Company and

recommended by the Medical Society of the State of New York

President Riley reported on matters relative to the Department of Health and moved that the Society endorse Commissioner Harris' plan for food examiners Motion seconded and passed

Collation Attendance, 72

E E SMITH, Secretary

COLUMBIA COUNTY

The semi-annual meeting of the Columbia County Medical Society was held at the Holsapple House, Copake, N Y, Tuesday, May 8, 1928, with President Diefendorf presiding

Members present Drs. Bradley, Collins, Diefendorf, Galster, Garnsey, Johnson, Mambert, Nichols, Post, Robert, G. W. Rossman, C. G. Rossman, Raabe, Skinner, Van Hoesen, Vedder and Whitbeck and Dr James A Sadlier, President of the Medical Society of the State of New York as guest

Dr S V Whitbeck, Chairman of the Committee on Public Health and Post-Graduate Education, reported that a series of four lectures had been given at the Hudson City Hospital during the month of April on Physio-therapy by Dr

Richard Koyacs of New York City

The Secretary reported that the petition authorized by the society at its meeting last October to the Board of Supervisors for the establishment of a State Aid Public Health Laboratory had been approved by the Board of Supervisors and \$4,000 appropriated as the county's share, and that the Common Council of the City of Hudson had also appropved the petition Inasmuch as the Hudson City Hospital had refused to cooperate with the society, the supervisors had deferred the naming of the Board of Managers

On motion of Dr Van Hoesen the society voted

approval of the following resolutions

Resolved, that the Columbia County Medical Society approve the Laboratory about to be established by the Hudson City Hospital and agree to support and cooperate with such laboratory in its work

Resolved, that the previous resolution of October, 1927, relating to the request from the Columbia County Medical Society to the County Board of Supervisors for the establishment of a State Aid Public Health County Laboratory be rescinded

On motion of Dr Bradley a committee of three, Drs Whitbeck, Collins and Garnsey were

appointed to draft a resolution on the death of Dr Frank B Wheeler

On motion the President appointed Drs Mambert and Van Hoesen, a committee on Public Relations, to work with lay organizations for better public health condition in the county

Moved and seconded that the treasurer be authorized to pay for dinners Carried

The committee appointed to draft resolution on death of Dr Frank B Wheeler, offered the following

Be It Resolved, that the Medical Society of the County of Columbia through the death of Dr Frank B Wheeler, has lost one of great professional ability and high personal attainments He had acquired the confidence and admiration of our society and we deeply deplore the loss we have sustained through the death of a most faithful and loyal member

We extent to his widow and family our deepest

sympathy

Dr. S V WHITBECK, Dr. W D Collins, DR N D GARNSEY

The scientific session consisted of an account of an unusual case of dermatitis, probably caused by medication, by Dr N D Garnsey, and an exceptionally interesting and instructive address by Dr James A Sadlier, president of the state society on "Activities of the Medical Society of the State of New York" In his address Dr Sadlier stressed the importance of County Medical Societies cooperating with the efforts of the State Society, to make the medical profession the guiding influence in all public health endeavors

Before adjournment the society was entertained by a moving picture entitled "How Biological Products Are Made" The showing was made by Mr Schriever of Parke, Davis & Co and included Diphtheria Antitoxin, Typhoid Vaccine and Small-Pox Vaccine

C R SKINNER, M D, Secretary

EARLY MAN

This Journal has frequently quoted the daily papers in explanation of studies in the origin and evolution of man. The New York Sun of May 14 contains an article describing the fourth expedition of the American Museum of Natural History to the Desert of Gobi in Central Asia in quest of fossil remains of early man. The expedition is led by Roy Chapman Andrews who has headed the three previous expeditions, one of which resulted in the discovery of several nests of dinasaur eggs some 10,000,000 years old. The Sun quotes Mr. Andrews as follows.

"We believe man originated in Central Asia, because we know that for millions of years it has offered conditions most encouraging to his development. This plateau was high, lightly forested, with an exhilarating climate, providing the stimulus for the dawn man to develop and go forward. It is also the oldest continuously dry land in the world, because it remained above the

waters while the land masses of Europe and America were periodically rising and falling

"We know, too, that the area we are to search escaped the glaciation of the ice ages in Europe, during which it was a humid region, becoming dryer as the ice receded, becoming semi-arid, savannah country"

"The 'dawn man' which the present expedition hopes to find is believed to have existed back beyond the Pleistocene geologic era, in the Pliocene of a million years ago, or even the Miocene or Oligocene of two and three million years ago"

The account continues

"Andrew's first objective is an uninhabited area, 300 miles northwest of Kalgan, on the southern edge of the Gobi desert, where his previous expeditions found deposits of a geologic period which best promises to yield evidences of the "dawn man" if they are to be found. It is country much like the "bad lands" of the Dakotas, deeply eroded by the storms of eons."

GARDENS OF HEALING

The cultivation of medicinal plants does not interest physicians to such an extent as it did a century ago when every physician was his own pharmacist and his drug store was a "Doctor's Shop" Doctors today do not have to give much thought to the growth of vegetable drugs, and it is doubtful that many physicians would know a plant of digitalis or belladonna or veratrum viride if they should see one, as they frequently do in flower gardens and swamps. Yet the quantity of plants used in medicine is probably greater than ever, but the average doctor knows them only by their names on bottles and packages

The former importance of the industry of growing medicinal plants is indicated by the action of the Legislature of New York about a century ago in passing an excellent law establishing educational requirements for the practice of medicine and then making it of no effect by adding the provision that anyone could practice medicine provided he limited his work to prescribing vegetable products grown in New York State Since prescribing drugs was about all there was to the practice of medicine, quacks flourished in the land, especially the cult called Thompsonionism after a man who

capitalized the law. This cult and Homeopathy found ready acceptance by the people who revolted against the usual practices of bleeding and dosing with mercury

Growing medicinal plants is of so much importance that the University of Washington maintains an experimental garden, concerning which the New York Herald Tribine of May 16

says editorially

"This particular garden, it appears, is the largest of its kind in the world. The university is preparing to send out newly raised medical herbs and drug plants to hundreds of collectors. The list of foreign countries applying for medical plants and seeds, it is interesting to note, is headed by Germany. The aim of the university garden is 'to serve the world in propagating plants with healing properties." A worthy aim indeed! The announcement comes sweetly as the fragrance of the healing plants. In a world in which so much ingenuity is devoted to perfecting engines of destruction, it is reassuring to know that means for the alleviation of pain come in for some attention, too

"We envy the caretaker of the garden his job We think of him as a placid man, with a quiet voice and an easy conscience"

THE DAILY PRESS

SNAKE SERUM

Publicity regarding snake serum is one of the public health services rendered by the daily news-The editors of this Tournal have found the newspapers to be their chief source of information regarding snake serum, whose production is promoted by Raymond L Ditmars, Curator of Reptiles in the New York Zoological Park This Journal of July 1, 1927, page 743, described a trip of Dr Ditmars to Algeria to investigate the immunity of snake charmers to cobra poison-Dr Ditmars has recently been to Honduras where the increasing number of deaths from snake bites is causing apprehension among banana A banana plantation is a harbor for all kinds of snakes, which find hiding places in the dangle of fallen leaves which cover the The New York Herald Tribune, of May 14, says editorially

"One Central American fruit company alone reckons with a loss from snakebites of 200 laborers annually It is on a plantation of that company that Douglas March has established the famous serpentarium which Dr Ditmars has just visited. When the plantations are cleaned up he follows the machetemen on the watch for snakes, and the more poisonous they are the happier Mr March is. Coral snake, fer-de-lance, parrot viper—he seeks them all, herds them in separate pits, then milks them regularly of their poison. Minute quantities of the venom he injects into horses, and gradually he increases his doses until nature has built up in the animals an immunity to the toxic agent. This can be passed on to men through the serum of their blood."

Arrangements have been made with the H K Mulford Company to manufacture and distribute snake serum under the name of anti-venin Two forms of the serum are made, both polyvalent—one against the snakes of North America and the other against those of South America

GLANDS AND BEHAVIOR

The question, why evil is in the world, now vexes physicians and psychiatrists even more than it does theologians. An explanation of poverty was that the poor were created in order that the rich might have the opportunity to exercise the virtue of charity. The criminal insane were possessed of the Devil and the victim was killed in order thereby to reach the Devil

The most recent explanation of poverty and crime is that they are due to an endocrine disturbance. An article by Dr. Walter Timme in the Neurological Institute Bulletin on the stimulation of criminal tendencies by glands receives editorial comment in the New York Herald Tribune of May 11, which says

"All too frequently the workings of the public mind remind one of those magnifying glasses held so often in pictorial advertisements to pick out one phrase or sentence from a background of printed type and make that statement readable to the exclusion of its context. The contributions of gland disorders to the production of crime are unquestionable. It

is undoubtedly the duty of neurologists and gland experts to investigate them. We hope to see forthcoming the funds for which the Neurological Institute asks. But glands are not the only basis of criminality. There should still be room in that instinctive jurisprudence which we call public opinion for the homely, old-fashioned theory of natural cussedness.

"But let us avoid as a softening canker of decay the idea that, after all, these poor murderers and thugs and highwaymen are not responsible for what they do Nearly everything that man has won from a reluctant Nature must be credited to the doctrine of individual responsibility. Neither glands nor sympathies nor behavioristic philosophies will do the world a service if they persuade us to abandon this keystone of the social arch."

Physicians would go a step further If a person is defective in mind because of an endocrine disorder, he yet needs to be restrained and placed under care. The principal question is whether the place of restraint should be a jail or a hospital, or both

BOOK REVIEWS

HANDBOOK OF OPHTHALMOLOGY BY HUMPHREY NEAME, F.R.C.S and F. A. WILLIAMSON-NOBLE, F.R.C.S Octavo of 312 pages, illustrated. New York, William Wood and Company, 1927 Cloth,

The authors of this little work seem to have carried out their object very well. They state in the preface that the volume is for the undergraduate, the beginner in ophthalmology and the general practitioner

The work is very well developed in a clear and concise manner and the diction is simple and easy to follow A very definite plan has evidently been used. The many very satisfactory illustrations add greatly to the value of the book. Many of these are original with the writers and sufficiently unusual to be very worthwhile for any ophthalmologist to study

The authors avoid the more unusual and intricate aspects of ophthalmology and yet supply very definite and substantial matter for those for whom the book has J N Evans

UR TIMES I The United States, 1900-1925 II. America Finding Herself By Mark Sullivan Octavo of 668 pages, illustrated New York and London, Charles Scribner's Sons, 1927 Cloth, \$500 OUR TIMES

Mark Sullivan has written a book that will never be out of date. It is one of those books that make good reading this month, will be as interesting five years from now, and twenty years from this date will be reread by the present generation with chuckles and interest and by our children then grown to maturity

Just now it is a book that fascinates anyone beween forty and sixty years and up to old age. To the youth in his twenties it will thrill and amuse.

It is a book for facts dealing with events, movements, people and customs during the last thirty years

Usually the blurb on the jacket is written to entice the unwary book-buyer, but in this instance we can quote in toto and mark it accurate in every detail. It says, "Here is a new kind of history, which weaves into its fabric the stuff of every-day life—plays, songs, poems, novels, fads and fashions, new inventions, big business -the lot of the average man as well as the brilliant careers of such outstanding personalities as Roosevelt, Morgan, Carnegie, Hill, Harriman, Rockefeller"

"From the first chapters, which give the setting for the men and women of our time, through the years of Roosevelt's administration, the drama is presented with such vividness that there is not a dull page in the entire volume.

It is generously illustrated Just the book for the physician to pick up and read a half hour or so every evening before bedtime. We re-echo there is not a dull page in the entire volume.

NUTRITION AND DIET IN HEALTH AND DISEASE. By JAMES S McLester, M.D. Octavo of 783 pages Philadelphia and London, W. B. Saunders Company, Cloth, \$8 00

The collection in one volume of many analyses of foods makes a book of value. There has been much empiricism in the past as to the nutritive value of many This is no longer necessary Most of the foods have been analysed as to the chemical and vitamin content. The first section of this book presents all of these data in an admirable form, and where debate exists reference is made to a source where the various views on the subject are expressed.

After the presentation of accurate data, the author applies the information to practise. The tempo of the

book changes here. From figures varying from one to three to the right of the decimal, the author introduces and recommends very inaccurate methods for applying the data. His methods in the treatment of diabetes are such as have led to the downfall of many patients in past years The diabetic patient takes food as a medicine, and to get good results the food must be measured The tablespoonful and saucer method is a relic of bygone days Diabetes is a quantitative disease, and must

be managed in a quantitative manner

The coarse vegetable and bulk method of treating constipation is recommended. We wonder how many doctors ever get good results by this method Personally our experience has been very poor, and we consider it nearly a worthless method If a person has no intrinsic disease of the bowel, nor extrinsic disease of the nervous mechanism, and not myxedema, we have found that if the bowels are left alone, they will become regular after a time. The patient must go through a period of dis-comfort to accomplish this The coarse foods act as irritants, the same as cathartics Each year more bulk has to be consumed, the same applies to bran The author calls attention to the health of ancients who lived largely on portein foods, and who ate very little bulk. A study of Greek literature shows that at the height of their culture very few foods of a bulky nature were eaten The diet consisted of roast meats, cheese of goats' milk, milk, honeyed wine, wheat bread, corn, and wines We think the doctor contradicts himself in this section, and we are sure that a radical revision needs to be made on the subject of the treatment of constipation

The known facts concerning the vitamins are presented, and the foods in which they are most abundant are tabulated Their relation to health and disease is

discussed.

The book is a splendid contribution to the literature in dietetics. The many advocates of dropped organs on dietetics will find the author's viewpoint of worth

J ARTHUR BUCHANAN

An Introduction to Clinical Perimetry By H. M. TRAQUAIR, M D Quarto of 264 pages, with 164 illustrations St. Louis, C. V Mosby Company, 1927 Cloth, \$13.50

With the tremendous growth of medicine and the necessary splitting off of the specialties the most elaborate and technical-Ophthalmology-was not only the first but of itself has expanded so rapidly as to well nigh need further sub-division. In fact many eye specialists are known because of their interest in a special division of the work. Visual field studies have offered an opportunity for such special attention because every branch of medicine and surgery extends into this sphere

A work on visual field studies would fill many volumes were an attempt made to cover this subject completely

Traquair has wisely selected as a title for his work "An Introduction to Clinical Perimetry" One must not understand from this, however, that the subject has not been carefully presented The material is particularly well developed and is of extreme value. Every page presents many valuable truisms in a simple and precise manner Dr Traquair emphasizes "quantitative" perimetry throughout.

The reviewer spent a most pleasant and profitable ten days in reading this work of Traquair and would strongly recommend every ophthalmologist to do the same at his earliest opportunity because of the great help it will be in the interpretation of conditions met daily in one's practice,

2

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our residers.

- FOOD INFECTIONS AND FOOD INTOXICATIONS BY SAMUEL REED DAMON, A M, Ph D Octavo of 266 pages, illustrated Baltimore, The Williams & Wilkins Company, 1928 Cloth, \$400
- De Lamar Lectures, 1926-1927 The Johns Hopkins University, School of Hygiene and Public Health By F Neufeld, and others Octavo of 223 pages, illustrated Baltimore, The Williams & Wilkins Company, 1928 Cloth \$500
- STATISTICAL REPORT OF THE HEALTH OF THE NAVY FOR THE YEAR 1925 Admiralty, October, 1927 O Murrary, Secretary Octavo of 139 pages London, His Majesty's Stationery Office, 1927 Paper, 4s 6d
- TREATMENT OF DISEASE IN INFANTS AND CHILDREN BY HANS KLEINSCHMIDT, M.D. Authorized translation of the fifth German edition with additions by HARRY M. GREENWALD, M.D. Octavo of 359 pages Philadelphia, P. Blakiston's Son & Company, 1928 Cloth, \$500
- LOCAL ANESTHESIA A Short Course for Students and Surgeons By Géza de Takáts, M D Octavo of 221 pages, illustrated Philadelphia and London, W B Saunders Company, 1928 Cloth, \$400
- SURGICAL CLINICS OF NORTH AMERICA Vol 8, No 1 February, 1928 (Lahey Clinic Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.
- Understanding Human Nature. By Alfred Adler. Translated by Walter Béran Wolfe Octavo of 286 pages New York, Greenberg, Publisher, 1927 Cloth, \$3 50
- THE MECHANICS OF THE DIGESTIVE TRACT AN Introduction to Gastroenterology By WALTER C ALVAREZ, M D Second Edition Octavo of 447 pages, with 100 illustrations New York, Paul B Hoeber, Inc., 1928 Cloth, \$7 50
- PATHOLOGICAL PHYSIOLOGY OF INTERNAL DISEASES Functional Pathology By Albion Walter Hewlett, M D Revised in memoriam by his colleagues, Thomas Addis and others Under the editorial supervision of George DeForest Barnett Octavo of 787 pages, with 164 illustrations New York, D Appleton and Company, 1928 Cloth, \$8 50
- GYNECOLOGY By HOWARD A KELLY, AB, MD, and collaborators Octavo of 1043 pages, illustrated. New York, D Appleton and Company, 1928 Cloth, \$1200
- Post-Mortem Appearances By Joan M Ross, M D Second Edition, 16mo of 225 pages London and New York, Oxford University Press, 1928 Cloth, \$2 50 (Oxford Medical Publications)
- THE ABDOMIAL SURGERY OF CHILDREN By L E BARRINGTON-WARD, Ch M, FRCS Octavo of 283 pages, illustrated London and New York, Oxford University Press, 1928 Cloth, \$450 (Oxford Medical Publications)
- THE SURGICAL TREATMENT OF MALIGNANT DISEASE.
 By SIR HOLBURT J WARING, MS, MB Large octave
 of 667 pages, illustrated London and New York,

- Oxford University Press, 1928. Cloth, \$1500 (Oxford Medical Publications)
- A COMPEND OF PHARMACY By F E. STEWART, Ph.M., M D Tenth Edition, revised 12mo of 199 pages Philadelphia, P Blakiston's Son & Company, 1928 Cloth, \$200
- MEDICAL CLINICS OF NORTH AMERICA Vol 11, No 5
 March, 1928 (Tulane University Number) Published
 every other month by the W B Saunders Company,
 Philadelphia and London Per Clinic Year (6 issues)
 Cloth, \$1600 net, paper, \$1200 net.
- CHILDBIRTH An Outline of Its Essential Features and the Art of Its Management. By WILLIAM GEORGE LEE, AB, MD Octavo of 300 pages Chicago, Illinois, The University of Chicago Press, 1928 Cloth, \$300
- An Elementary Laboratory Guide in General Bacteriology By Harold J Conn Octavo of 165 pages, illustrated Baltimore, The Williams & Wilkins Company, 1927 Cloth, \$300
- Introduction To the History of Science. Volume I From Homer to Omar Khayjam By George Sarton Quarto of 839 pages Baltimore, The Williams & Wilkins Company, 1927 Cloth, \$10 00
- THE PRINCIPLES OF INFANT NUTRITION AND THEIR PRACTICAL APPLICATION By K. H. TALLERMAN, M.C., M.D., and C. K. J. HAMILTON, M.C. Octavo of 183 pages London, William Heinemann, Ltd., 1928 Cloth, 10 shillings, net.
- Conditioned Reflexes An Investigation of the Physiological Activity of the Cerebral Cortex By I P Pavlov, for Mem. R S Translated and edited by G V Annep, MD Octavo of 430 pages London and New York, Oxford University Press, 1927 Cloth, \$900
- THE NEWER KNOWLEDGE OF BACTERIOLOGY AND IMMUN-OLOGY By Eighty-two Contributors Edited by Edwin O Jordan and I S Falk Octavo of 1196 pages, illustrated Chicago, Illinois, The University of Chicago Press, 1928 Cloth, \$1000
- Anthelmintics and Their Uses in Medical and Veterinary Practice. By R. N. Chopra, M.A., M.D., and Asa C. Chandler, M.Sc., Ph.D. Octavo of 291 pages Baltimore, The Williams and Wilkins Company, 1928 Cloth, \$500
- FOOD AND HEALTH An Introduction to the Study of Diet By A. BARBER CALLOW 12mo of 96 pages, illustrated London and New York, Oxford University Press, 1928 Cloth, \$1 00
- Appendicitis. By Thew Wright, AB, MD 12mo of 129 pages, illustrated New York, Allen Ross & Company, 1928 Cloth, \$200
- First Aid and Medical Service in Industry Compiled from a Survey Octavo of 134 pages, illustrated New Brunswick, N J, Johnson & Johnson, 1928
- International Clinics Edited by Henry W Cattell A.M., M.D. Thirty-eighth Series Volume I Octavo of 307 pages, illustrated Philadelphia and London, J. B. Lippincott Company, 1928

moscope of Guilstrand, and slit-lamp illumination and microscopy of the living eye. Whatever one may think as to the all 'round practice of ophthalmoscopy on the part of the general practitioner, it is certain that a reading of this book by him would be extremely profit-

THE QUEEN CHARLOTTE'S PRACTICE OF OBSTETRICS By the following members of the Staff of the Hospital J BRIGHT BANISTER, M.D., and others Octavo of 629 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$700

We have read this book with much interest. Well done, yet different from our American text books, it is notable for two excellent sections,—Abdominal Pains in Pregancy and Pyrexia in the Puerperium. Not withstanding the importance of frequent abdominal examinations, labor is still conducted to the third stage in the left lateral position. Morphin is only exceptionally used in eclampsia. The rectal examination is not mentioned. Tents and manual dilatation are still advocated to overcome "Spasm of the cervix."

The chapter on X Ray in obstetrics is up to the minute. Transperitoneal section is not done, and a strong plea is made for the use of nonabsorbable material like silkworm gut, silk and thread, in the suture of the uterine Caesarean wound

FOOD AND THE PRINCIPLES OF DIETETICS By ROBERT HUTCHINSON, M D 6th Edition Octavo of 610 pages, illustrated. New York, William Wood and Company, 1927 Cloth \$500

This is the sixth edition of a work which first appeared in 1900 and which was based on a course of lectures addressed to the students at The London Hospital The present edition has been modified with regard to protein optimum, vitamines, and principles of infant feeding Other changes are the inclusion of a description of the Sippy Method of feeding in gastric and duodenal ulcer, with some changes in the section on the Dietetic Treatment of Nephritis In this book the references are placed at the foot of each page instead of at the end of the chapter as is so often the case. The print is quite small which makes rather difficult reading, this is undoubtedly due to the author's endeavor to limit his treatise to one volume. A great deal of the text is taken up with the exact chemical composition of the various foods, and these tables, while of importance to the dietitian and laboratory worker, somewhat detract from the practical value of the book to the clinician or the general practitioner of medicine. WHD

An Introductory Course in Ophthalmic Optics By Alfred Cowan MD, Octavo of 262 pages, with 121 illustrations. Philadelphia, F A. Davis Company, 1927 Cloth, \$3.50

The author's aim has been to provide a knowledge of ophthalmic optics that could be practically applied, and this without the introduction of higher mathematics. As such the book will be of considerable use in the ophthalmological field. It is a well written and illustrated work which will be found interesting and clear

DISEASES OF THE SKIN By HENRY H HAZEN A M M D 3rd Edition Octavo of 572 pages, with 248 illustrations. St. Louis, The C. V Mosby Company, 1927 Cloth, \$10.00

This new edition of Hazen's Textbook on Dermatology is in many ways a new book. It covers the field of etiology, pathology, diagnosis and treatment, insofar as these subjects are of value to the general practitioner, not as a book of reference for the dermatologist. Undue elaboration has been avoided.

The book is written in a readable and lucid style, and while strictly accurate and scientific it avoids the use of highly technical terminology. Liberal use of illustrations has been made from the author's collection, and some color photographs are included.

All the most recent aids in treatment are briefly described including the mention of gold thiosulphate in lupus erythematosis, bismuth in syphilis, and the use of unipolar and bipolar desiccation in cancer

A new departure in the classification of skin diseases has been made on the basis of etiology. Eczema has been entirely omitted except for the infantile variety, as Hazen believes "practically all cases of eczema in the adult are examples of dermatophytosis, of anaphylactic dermatitis or of dermatitis venenata."

A book already well known is thus brought up-to-date by this new edition

ARTHUR M PERSKY

A TEXT-BOOK OF PATHOLOGY By FRANCIS DELAFIELD, M.D., and T. MITCHELL PRUDDEN, M.D. 14th Edition Revised by Francis Carter Wood, M.D. Octavo of 1339 pages, with 830 illustrations. New York, William Wood and Company, 1927. Cloth \$1000

This new book is even better than the previous edition by the same author Added to the preceding subject matter are some of the recent developments in the field of pathology. The text is divided into three parts, general pathology, special pathology, and the technique of post mortem examinations. In the introduction the author discusses the chemistry of life, and touches on the various vitamines and the effects produced from their lack or deficiency. The book is written in the usual clear style in which the author is so accustomed to write, and is of great interest. The text contains numerous illustrations by which the reader can visualize the various pathological processes described. There are also many references to more detailed and special works on the subject under discussion. Another good feature of the book is a detailed index which greatly facilitates the finding of any pathological topic in which one may be interested. The book deserves a place among the best books on pathology, and we heartily recommend it to any one who seeks authentic information on the subject. E. H. NIDISH

Diseases of the Mouth By Sterling V Mead, D.D.S. Octavo of 578 pages, with 274 illustrations St. Louis, The C V Mosby Company, 1927 Cloth, \$10.00

This work impresses the reviewer as a volume well written. The medical and dental student will find it a good text book. The extensive bibliography at the end of each chapter will make it a valuable reference book to the general practitioner. The 34 chapters deal with local oral conditions, and systemic diseases, which present oral manifestations. Especially well written is the chapter on Gingivitis.

L. F. Crasson.

Poliomyelitis with Especial Reference to the Treatment. By W Russell MacAusland, M.D Octavo of 402 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$5 50

In this new book Dr MacAusland has provided an interesting, instructive and comprehensive description of Poliomyelitis. It is a volume which constitutes a distinct contribution to the literature of the disease.

The book is divided into two parts, the first of which includes eight chapters dealing with the epidemiology, etiology, pathology, symptomatology, classification, diagnosis and prognosis while the second portion is devoted to the treatment of the disease especially from the orthopaedic standpoint.

In preparing this modern treatise the author has studiously applied himself to the task of reviewing the tremendous number of publications made on the subject in the last twenty years, and from this voluminous material he has tried to select those that are recognized as having definite value. The book is written in clear, concise style, and the printing, binding and illustrations are well and attractively done. It is a work that may well be consulted not only by the general practitioner, but by the pediatrist and orthopaedist as well

JOSEPH C. REGAN

The reviewer has always been dissatisfied with the far fetched attempts to interpret color fields "Quantitative perimetry" as clucidated by Traquair presents a marked contrast in not only stating definite standards but in pointing out simple rules for interpretation

The book is profusely illustrated by charts which are very understandable and not so perfect (as some in recent articles) as to make one skeptical of their re-The author will probably rearrange some of the charts in the new edition as they do not bear a satisfactory relation to the text-notably in the chapter on the chiasm Reference numbers in the text would

No material has so far been published which presents the arrangement of the fiber bundles as we know them in a clear and complete manner. Yet an understanding of their arrangement is essential to the interpretation of any field defect. Traquair more nearly supplies this inadequacy than any other The gross anatomical relations might also be more elaborately dealt with particularly as the author has developed these aspects in a number of papers

The reviewer cannot too warmly recommend this work to every ophthalmologist. J N Evans

DISEASES OF THE NOSE, THROAT AND EAR. FOR Practitioners and Students Edited by A LOGAN TURNER, M.D. With the collaboration of J. S. Fraser and 2nd Edition, revised Octavo of 444 pages, with 234 illustrations New York, William Wood and Company, 1927 Cloth, \$6 00

This manual of diseases of the ear, nose and throat, by a group of specialists of the Royal Infirmary of Edinburgh, fulfills the requirements of this type of book splendidly. The subject matter is so inclusive, the scope so comprehensive, and the illustrations so numerous and appropriate, that the result of the authors' efforts

As evidence of the completeness of the work it is to be noted that the applied anatomy of each part is given at the beginning of the chapter in which it is considered. The chapters covering endoscopy are well The chapters on the ear are particularly deserving of favorable comment, and the last chapter which deals with labyrinth is clearly written and easily under-

Although intended for the general practitioner and student, this book makes a valuable ready reference work for the specialist. The authors and their publisher are to be congratulated upon this issue of a text book which it will be difficult to improve upon.

M C. MYERSON

HANDBOOK OF DISEASES OF THE EAR. For the Use of Students and Practitioners By RICHARD LAKE, FR.CS Eng, and E. A. Peters, M.D. 5th Edition 12mo of 310 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$400 Wood and Company, 1927

This volume is devoted solely to Otology, and it is the fifth edition of a similar volume which was originally presented by Richard Lake in 1903 The book is intended for the use of students and practitioners prefaced by four plates which accurately picture the varied acute and chronic pathology of the tympanic membrane and middle ear cavities

There are chapters which describe the anatomy and physiology of the ear in addition to the functional examination of the cochlea, semi-circular canals, and otoliths

The surgery of the mastoid and internal ear is described in a general way Reference is made to the surgical procedures that have been carried out on the internal ear for the relief and cure of tinnitus and vertigo, but which are not practiced frequently

The authors stress the correction of nasal deformities in the therapy of deafness and tinnitus, but such surgery has proven of little value.

It is the belief of the authors that otosclerosis is due to sepsis and that this typical clinical entity follows suppurative and non-suppurative middle ear disease

Short chapters on life assurance and deaf-mutism con clude the volume

An appendix of prescriptions for use in practice will prove helpful B H. ABRAHAMS

An Introduction to Forensic Psychiatry in the Criminal Courts By W Norwood East, MD Octavo of 381 pages New York, William Wood and Company, 1927 Cloth, \$500

This book will be enjoyed by those physicians who are interested in the psychiatric problems of the criminal law. It is written from the standpoint of the English medico-legal expert. But there are enough points of contact in the English and American procedures to make this book of value to the American student.

The author presents his psychiatric discussions in a clear, up-to-date manner, stressing possibly more the alienistic than the psychiatric viewpoint. He is both fair and conservative in his deductions. The book can be highly recommended, in a field where there is a dearth of good books JOHN F W MEAGHER.

THE NORMAL DIET A Simple Statement of the Fundamental Principles of Diet for the Mutual Use of Physicians and Patients By W D Sansum, MS, MD 2nd Edition 12mo of 136 pages St Louis, The C. V Mosby Company, 1927 Cloth, \$150

There is a certain value to diet in sickness as well as in health. All the agencies of health and sickness are pushing dietetic ideas to the front Sansum presents his ideas in this brochure. He has great faith in diets, and finds that fifty percent of the persons coming under his observation are ill because of the elimination of bulky foods from their dietaries. He discusses his methods in the treatment of constipation, acidosis, high blood pressure, and in health. If a person is healthy, he usually eats what he pleases, and only becomes much interested in dietetic ideas when he is ill. It is the reviewer's impression that most persons actually ill from some disease are rather disappointed after trying a great many different types of diets, if they are not made worse by such treatment. The ideal in medical practise is to remove the agencies causing the ill health, and bacteria play a bigger role in the causation of disease than foods. Very often the causative factor 18 unknown, but the end result of the factor is known, and in such cases diets often spare the part affected. Diet is of some value in the treatment of disease, particularly so in diabetes, peptic ulcer, gout, and perhaps a few others, but a great many of the present ideas being promulgated about food rest on an unsound basis J ARTHUR BUCHANAN

OPHTHALMOSCOPY, RETINOSCOPY AND REFRACTION BY W A FISHER, M D 2nd Edition, revised Octavo of 291 pages, with 260 illustrations Philadelphia, F A Davis Company, 1927 Cloth, \$375

Fisher thinks that ophthalmoscopy and refraction work belong properly in the field of general practice and that it is easily possible for practitioners other than specialists to acquire all necessary knowledge. There are 24 colored fundus plates with duplicates to be used with the schematic eye. Each plate is briefly described and prognosis and treatment outlined. The visual fields are briefly discussed Glaucoma gets a short chapter Fisher sees no reason why the general practitioner cannot qualify himself to diagnose and treat glaucoma This edition contains a chapter on Newer Methods of Refinement in Ophthalmic Diagnosis by von der Heydt, with accounts of Vogt's red-free light, the binocular ophthal-

MEDICAL PRACTICE ACT OF VIRGINIA

The April Virginia Medical Monthly contains the following editorial description of the Medical Practice Act which has recently passed the State Legislature and goes in force on June seventeenth, 1928—Editor's note

House Bill No 199 known as the Medical Practice Act, which passed both houses of the Legislature by an overwhelming vote and after careful scrutiny by the Attorney General's office was found to be entirely constitutional, was signed by Governor Byrd on March 29, 1928

Virginia now has a medical law which safeguards her citizens from quacks, charlatans and imposters and places the care of their health in the hands of those only who shall have measured fully up to the standards of academic and professional training so essential to combating disease in accordance with the progress of modern science and art.

Some of the salient features of the new law are 1 It applies with equal force not only to the so-called Regulars but to Homeopaths, Osteopaths and Chiropractors, exempting those who follow sectarian practice only from the regular examinations on Practice of Medicine, Materia Medica and Therapeutics, but requiring the registration of a diploma from a recognized School of Medicine, Homeopathy, Osteopathy or Chiropractic, awarded after four regular sessions of eight months each in four different calendar years, preceded by a premedical secondary school and college course equal to that required for the degree of Bachelor or Doctor of Medicine in this State

2 It prohibits the issuance of certificates to any person that has been guilty of unprofessional, dishonest or immoral conduct and authorizes the Board of Medical Examiners to revoke or suspend a certificate for any one of these causes

Unprofessional conduct is defined as being any of the following acts. One who is guilty of any crime involving moral turpitude or of fraud or deceit by which he was admitted to practice, is an habitual drunkard or addict to the use of morphine, opium, cocaine, or other drugs having similar effect, who undertakes or engages by any ways or means whatsover to procure or perform a criminal abortion, prescribing or dispensing morphine, cocaine or other narcotics or alcoholics with intent or knowledge that other than medicinal use will be made thereof or with intent to evade laws relative to sale, use or disposition thereof, advertising of medical business in which improbable or extravagant claims are made or which have a tendency to defraud the public, impose upon the credulous or ignorant or in which mention is made of venereal diseases, disorders of the genito-urinary organs or chronic ailments, the practice of "fee splitting", advertising or professing to treat patients under a system or school of treatment other than that for which he or she holds a certificate, or that he or she can cure or treat diseases by a secret method, procedure, treatment or medicine

The law regards any person as practicing medicine who opens an office for such purpose, announces a readiness to practice medicine in the State, or prescribe for, give surgical assistance, diagnoses or treats, heals, cures or relieves those suffering from injury, deformity or disease of mind or body or advertises to this effect, thus preventing the establishment of commercial physiotherapeutic, pathological or X-ray laboratories conducted by other than the licensed medical practitioner

In addition to the passage of the Medical Practice Act, the pernicious statute which recognized Poropathy and created a school for

training Poropaths was repealed

TUBERCULOSIS VACCINE IN BABIES

An editorial in the April issue of the New Orleans Medical and Surgical Journal announces the appointment of a special committee of the Louisiana State Medical Society to investigate the Calmette vaccine which is intended to induce immunity to tuberculosis in babies. The nature of the vaccine is set forth in an article by Dr. A. Calmette which was translated and

read on February 7, before the Orleans Parish Medical Society The vaccine is made from the Bacillus Calmette-Guerin (BCG) This organism is used to produce a culture which "constitutes a truly attenuated vaccine in the sense of Pasteur, that is to say a living culture, capable of cultivation in indefinite series, in

(Continued on page 692, adv xvi)

(Continued from page 692-adv xv1)

with a little thought we begin to realize that the proprietor of such an establishment is assuming a responsibility of great moment and importance

The rôle of nurses in the practice of medicine has before now been discussed in these pages Diagnosis, treatment and operations seem to be within their means and capabilities and there has been no dissenting voice

What is the use of medical examinations and registration if a non-professional person can make diagnosis, give advice, present the patient with medicine, and tell him when to come to the office next? Yet this is exactly what industrial and other nurses are doing daily. What availeth the restraints of medical ethics when a nurse or technician can advertise in the newspapers and bring his talents before the public. Of what use is a medical education when a charlatan can put Dr on his sign and claim a knowledge of osteology when he does not even know the names of the bones, much less their topography and functions?

The Remedy—That is not the function of this article or of this Journal, but it may well be said that if there is a law it should be invoked and offenders restrained and punished and if there is no law there should be Each year the non-professional practitioners become more and more brazen and flagrant, their propaganda more active, their practises more victous, their victims more numerous. The popular intelligence is being lowered, its judgment debased. Whoever is responsible for this state of things should be invoked and the medical profession should be active in seeing that the law is obeyed and that there is suitable legislation to meet the situation

COUNTY SOCIETY FINANCES

Dr Olin West, Secretary and General Manager of the American Medical Association, addressing the Wisconsin Secretaries' Conference in Milwaukee, in January, outlined a unique activity of a county medical society in Kansas, by which the finances of the society were assured The plan is described in the following article in the April Bulletin of the American Medical Association

"There is a county medical society in Kansas, or possibly in another state, that finances all of its work through what appeals to me as being the simplest and most practical and most beneficial plan for everybody concerned. That society agrees to provide medical care, including such surgery as is necessary that can be done locally, for the indigent poor of the county. There is not a county in the United States to my knowledge that does not have to provide for the medical care of a certain number of its own indigent citizens. Every board of county commissioners

A Sure Source of Vitamins A and D

Tested for Your Protection

Clinical evidence has demonstrated the high vitamin potency of Patch's Flavored Cod Liver Oil. It has received nation wide professional endorsement. But that is not enough! We must test every lot of oil made in our plants to guarantee its vitamin potency

Vitamin A Guarantee

The least amount of cod liver oil required daily to promote a renewal of growth in albino rats that have ceased to grow and may show symptoms of mainutrition, such as xerophthalmia on diets adequate except for vitamin A is considered as one vitamin A unit. We guarantee more than 500 vitamin A units per gram

Vitamin D (Antirachitic) Guarantee

The Antirachitic or vitamin D potency of this oil is determined by a modification of the method described by McCollum Simmonds, Shipley and Park. The least amount of cod liver oil required daily during a period of eight days to promote recalcification in the tibia of young albino rats suffering from experimental rickets is considered as one vitamin D unit. We guarantee more than 75 vitamin D units per gram.

While the quantity and quality of available sunlight may or may not be adequate to meet the needs of grow ing children here is a sure source of vitamin potency

proper artificial media and in living organism without either losing or modifying its hereditary fixed characteristics, capable of serving as an antigen in vitro and in vivo, capable of provoking in vivo, the formation of antibodies, definitely deprived of all tendency to produce virulent tuberculous lesions, and remoculable upon sensitive animals

"This impregnation of the lymphatic organs is more effectually realized in causing the newborn to absorb the vaccine by the buccal route, in three doses at 48 hour intervals. A convenient quantity of a recently prepared bacterial emulsion is thus administered which contains in consequence the largest possible numbers of living bacterial elements The absorption is effected easily during the first ten days which follow birth because, during this period of life the intestine of the young infant is paved with proplasmic cells of which the These cells phagocytic power is intense gorged with microbes pass in the lymphatic circulation into the ganglia, the spleen and the bone-marrow These cells carry there and circulate there the vaccine bacilli without power of digesting them These vaccine bacilli are moffensive parasites and producers of antigenic substances whose secretion continues to determine the elaboration of defensive substances (agglutinins, etc)"

Dr Calmette describes his observations following the vaccination of over five thousand children whose subsequent histories were followed. The figures seem to show a reduction in the tuberculosis death rate among the vaccinated children, although the death rates were low among unvaccinated children.

The use of living germs in New York State for vaccinations is under the rigid control of the New York State Department of Health, and general practitioners of medicine will do well to await the judgment of the Department

WHAT IS MEDICAL PRACTICE?

The question of what constitutes medical practice is discussed in the following editorial entitled "Laboratories," in the May issue of the Rhode Island Medical Journal—Editor's note

An interesting newspaper advertisement arrested our attention because of its size and conspicuousness calling attention to the fact that a "Diet Laboratory" could be consulted and estimates of corrective diet, basal metabolism, blood and urine chemistry made and furnished. If this is not the practice of medicine we do not know what it is. The possibilities for good and evil of such an establishment are not at first apparent, but

CHIROPRACTIC LEGISLATION IN CALIFORNIA

California is one of the states that has adopted the principles of the initiative and the referendum in law-making. A proposal has been made to use the principles for securing further recognition of chiropractors. This method was attempted in Ohio last fall but the voters defeated it (see this Journal February 1, 1928, page 177). The May issue of California and Western Medicine discusses the referendum in an editorial from which the following abstracts are taken—Editor's note

We can make note of what a proposed initiative, to be voted on in the state election of November of this year 1928, proposes to enact This initiative would confer by legislation, privileges somewhat analogous to those in the proposed federal bill just considered

This California measure here referred to is an initiative sponsored by the practitioners of the healing art who are known as chiropractors. The chiropractors through one initiative now on the California law books, and which received the sanction of the people of California several years ago, divorced themselves from the state medical examining board. With their own board, in this brief period they have already licensed in California more than 2,300 members to practice their methods of diagnosis and healing.

If the plan of this proposed chiropractic initiative are carried out according to the digest that has come to our attention, it will provide in Section 15d that "Licentiates under this act shall not be discriminated against in favor of other classes of practitioners in the handling of any matters pertaining to the public health"

So here again by initiative act, a group of practitioners whose standards of education are now far below that of nonsectarian practitioners, and which only a few years ago were much more so, would presumably come into possession of full rights and privileges to all public health powers and positions in California. At present such powers and positions are limited to those practitioners of the healing art duly licensed by the state as possessing credentials indicative of adequate preliminary education and professional training

In this proposed initiative these chiropractor practitioners have the temerity to ask the people of the state to grant them through law these grave privileges and responsibilities which it stands to reason, can only be safely acquired through proper preliminary education and adequate professional training. Other sections in the bill of similar nature would be equally detrimental to proper educational and

or every county court, or whatever the governing body of the county, has to provide money for medical care of indigent persons in institutions and outside of institutions

"The county society I have in mind was ap proached by the county commissioners with a proposal that the society would agree to provide all necessary service for the indigent of the county, calls for service having to come through official sources For this the society receives, as I recall the figures, approximately \$2,000 a year It may be more under some conditions Every member in that county society has his dues to the county society and to the state society paid out of that fund Every member is a fellow of the American Medical Association and receives its Journal or one of its special Journals, and none of it costs one cent in actual financial outlay Each agrees that when he is called upon, the calling coming through an official source, he will do his full part in rendering necessary medical service to the indigent poor of the county

"It has been a very easy matter, I am informed, for the officers of that society to apportion this There are no complaints on the part of the members, and the county commissioners are satisfied that the indigent poor of the county are receiving good service, as is shown by the fact that the contract has been renewed from year to

"Now that appeals to me as being a practical There are some places, perhaps, where it could not be put into effect, but I do believe that it has possibilities for rather general application and where it can be applied it will solve the question of financing the county society of average size, will prevent abuses of "medical charity," will equalize certain burdens, and work to the benefit of the community"

(Continued from page 696-adv xx)

editorial on the efficiency of the legislative committee, but unfortunately, it does so at the expense of its neighboring state of Michigan However, the article is worth quoting for its historical value—Editor's note

Advocation of analogous anti-medical legislature in Illinois, in any degree—whether of one bill or of forty bills—would be noticed immediately upon such introduction by scores of medical men, mounting into the hundreds in fact, and measures would be taken immediately to combat this general menace

Illinois State Medical Society has a wideawake legislative committee, aided and abetted in its general alertness against these evils by practically every member of the society Again, it is the personal touch that counts

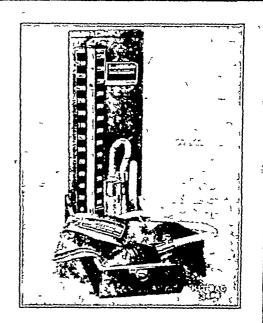

To the bystander at large it would appear as if the State of Michigan were well on its way, far and above any of the other states, to a program of socialized and state medicine. This is due of course to the control of the machinery of the state medical society in Michigan by the state department of health, and the interference by the state university hospital with the prerogatives of the medical profession through the hospital's competitive practice of medicine. This is possible by placing upon the individual taxpayers the burden of partially paying for the necessary overhead met with in caring for the sick and infirm

If this is logic and good economics the scheme should be carried further and result in the taxpayer paying partially for clothes, food, rent and other requisites of patients able to pay

Organized medicine in Illinois functions to prevent just such professional handicaps and legal atrocities as are indicated in this excerpt from an article in *The Bulletin* of the Wayne County (Mich) Medical Society Protection against just such injustice is one of the results of the diligence exerted by the Illinois State Medical Society in behalf of the membership

The need for better representation of the medical profession wherever lawmaking bodies convene, becomes quite obvious when it is noted that during the year just passed, at least eight new laws, each of such a nature as to curtail the activities of the regular medical practitioner, have been enacted by the legislature without the knowledge on the part of the profession, of what they were all about

This situation gives but a faint idea of the effort being exerted toward legislating the profession in one way or another, and it seems high time that medical men take an active hand in the proceedings, lest they be legislated entirely out of the picture

1916---1928

OHIO STATE MEDICAL JOURNAL

A medical journal without a subscription list seldom shows a profit. The Journals of the Medical Societies of the several states show a net cost of approximately one dollar per member. For example, the statement of the Ohio State Medical Journal for April has the following statement of the receipts and expenses of the Journal for the year ending December 31, 1927.

Expenses

Printing	\$11,002 75	
Office salaries	3,727 50	
Rent	1,500 00	
Postage and wrappers	776 04	
Miscellaneous	1,195 48	
		\$18,201 77

Receipts from Advertising 13,082 90

Net cost \$5,118 87

The Society allocates the sum of \$5,000 to the circulation fund of the *Journal*, thereby nearly balancing the books

- MAJOR AIMS OF THE ARKANSAS - MEDICAL SOCIETY

The April issue of the Journal of the Arkansas Medical Society contains an editorial signed by the President of the Society, Dr Henry Thibault, on the aims of the society as set forth in the following extracts—Editor's note

There are two duties of great importance now confronting the Arkansas Medical Society First, the passage of a basic science law, requiring all applicants for license to practice any form of treatment of disease in human beings to pass a creditable examination in the basic sciences before going before the medical board representing the "school of practice" from which he has graduated

Second The perfection of plans and means for the early completion of a State General Hospital, to be used for the benefit of the indigent sick of the State for the teaching of clinical medicine to the students in the Medical School of the Arkansas University

No one can deny that any one ignorant of the basic sciences, biology, chemistry, toxicology, human anatomy, physiology, bacteriology, histology and pathology, is unfit to practice medicine, no matter by what name he calls it or what school of practice he intends to follow

After an applicant has passed these fundamental branches he will be free to go before the board representing his school of practice and will not be questioned on methods of practice by men not of his school. Under this act all practitioners will be on the same footing, and if the basic science board is a non-medical one,

THE MEDICAL SOCIETY IN CIVIC

An editorial in the April issue of the Illiman Medical Journal describes the action of a South Chicago Branch of the Chicago M. Society in successfully opposing the allies ment of an obstetrical clinic whose med promoter put forth the following claims writing, although he is the head of a warning known hospital in Chicago

"We send a doctor, a student and a nurse the woman's home to take care of her, and have developed a method which prevents child bed fever and sore eyes in the baby and guarantees a quick recovery from the confinement.

The promotors of the dispensary had the physicians of Chicago, but had asked support of the South Chicago Chamber Commerce, of which many physicians we members They had the confidence of the summer of the Chamber, and won their put of excluding the institution on the double grounds that South Chicago was not a pauper section and that the guarantees of the promoters were preposterous. The Journal commenting on the situation says

"An illuminating example of the potency that the doctor can have in public affairs is illustrated by the present free dispensary situation in South Chicago Because a number of physicians in the South Chicago branch of the Chicago Medical Society are alert enough to know what is going on in the community and happen to be members of the South Chicago Chamber of Commerce, that section of the city has been saved from a shamelessly marauding invasion by socialized medicine

"The result is not only a great beneficence to the public health and welfare but one of the most brilliant pieces of community cooperation between the physician and the general public that has been reported. For the sake of the example that may be set to other communities and other members of the medical profession, it is interesting to recount what can be accomplished when members of the medical profession everywhere keep alive to the situation now almost universally confronting the profession and the sick

"The physicians of South Chicago should be congratulated on the efficiency in every branch of public service that their community receives It is recommended again that their example be followed by medical societies everywhere"

(Continued from page 700-adv xxiv)

he debate of any kind on any professional matter that faddists may undertake to make subject of controversy. A physician challenged to public debate, if he thinks the challenge worthy of any notice whatever, should bring the matter to the attention of his medical society and abide by its judgment. If the society determines that the proposed debate is expedient and wise and selects him as the one best able to represent professional medicine in the debate, he will appear on the debating platform with the prestige and backing of the organization and not as a possible seeker after publicity, if the society deems some one else more capable of representing the medical profession, he will escape what to the average physician must be a disagreeable duty matter whom the society selects, if it deems a debate proper, the society will look after the de-tails of the arrangements and thus leave the de-Later opportunity to concentrate on the collection and preparation of material for the debate, which is a sufficient task to occupy fully the time of the average physician

Unless a debate on any subject can be held under fair conditions, with definitions binding on the debaters so that words and phrases mean the same thing by whoever used, and with proper safeguards against packed audiences, it had better not be heid, for under any other conditions a fair debate is not within the range even of remote possibility. The most that is likely to be accomplished by debates with faddists is to give prominence to the vaporings of a few faith healers, antivivisectionists, antivaccinationists or other cultists who are eager to bring before the public the cause they represent—and themselves

MAT.PRACTICE PREVENTION

The Wisconsin Medical Journal of May discusses malpractice prevention in the following editorial

"The patient insisted on leaving the hospital against my advice"

"He would not go to town for an X-ray picture"

These are two fairly common defences in malpractice actions that are sometimes unsustained because they are offered on the unsupported evidence of the physician defendant. Because it is not uncommon for the accident case to want to leave the hospital as soon as some superficial injury is dressed even though a more serious injury is a possibility, because it sometimes happens that those living in rural communities believe a fracture can be properly set, or a suspected fracture or dislocation correctly diagnosed, or a suspected foreign body correctly diagnosed without the additional expense of X-ray plates, the Coun-

no one can feel that he is in any way ham

pered by prejudice

Country doctors are seeing every day the great need for a centrally located charity hos' They can give their services free to their destitute patients and then see many of them die for the want of proper housing, proper food and competent nursing No mat ter how willing and charitable the doctor, it is humanly impossible for him to furnish all these Thousands of these patients have been cold, hungry and miserable and many of them have died in their misery, who could have been saved to become useful citizens of the State if we had had a good State General Hos This waste of life and of clinical material is a great loss to the State and is jeopardizing the very existence of our Medical School

Every County Medical Society is urged to hold public meetings and point out to the general public the urgent need of a State General Hospital

DEBATING WITH CULTISTS

A physician is sometimes tempted to engage in a controversy with a cultist, by either newspaper story or public debate. The reasons why he should not argue with the cultist are set forth in the following article in the April Bulletin of the American Medical Association - Editor's note

A physician who is challenged to public debate with a faith healer, an antivivisectionist, an antivaccinationist or any similar antagonist should frankly recognize the dangers and unprofitableness of such debates. If he accepts the challenge, he may be mistaken by his professional associates and others for a seeker after cheap notoriety He will probably find himelf a butt for the ridicule of the faddists and cranks who usually make up the major part of the audiences that attend such The atmosphere of the debate will not be favorable to convincing even one who has an open mind, and, if by chance any confirmed faddist or crank in the audience is susceptible to reason, the crowd psychology of the partisan gathering will tend strongly to prevent his chang-Finally, newspaper reports will ing his mind add nothing to the dignity and standing of the professional debater and as likely as not will be of no service to the cause of scientific medicine They will probably describe the occasion as a mere travesty of truth seeking, which will usually be not far from correct

No physician without the specific backing of his medical society for the particular debate in which he is to engage should enter into a pub-

HEALTH EXAMINATIONS AT A STATE MEETING

The Medical Association of Georgia, which meets on May ninth in Savannah, will give a health examination to every member as a part of the program of the meeting. The plan is described in the following editorial in the April issue of the Georgia Journal

"The Committee on Health and Public Instruction, with the co-operation of the Committee on Arrangements, has perfected plans for health examinations of all members and An appointment book will be their families kept at the registration desk so that appointments for these examinations may be made This is necessary in order that the examiners may be prepared to take care of all desiring this service Please fill out the card that will be given you when you register stating the exact time you want to be examined and secure an appointment as soon as possible and thus avoid overcrowding A complete report showing your health grade will be given you when the examination is completed

SERVICE BY PHYSICIANS

Commenting on the annual Reports of the officers of the A M A, the May Journal of the Tennessee State Medical Association says

"The profession of medicine, especially organized medicine, has spent a great deal of its corporate energies, money and time in fostering measures of general public interest. The only thing that justifies the existence of a doctor is service. The thing that justifies the existence of an organized group of doctors is service. In fact the only real excuse for the existence of any human individual is service. The type and extent of service that an individual will render will be determined largely by his ability and physical capacity The ability of organized medicine to render service will be impaired to the extent that its organization is impaired. A little more energy might be expended on measures and policies looking to the best interest of the profession doing the public will be the ultimate beneficiary"

(Continued from page 701—adv xxv) cil of the State Society has approved a plan presented by the Secretary to eliminate these contributing factors to malpractice actions

On advertising page of the Wisconsin Medical Journal will be found two forms designed to be helpful to the physician in impressing his patient with the desirability of remaining in the hospital or having certain films taken. Failing that, the duplicate slips offer concrete evidence of the fact that the patient failed to follow reasonable professional advice, in which case he alone must bear the responsibility for any untoward results growing out of such failure

These slips are offered in small pads to our members at a cost price. While letters to the same effect may be equally effective, we commend the slips for their simple wording and impressive effect upon the patient and his family

The slips that are advertised by the State Medical Society of Wisconsin are as follows

X-Ray Films Advised

Dr advises his patient, M, that it is necessary, to a proper diagnosis of the case, that X-ray pictures be made, and that, unless X-ray pictures are made, it will not be possible for the physician to be certain of his diagnosis, and he will also, of course, not be held responsible for any consequences of a failure to have X-ray pictures made.

Delivered to the patient and at o'clock, M, 19
In the presence of

м'n

Pad of 50 blanks, postpaid, 25 cents

Hospital Stay Advised

M

You are advised that if you leave the Hospital at this time, you do it against the advice of the doctor, and so, of course, neither the hospital, its physicians, nor your physician will be held responsible for the consequences of your leaving at this time

Delivered to the patient and at o'clock, M, 19

LEGISLATIVE ACTIVITIES IN NEW YORK STATE By W H ROSS, M D, BRENTWOOD, N Y

A Talk at the Secretaries' Conference of the Medical Society of the State of Michigan at Detroit, May 14, 1928

TEW YORK has a long background of medical legislative history, and its consideration is of value Medical legislation, like other things, has often advanced because of what has happened in the past. The records for the last one hundred and twentyfive years frequently show that this has been forgotten The work of the New York State Society illustrates some historical forgetfulness, and some successes due to keeping in mind that which has gone before some of you recall that Dana recently said, "that we get a further view ahead by standing on the shoulders of those who have already done pathway work"

Medical legislative history in New York commences in New Amsterdam on the Island of Manhattan in 1652—two hundred and seventy-six years ago—in an order to regulate the practice of medicine so that quacks and charletans should not have too prominent a place in the community

In 1665—two hundred and sixty-three years ago-a still more serious effort to regulate the practice of surgeons, midwives, and physicians was established and the law said-let me read the quotation—"that no one employed about the bodies of men, women or children for the preservation of life or health should presume to put forth any act contrary to the approved rule of art, or exercise any force or violence toward the body without the advice and consent of such as are skillful in the same art-if such may be had-or at least the consent of the wisest and gravest who were present together with the consent of the patient." It was further stated that the purpose of the law was to direct and encourage those having skill in the right use thereof and to restrain those having presumptuous arrogance and other laws on Manhattan Island overshadow the efforts of recent years and remind us that organized medicine has for long time tried to do something for the proper regulation of the practice of medicine and for com-

munity protection

Then there came a colonial law in 1760 by which the physicians of the province of New York endeavored to secure for its citizens through legislative measures, the results of advancement in medical knowledge and protection against quackery and malpractice This act was the first one in this country that compelled everyone who wanted to practice medicine to be examined and admitted by law, and there was a penalty for violation The province of New York though not at that time the most populous, has priority in establishing an efficient medical practice act though as Dr Beck points out in his Presidential Address of 1842 that more than a century before this act (in fact in 1649) the Colony of Massachusetts "attempted the regulation of medicine and the correction of its medical abuses"

There were some other medical laws immediately before the Revolution and several immediately after the establishment of the state government, but none of them had anything to do with regulating the practice of medicine until 1792 when a time limit of at least two years of study was required in New York City Then there was another enactment covering the whole state of New York in 1797, "that one must have practiced for two years or have studied for two years with a reputable physician and then he could be licensed by the court," and the act of 1792 was repealed All of these laws had to do with better educational requirement for physicians and community protection from disease, just as modern medical practice laws have been characterized by these things

After several years of discussion and the overcoming of both lay and professional opposition, the physicians of New York State were successful in 1806 in having enacted a law creating county medical societies and empowering delegates from them to organize a State Medical Society. The county societies were

given the power of granting or refusing licenses to practice medicine upon examination. Various amendments have been established since that time terminating in the great Medical Practice Act of 1926. The laws of 1806 were revised in 1813 and 1828. Often (and at times every year) efforts were made to lower the requirements for licensing physicians—relatively not unlike the efforts of medical legislative history in the first twenty years of the present century.

Since 1760 in New York Province and then in the State, the ground upon which all medical legislation to regulate the practice of medicine was based was the medical protection of the people, and yet the physicians did not escape the charge of self interest any more than they do today, by many laymen and those trying to be licensed as the result of limited study and knowledge of the human body Nearly every year some remodeling of the law was attempted up to 1843, and the mass of the people made urgent demands for alteration or repeal of the law exactly as they did in New York State for twenty-five years terminating in 1926

In 1842 the Thompsonian physicians sought admission to practice medicine in the same legal way as those entering the profession by law and without examination. They were backed up by the public who perhaps were in revolt because of the heroic methods and dosage common at that time. Anyway the medical profession did not take the public into confidence or try to gain their support at that time as finally they discovered that they had to do and did do in New York in 1926.

It does not appear to have ever been the intention of the legislature to recognize any particular mode or system of medical practice, and the arguments made in 1842 by the medical profession against the admission of the Thompsonian physicians were used against the cults from 1916 to 1926 with the difference that in 1926 the lay support of medical laws was generous The mass of the people who had worked hard supporting the Thompsonian effort succeeded in 1844 in getting a law enacted that allowed any inhabitant of the state to practice medicine without license from the Regents or a County Medical Society or a degree in medicine, except that, when he was permitted to practice without being licensed, he could not charge for his services nor collect by suits in law (The Thompsonian physician, some of you may not know, was one who used only infusions or teas made from roots or barks of plants grown in the United States) Curiously the medical profession to quite an extent supported this legal effort In 1840-1842 several legally organized county medical societies in New York concluded that all prohibitory

enactments were inexpedient, and that the medical society of the state and the medical profession in general were abundantly able to take care of themselves without legislative support, and that in asking for laws from time to time, it was to protect the public and not to gain any advancement in the way of self interest. Many medical men thought that if all restrictions were taken off "so that not having the agitation and the sympathies of the public to feed it," this cult would go down.

This was a time of great excitement, agitation, and revolution in medical laws which continued to about 1850, in some ways like the efforts of the chiropractors to be admitted in 1916 to 1926 though probably more intense. The laws of 1844 removed all restraints to practice, subjecting those practicing only to civil liabilities for malpractice, criminal prosecution for gross ignorance or immoral conduct, allowed them to collect by law for services, leaving all other statutory provisions untouched and rendering them, of course, ineffectual

At about this time there had come to be a very low standard of medical education throughout the country Schools were founded where they were not needed. They were in a state of acute rivalry, competing for students by shortening the course of instruction and making graduation easier.

At the annual meeting of the New York State Society in 1844, Dr N S Davis introduced the resolution that resulted in 1846 in the foundation of the American Medical Association, though the subject had been called up in 1839 by Dr McCall of New York American Medical Association was founded for the primary purpose of raising the standard of medical education in medical schools just as the organization of the New York State Society in 1806 was for the purpose of raising the professional standard among physicians There was decided opposition to this proposal and mostly from medical schools, with perhaps more bitterness and personalities than has ever happened over any other question within the profession

The low standards maintained for the purpose of attracting students and the jealousies of teachers in medical schools show how low all sense of professional dignity had fallen Quoting from the report of the committee of the American Medical Association on medical education in 1852, "the conclusions regarding medical laws were simply to give protection to those measures which are calculated to secure to the community a well educated body of physicians. The medical profession should be a single body of men without any prescribed set of opinions." This fairly characterizes the medical practice act of 1926 in New York

It is interesting to note that there was a penalty for illegal practice in New York from 1683 to 1835 when all penalties were repealed leaving only the provision that an illegal practitioner of medicine coud not recover his debts for service by suits at law

In 1842 leading sections of the state concluded that the only remedy for the deplorable state of the practice of medicine was in medical reform "by which a higher standard of medical education shall be secured" There were many medical schools in those times who licensed those that they knew to be unworthy 1830, eighteen out of twenty-six states had no law regulating the practice of medicine nor laws prohibiting quackery It was thought that the repeal of laws against quacks robbed the quack of his strong-hold on the sympathies of the public Up to 1830, eight states never had any law regulating the practice of medicine, and ten states had abolished all laws pertaining to medical practice. Only four states had existing laws as far as known. In this survey replies were not received from Arkansas, Illinois, Michigan and Delaware

The Thompsonian school had a State Society somewhere near 1850 The State Homeopathic Society was incorporated in 1862 and the Eclectic Medical Society in 1865

There were no further medical laws enacted relating to the practicing of medicine until 1872 when a law was enacted relating to the examination of candidates for the degree of doctor of medicine by the State Board of Regents, and in 1874 it became a misdemeanor to practice medicine in New York except by those authorized to do so by license from the Regents or by diploma

In 1880 a law came into effect that all practitioners had to register in the county clerk's office of the county in which he lived before October first of that year and he had to pay a fee of twenty-five cents. This is known in New York State as the roll call of 1880, and there was not another for forty-six years or until 1926, and now there is one every year.

Can quackery be suppressed by law, or by enlightening the public of its dangers? Public medical opinion in 1844 thought the latter. In 1928 we think by law. Is the highest result to come from a combination?

The Osteopaths were licensed in New York in 1907 under a minimum educational standard with restrictions as to the administration of drugs, giving narcotics, or doing surgery, and the result has been to diminish the number so that today there are about three hundred in the State of New York. They have a state organization

In 1890 the medical practice act of New York was amended so that all graduates in medicine from that time had to be licensed by

examination of the State Board of Medical Examiners and those who had been in practice were licensed by registration of their diplomas

Medical legislative effort in New York was chiefly defensive up to 1916. At that time an attempt was made to amend the medical practice act. It took ten years of work to do it. For years the State was unsuccessful in prosecuting unlicensed practitioners and one of the reasons was that the State had no proper definition of what constituted the practice of medicine. Each year some changes were made in the form of the proposed amendment by both the Department of Education and the State Medical Society in turn until the law was finally enacted in 1926.

Physicians have been largely alone in opposing the exploitation of the public by quacks and charletans. Only in recent years have we endeavored to enlist lay support. For years our legislative activities have been almost confined to the opposition of bills of the cults to the extent of ten or fifteen each year, and it was only in the year 1925 that the profession took steps to offer constructive legislation and adopted means to develop lay support as an aid in enacting its constructive proposals for amending the medical practice act.

In 1925 the House of Delegates of the New York State Society by resolution appointed a committee of seven eminent physicians selected from different parts of the state, and after four months of study of the need for change, improvement, and amendment in the then existing act, it formulated the Medical Practice Act of 1926 After this the bill was put into legal shape by the Counsel of the Society, then after approval by the Council it was submitted to the Attorney General, the Board of Regents, the State Department of Health, and the State Department of Education for suggestions Then it was submitted to a meeting of the legislative chairmen of the county societies of the state, and in its final form came as near representing the opinion of the profession as any medical measure has ever done legislature and at the hearing before the Governor, it was vigorously opposed by the organized chiropractors and drugless healers on the ground that it represented the medical trust, and would make their practice difficult,-which was true, though the bill does not mention any Much thought was given the bill in its final form in adapting it to the law, the constitution, and the established customs and methods of administration

The Medical Practice Act of 1926 is the best practical measure that could be drawn and passed in our state. Its outstanding features are a clear definition of the practice of medicine, annual registration, a minimum educational requirement, prosecution of violators by

the Attorney General's office, limiting the title "doctor" to licensed physicians, and provision for a grievance committee

Let us consider the grievance committee for a moment It is made up of ten members four from the State Medical Society, two from the State Homeopathic Society, one from the State Osteopathic Society, and three members at large of conspicuous professional standing, all appointed by the State Board of Regents The grievance committee is similar in principle to that of the bar association It has jurisdiction to hear and determine all charges against a physician who is charged with fraud or deceit in the practice of medicine, or who has been convicted of a crime or misdemeanor, or who is a habitual alcoholic or drug addict, or who has become insane, or who has been guilty of untrue or fraudulent advertising or advertising that he can cure or treat disease by a secret method, or who undertakes in any way to perform criminal abortion provides a definite method for the operation of the grievance committee

For many years in New York State following 1806 it was the custom of the Medical Society of the State to meet with the Governor, spend an evening with him at his mansion in order to discuss important medical legislative matters that were pending for that year present Governor essentially revived the cus-He was of great help in enacting the 1926 law because of his interest in public health and the illegal practice of medicine He called a conference of the leaders of the medical profession and the official and voluntary health agencies in 1922, '23, '24, '25 and '26 for the purpose of discussing the advisability of amending the medical practice act so as to establish a better basis for preventing cults which by this time had grown numerous (variously estimated at upward of two thousand five hundred) from becoming entrenched by law, the result of constant yearly effort by the cults to have themselves licensed by the state

The Governor further helped to create favorable public sentiment in his annual messages Let me read a paragraph of 1925 and 1926 "Careful consideration should be given to the protection of the people of the state from unlicensed and unqualified persons practicing The co-operation of the medical medicine profession is an essential factor in the protection of the public health as well as in the care of the sick A very large part of modern public health is urging people to see their physicians before serious and incurable conditions have developed Such effort comes to naught if unqualified persons are allowed to hold themselves out as physicians" This splendid statement to the legislature was of great value in the enactment of this law later in the year

We have in our state a legislative bureau controlled by the legislative committee of the State Society. We have had since 1924 a full time medical executive officer devoting about half of his time to medical legislative matters and the other half to assisting the president, secretary, and chairmen of standing committees.

Prior to 1924 the Medical Society made its contact with the legislature through the committee on legislation. Rarely did physicians appear in support of bills because the Medical Society itself was not introducing much legislation at that time. It was chiefly on the defensive and with more or less justification, for there were some bills to the disadvantage of the physicians. Most prominent among them were the efforts to secure some form of health insurance.

Since 1924, when the Society employed an executive officer, it has differently interested itself in legislative matters The executive officer early in the session, makes the acquaintance of the chairmen of the various committees particularly the committee on public health in both houses Through his work the county societies, through their committees on legislation, are informed of everything that transpires in the legislature He endeavors to convince the members of the legislature that he represents the Medical Society of the State, and that its interests are constructive and its principal concern in advocating or opposing bills is the public good He has directed opposition to bills introduced by cults, by showing their selfish character, that they are not an effort to improve the public good, but rather to secure legally the selfish interest of the organizations or individuals from whom the bills have sprung Representatives of the Depart. ment of Education and the Department of Health and the State Society meet for the discussion of bills in which there is a common interest

One of the baffling conditions prior to the establishment of this custom was to find the several departments advising the legislators differently Not a few times this difference in advice brought about defeat of measures that were worth while The harmony of conference has been of great value and was of signal usefulness in passing the Medical Practice Act of Today the legislator looks upon the Medical Society of the State of New York as interested in the protection of the public equally with the Department of Health or the Department of Education, and we have reason to believe that he takes our interest to be as unselfish as the interests of either of the two state departments In the past two years the important change in our legislative program has been its linking up more closely with voluntary agencies whose object is the promotion of the public good. These bodies represent from five to ten per cent of the public and in activity much more than that. In the future I believe that it will be the policy to try to enlist as representatives of the public and staunch allies of ours in legislative work, such organizations as the State Charities' Aid Association, Parent-Teachers' Association, State Committee on Tuberculosis and Public Health, Federation of Women's Clubs, Chambers of Commerce, and the foundations interested in promoting public health activities in the state

The choosing of legislative committee chairmen by the county societies is of great importance with regard to their personal interest, and willingness and ability to give time enough to keep their own legislators informed -through their family physicians if possibleand to make an effort to get them to see that medical men are working for the public good and not for self interest, that they are trying to give the public better physicians and improve public health practice We have in New York one special state meeting at the capital each year of the county legislative committee chairmen, the legislative committee of the State Society, the Council, and the State Society officers A luncheon is served, railroad fares and necessary hotel bills are paid, and there is a good attendance. We have been fortunate in having a governor in New York in sympathy with the advancement of public health and always willing to confer with the Prominent physicians medical profession have always been willing to work in an advisory way with the legislative committee This lays the foundation for the work that we have done in New York Each year the legislators have become more friendly due probably to physicians taking them into confidence, telling them what we are trying to do, and getting their medical constituents to tell them the same thing at home.

The campaign for the enactment of the medical practice act was greatly helped by co-operation with lay agencies as has been done in the past few years in other places, notably in California, Washington, and Oregon The American Association for Medical Progress, the County Tuberculosis and Public Health committees of the State Charities' Aid Association, and other welfare and civic organizations all became interested and actively supported the proposed medical act The great strength behind this bill was the lay organizations, and the fact that it was sponsored by two great state departments, represented by the Commissioner of Health, and the Commissioner of Education Therefore, the essential factor in the passage of the Medical Practice Act was the demand for its enactment by laymen The work of the doctors formulated the law The great power in passing it came from laymen During the efforts to pass the bill in 1926 legislators often expressed surprise and gratification in the interest in the bill taken by laymen. This was the first year that their constituents had told them of the popular support of the bill, and that it was desired by the medical profession and the thinking public equally.

We have apparently learned some things from history. The failures in the neighborhood of 1830 to 1845 appear to be largely because the public were not with the medical profession. The success of 1926 was largely because the public worked with the medical profession. There was need one hundred and fifty years ago to regulate medical practice and to protect the public from quacks and charletans just as there is today. We are inclined to think that we are doing entirely new things. The fact is that we are inheritors of past accomplishments.

The history of all professions shows that "none become highly useful and not even respectable except under restraint of its own members" If it were not that the fitness and qualification of those who may be entrusted with the cure or prevention of disease is to be determined by those trained in these subjects, then there would be little protection against the tendency of so many to accept the mysterious at the hand of ignorant pretenders. If it takes five years of training to develop a safe practitioner of medicine, then those who are willing to accept the cultist with five months of training cannot secure real medical service any more than under similar circumstances in other fields of human endeavor

To show you how much lay interest was aroused over the Medical Practice Act in New York in 1926, let me quote from one of many editorials in the public press "No illegal physician can use the term 'doctor' have wanted the public to believe that they were physicians and merely of a different Deception was their main stock in trade. As Governor Smith said the term 'doctor' presupposes in the minds of a great many people knowledge of the human body and its The new law prevents the doctor diseases It is a decided gain for public health The medical practice act needed strengthening The legislature and the governor are to be congratulated on their handling of a situation menacing to the people of the state" With frequent statements of this kind we were aided When the bill came to a vote it passed the Senate 35 to 12 and the Assembly 95 to 33 It was said that the chiropractors paid their counsel twenty thousand dollars to try to prevent the passage of the bill

The results of the Medical Practice Act were almost at once to drive many illegal practitioners from the state It is believed by the secretary of the New York State Board of Medical Examiners that the number is about one thousand He says that during 1927 one hundred and three cases were arrested, thirty convicted with fifty-eight cases pending, and seven hundred and twenty-eight cases were investigated Apparently there will be as many or more this year They have been widely distributed among chiropractors, naturopaths. physicians without license, foreign physicians who cannot obtain a license, faith healers, druggists, laymen, herb doctors, naprapaths, bone setters, and licensed practitioners in the lesser fields of optometry and chiropody

At the present time one hundred and twenty-five physiotherapists have been licensed under the law. There is a definite need of this type of technical assistant. The law does not give them permission to give medicine or treat disease except under the direction of a licensed physician. New York University is starting a four year course in physiotherapy in association with the Hospital of Ruptured and Crippled.

Many complaints have come from adjoining states and Canada—ten large cities in this country, four in Canada, and three in South America—relative to the sudden increase in the number of quacks in their territory Apparently this wholesale exodus from New York State is the result of its Medical Practice Act Other states and countries have suffered The only remedy is for other states to enact a similar or equal law

Illegal practitioners naturally seek other places where the laws are less stringent. So far as solving a country-wide problem it is not enough for only New York to enact a medical practice law. All other states must do it also if the problem is to be solved.

The illegal use of the title "doctor" or "Dr" has been almost entirely discontinued in the metropolitan area of New York

During the last century some new cult of some prominence has come into existence about every ten years, and we could look forward probably to about the same occurrence in the future This will be stopped by the new medical practice act with its clear definition of what constitutes the practice of medicine, furnishing an accurate list each year of licensed practitioners, and having an educational requirement as a physician in the knowledge of the human body and its diseases without prescribing any system of therapeutics or forbidding the use of anything that a licensed These requirements doctor deems of value should be efficient for a long, long time

An obvious task of the medical profession is to watch out that the force of the medical practice act is never weakened by the modification or repeal of any of its features. It is certain that attempts will be made in the future, just as unsuccessful ones were made in 1927.

In our ten years of experience in trying to get a medical practice act we learned certain lessons which I have referred to, but they can be summarized in a few words

- 1 It was team work that did it It was not due to the influence of any single person. The influence of each one engaged in it was like a brick in a wall—necessary but no more so than any other one. So long as those in power could look upon the medical profession as physicians, they were listened to, but there was no interest as soon as they became politicians.
- 2 No medical body can accomplish the passing of a medical practice act alone. It is absolutely necessary to have lay support, both organized and individual, to the largest possible extent.
- 3 Such laws must come about as a process of evolution They cannot be enacted at once It took New York several years to discover why it failed and to plan and accomplish its final success

The essential features of how it was done are under these three heads—all else is detail Before closing I want to comment upon the Grievance Committee in action The Grievance Committee is a judicial court of reference and not a prosecuting body. Its functions are to discipline licensed physicians who have violated the medical practice act, and to dispose of complaints against licensed physicians based upon inadequate causes or action Charges against a physician must be drawn by an attorney of letter by the State Attorney General's office Then the charges are qualified by the Board of Regents, and referred to the Grievance Committee The Attorney General's office is then asked for an opinion, and if the case has merit, it is put in the hands of the Attorney General and each side appears by counsel The case is the Board of Regents against the accused practitioner, and not the Medical Society against the accused practi-The Grievance Committee really renders an opinion for the use of the Board of The results are splendid One case resulting in correction, when the inevitable local publicity appears, corrects dozens of It takes only a few scattered cases to spread the news all over the state quasi cases where no convictions are expected, have a deterrent effect because of the necessary investigation by the court of judicial reference The Grievance Committee divides the state

into three districts for its convenience—three men sitting in each. The findings are submitted to the full committee. When decisions ar reached, they are filed with the State Board of Regents

We have a permanent administrative organization for the sole purpose of enforcing the act, differing in this respect from the medical

practice act of any other state.

Perhaps it is of interest to note that in 1927 there were registered seventeen thousand four hundred and thirty physicians, three hundred and thirty-one osteopaths, and one hundred and twenty physiotherapists. The secretary of the New York State Board of Medical Examiners says that he thinks that this represents ninety-five per cent of all those practicing medicine in 1927.

The functioning of the Medical Practice Law of New York State is working out well. It is being very carefully administered with the

idea in view that it is universally applicable to the whole United States When this is proven beyond doubt, it should fill a large place in the future in planning a medical practice act in any other state

Through all these laws for nearly three hundred years to regulate the practice of medicine and correct its abuses, there runs four things -an educational requirement, protection of the public against unqualified men, protection of the community in all medical matters, and These fundamental professional dignity traits are plain in the first medical practice law and in the last one These laws have all originated with physicians Each one came into existence when there was need to correct medical abuses I have no doubt that the physicians of each state in turn as its needs arise, will meet their own problems New York has apparently settled its medical practice problems for a generation or two to come

SOME COMMON CONGENITAL DEFORMITIES AND THEIR ORTHOPEDIC TREATMENT*

By PAUL C COLONNA, MD, NEW YORK, N Y

RTHOPEDIC Surgery deals largely with the prevention and treatment of deformities of the skeletal system. It is a branch of general surgery that was described by Andry in 1741, the word being derived originally from two Greek words, "orthos" and "pais," meaning "to straighten the child" and not from the Latin "pes"

The congenital deformities constitute a smaller proportion than those of acquired origin such as deformities following infantile paralysis, tuberculosis or fractures. However, it is considered of sufficient interest to discuss very briefly the diagnosis and treatment of some of the more common congenital deformities as congenital dislocation of the hip, congenital talipes and congenital torticollis

All congenital deformities are thought to come from one of three causes those in which there are inherent defects in the fertilized ovum, those in which there has been some external force acting upon the fetus, such as abnormal intrauterine pressure or position, and those arising from disease of the fetus itself. The second or mechanical theory is the explanation applied to the majority of congenital deformities of the ex-

*Read before the North Brooklyn Medical Society December 27, 1927

tremities In a consideration of these deformities the prognosis is somewhat different from those of acquired origin, for in the majority of these cases seen the opportunity for restoration of form and function can be safely promised if an efficient type of treatment can be begun early and the after care persistently employed

Congenital Dislocation of the Hip -This deformity is usually unnoticed until the child begins It more frequently involves only one hip and may be detected by a marked sinking of the affected hip at each step if the dislocation is unilateral, the so-called Trendelenburg sign, or by a waddling gait if both sides are dislocated Conclusive diagnosis is made by the X-ray and treatment with plaster of Paris after the reduction is accomplished should be begun as soon as the child can be taught not to soil the plaster The dislocation can usually be reduced by manipulation in cases under four years of age and then plaster spicas to retain the dislocation are worn from six to ten months thereafter being changed whenever soiled or broken During this time weight bearing may be permitted on the affected hip The prospect of success with these cases usually stands in direct relation to the age of the patient. In the older cases the degree of trauma necessary to reduce and retain the dislocation by the closed method hardly justifies attempting it and during the adolescent age an open operation is advisable. The patient is primarily interested in securing a stable hip. During the adolescent age the arthritic changes, which in later life may give rise to severe pain, have not appeared and therefore stability at the hip should be the primary aim of the surgeon. In the older arthritic patients the type of operation employed must depend upon the signs and symptoms presented.

Congenital Tahpes—Congenital talipes equinovarus is a deformity in which the foot is twisted inward and the toes pointed downward. This is the type known as clubfoot and composes about seventy-five per cent of all congenital foot deformities. Occasionally the foot assumes other attitudes such as valgus, varus, calcaneo valgus, etc., but congenital types other than equinovarus are rather infrequent.

The clubfoot or equinovarus deformity is usually recognized at birth and is much more common in males than females. All the component parts of the foot are involved in the deformity. If the treatment is begun early, and that means within the first few weeks of life, the results are usually satisfactory. However, cases in which there is an accompanying spina bifida are not followed by such satisfactory results and in all of these congenital talipes cases a careful examination should be made for other existing anomalies.

The correction of the equinovarus deformity should necessarily be gradual and plaster of Paris seems to be the simplest medium for correcting these feet First the varus deformity should be well over-corrected before beginning to correct the equinus, and not only should the deformity be overcome and corrected but recurrence of the clubfoot is a condition that should be guarded against Instruction should be given to frequently stretch and manipulate these feet into an overcorrected attitude until the patient begins to walk and then the shoes should be raised on the outer border for months thereafter In the older patients all parts of the foot become more resistant and fixed in the deformed attitude and operative procedures are necessary to correct the form The treatment of these older cases of the foot must necessarily be an operation on the skeletal structure of the foot These resistant types are usually preceded by wrenching of the foot to partially correct the deformity before an open operation on the bony structure of the foot is The age of operation in a series of cases investigated and reported several years ago, varied from three to twenty-seven years of age and the type of operation generally employed was a tarsectomy A few weeks after operation the patient should be encouraged to walk with the foot in plaster and this should be worn from six to eight weeks and followed by a proper type of shoe

Congenital Torticollis — This is a painless distortion often called wry-neck and results from a contracture or shortening of one or more of the lateral muscles of the neck usually the sternomastoid There were seen at the Hospital for the Ruptured and Crippled 269 cases in a six year period from 1920 to 1926

The theory of Stromyer that congenital torticollis is caused by rupture of the sternomastoid muscle fibres, followed by a subsequent myositis developing in the hematoma has been rather definitely disproven Whitman points out in his textbook that the rupture of muscles elsewhere is practically never followed by a myositis with contracture, unless there is present an active in-The deformity is usually unilateral, slightly more frequently observed in males and ordinarily noticed within the first few weeks of life It presents a characteristic picture with the head inclined to one side, the chin turned towards the opposite shoulder and the contracted muscle prominent In many of the older cases asymmetry of the face and a moderate scoliosis of the cervical vertebrae may be noticed

In very young infants a methodical stretching of the contracted tissues will correct the deformity but in cases over six months of age an operation is usually required

A subcutaneous tenotomy of the contracted tissues was formerly employed but the method is both dangerous and unsatisfactory dissection and tenotomy of the contracted bands through a two inch incision made just below and parallel to the clavicle is a most simple and satisfactory procedure. Some surgeons advise a more radical method, removing a section of the steromastoid at its mid-portion but this is hardly to be recommended Lange and Putti believe the approach at the origin of the muscle is preferable, in order that the scar may be obliterated by the growth of hair on the scalp Whatever the mode of tenotomy employed, it is essential to divide as far as possible all the limiting bands of muscle and facial sheaths and to hold the head in the over-corrected position for four to six The simplest method is to employ plaster of Paris to hold the head in the desired attitude, which should be just the reverse of the wry-neck deformity On removing the plaster, massage and daily stretching should be employed

Conclusions

- 1 Congenital deformities constitute a large group of cases seen in an orthopedic clinic, the most common being congenital dislocation of the hip, congenital clubfoot and congenital torticollis
- 2 If efficient treatment is instituted early a satisfactory correction can be usually attained
- 3 Over-correction of the deformity and long after care are necessary with these cases

tell the tale.

A SIMPLE BUT EFFICACIOUS TREATMENT FOR MORNING SICKNESS* By D A. CALHOUN, MD, TROY, N Y

■ ORNING sickness is notorious for its disputed Etiology, its diversity of manifestations, and particularly for its resistance to the whole Pharmacopæia of drugs used to control it Some of these, are more or less satisfactory, but the majority are useless, and Superimposed upon this is the unnecessary prevalent attitude of many physicians that the condition is to be expected, and endured by the patient The condition is to be expected, but not necessarily endured The very enduring of it over a period of several weeks, with its detrimental effects both physical and mental are adverse to the very fundamental principles of present day Prenatal Care, to-wit, keeping the patient in the best possible condition both physical and mental during such a trying period in her existence Environment today is rapidly making it more and more of an ordeal

It is said of any undertaking that a poor start goes a long way toward a bad ending Morning Sickness, with its loss of weight and ill nourishment, together with the mental perturbation over a period of several weeks is indeed a poor start. The patient insufficiently recovered from such an ordeal and entering the most difficult and trying period of her existence, to-wit, Labor, is indeed a bad ending Operative Deliveries and Puerperal Morbidity

In 1910, Underhill and Rand, as well as Ewing, showed that in Hyperemesis Gravidarum there is an underlying disturbance of Carbohydrate Metabolism Duncan and Harding next expressed themselves as convinced that in early Toxemia of Pregnancy the dominant factor is a metabolic one due largely to a carbohydrate deficiency Over the same period of time Hoffman, Givins and Titus stated that the carbohydrate deficiency is of two fold origin first-a relative deficiency due to an unexpected demand for Glycogen on the part of the fetus and enlarging uterus, second—an actual deficiency, augmented in the presence of nausea and vomiting from lessened carbohydrate intake

Reasoning from the above, it is logical to replenish the liver with the needed carbohydrate as early as the nausea and vomiting appear in order to forestall, as in the first instance, a relative deficiency due to the unexpected demand on the part of the fetus for Glycogen. The nutritive exchange through the Placenta is almost entirely in the form of glycogen as demonstrated by Slemons with his simultaneous analysis of maternal and fetal blood. Likewise, as in the second instance, to prophylactically prevent an actual deficiency,

augmented by the very presence of nausea and vomiting from lessened carbohydrate intake The actual deficiency, of course, leading to the more serious Pernicious Vomiting

Therapeutics based on the above reasoning replenishing of the decarbohydrated liver is, therefore, the logical procedure The simpler the procedure, provided the results are satisfactory, the more attractive it is to the patient With this in mind I have been using the following method of treatment for cases of Morning Sickness during the past several months In mild cases after the patient is up and about, a cleansing enema of soap suds is given and thoroughly evacuated Following this a retention enema of a five per cent Glucose Solution is given. Eight ounces of the mixture is used and is to be retained throughout the day During the day the patient only takes small quantities of fluid every two hours. A ten per cent solution of Lactose taken in small quantities is advantageous, at this time. At bed time the retention enema is repeated as in the morning One tablet of Luminal Sodium is given at night to insure rest and quiet Since using this simple remedy I have been greatly surprised and highly encouraged at the results obtained Two or three days on this treatment suffices, in practically all cases to cause a complete cessation of all nausea and vomiting If the case, when first seen, is of the more exaggerated type, the patient is kept in bed and a daily cleansing enema given, together with three retention enemas at 8 a m to 12 m and 8 p m The Luminal is given night and morning and no food allowed for twenty-four hours, after which small quantities of fluid nourishment are allowed as in the treatment of the mild cases Of course, each case must be treated individually and according to the conditions found when the patient is first seen

In order to insure no return of the condition, I have found it advisable to continue the daily retention enemas for several days after the nausea and vomiting have ceased

The generally accepted treatment today for cases of Pernicious Vomiting is one of intensive carbohydrate medication—oral, subcutaneous, and intravenous—all based on a Carbohydrate Deficiency as the etiological factor. The manifestations of Morning Sickness are similar to those of Pernicious Vomiting although to a very mild degree. Therefore, if the carbohydrate deficiency is supplied at this early period with the above favorable results, not only is the etiology of Pernicious Vomiting one of Glycogen Deficiency but that of Morning Sickness is of the same origin and should be treated exclusively as such

DIET IN HEART DISEASE—THE ROLE OF HIGH CARBOHYDRATE FEEDING* By ALBERT S HYMAN, MD, NEW YORK, and MAURICE PROTAS, MD, WASHINGTON, D C

N spite of the tremendous advance made in the understanding and therapy of the cardiovascular-renal disorders during the past decade, it is rather astonishing to note how little attention has apparently been given to the problem of scientific dietary management Standard text books on diseases of the heart devote a relatively insignificant amount of space to what is often the most perplexing phase in the successful treatment of those suffering from the various cardiovascular affections Indeed, the most glittering generalities and evasive statements are the rule and the entire subject is ordinarily dismissed with a rewording of Withering's contribution made in 1785 in which he wrote "that in dropsie from heart failure, water and salt should be abstained from"

The importance of properly selected elements of diet in the favorable outcome of patients being treated for heart disease, has impressed itself dore and more forcibly upon us, as drug therapy or these cases has become standardized. We are f the opinion that not infrequently the dietary management of decompensated cardiacs may vie with pharmacologic medication in the successful convalescence of such cases, in fact, we believe that many times a favorable outcome has been more the result of proper feeding the individual than in the drug therapy employed. Smith, Gibson and Rosse¹ have recently emphasized this thought

One reason for the apparent failure to appreciate the rôle of food intake in heart disease, may perhaps lie in the diversity of opinion held by many clinicians in regard to the actual value of elected diets in any other condition but diabetes, many physicians, as Vaquez points out, tend to regard most-diets with a suspicion of fadism and content themselves with the elimination of one or more substances from the patient's usual dietary

In the light of recent advances in metabolic studies of cardiovascular disorders, the problem of water and salt intake is found to be no more important than the metabolic balance of carbohydrate, fat, and protein elements of the diet, especially is this so in the non-decompensated types of heart disease

Restriction of fluids and salt has been the routine dietary management in cases of heart failure with more or less evidence of circulatory congestion and edema. In effect, this has ordinarily meant the application of the Karell diet with minor modifications. Warfield, for example, limits the fluid intake of these patients to 746 cc, while Neuhof permits no more than 500 cc per diem. Others like Smith have been more liberal

in their interpretation of Balfour's diets and have included easily digested substances, while Rubow[†] has made a practice of keeping such cases on a very dry diet for weeks and months. Cowan and Ritchie⁸ on the other hand permit a fluid intake as high as 2,000 cc. in twenty-four hours.

Inasmuch as a weakened heart demands more nourishment than a healthy one, in cardiac failure an attempt must be made to insure an adequate caloric intake. The problem is complicated by the fact that in most cardiovascular affections digestive disturbances are not uncommonly found and the symptoms of the embarrassed heart may be intensified by abdominal distension and flatulence

In our experience, none of the modifications of the Karell diet have offered the caloric intake necessary to maintain metabolic requirements. In addition, many patients are unable to digest the milk component of the diet without considerable gastric distress. Peabody, Wentworth, and Barker. have shown that the basal metabolic rates are usually increased in cases of marked cardiac failure, Lev and Hamburger. have noted that in 75% of their series of decompensated cardiacs there was an average increase in the metabolic rate to 39% above normal. Du Bois. found an increase to 40% above normal in severe heart failure.

With these facts in mind, we have believed that there should be an increase rather than a diminution in the caloric intake of such cardiacs. Of the three elementary foodstuffs, the carbohydrates are unquestionably the most important, in the nourishment of the failing heart 12, 18. The frequent accompaniment of renal involvement prevents any great addition of protein substances, Altinow 14 believes that the protein intake must at first be limited to 28 gms, with a gradual increase to 60 gms as the patient convalences. On the other hand, Warfield advises against the addition of fats 4

The use of high carbohydrate diets in the treatment of cardiovascular-renal disorders was probably first advocated by Goulston in 1911, subsequently Pfalz in and Budingen in injected glucose solutions intravenously in marked decompensation with many favorable results. Cheisnisse is reviewing the work of Ettriquez and Gutman done in 1913 used strongly hypertonic sugar solutions intravenously, he believed that such solutions were supplementary even to digitalis in heart failure, his opinion being that a condition of cardiodystrophy occurred from an inadequate sugar content of the blood

While theoretically sound, the problem of increasing the carbohydrate intake in cardiovascular disorders has met the serious objections raised by O'Hare's experiments 19 in which glucose toler-

^{*} From the Witkin Foundation for the Study and Prevention of Heart Disease, Beth David Hospital, New York

ance tests were performed in 23 cases of chronic vascular hypertension with a conclusion that such cases are potential diabetics and nephritics. It has also been pointed out that there is a relatively high incidence of cardiovascular disease among diabetics in whom an hyperglycemia is the rule.

These objections, we believe, can now be more readily understood in the light of recent progress in insulin therapy. In diabetes the excess sugar in the blood fails to be oxidized by the organs of the body and therefor serves no useful purpose in the muscular economy, in non-diabetic heart disease on the other hand, where there is no lack of insulin production, the increased sugar intake is rapidly oxidized and utilized.

Recently, Osato²⁰ has shown in animal experimentation that intravenous injection of dextrose combined with insulin has exerted a very favorable influence upon hearts damaged by bacterial toxins. Edmunds and Cooper²¹ have demonstrated a similar result in depression of the circulatory system with diphtheria toxin. The clinical application of these facts have led us to develop a series of graduated diets with increasing amounts of carbohydrates in the treatment of all cardiovascular-renal disorders.

A study of such patients as they enter any large hospital service has demonstrated that they may be readily grouped into two general classes, those suffering with marked cardiac decompensation and signs of circulatory failure and edema, and those with coronary artery disease or infectious carditis where the problem of water metabolism is relatively unimportant. Such a classification permits dietary treatment to be started promptly

DIET NO 1

Protein 28.9 gm. Fat 18 5 gm Carbohydrate 150 1 gm. Calories 882 0 Total Fluid Intake 800 cc.

Upon arising take 1 glass of cool, not ice cold, water

Break fast

Milk (or Postum with milk)	75 ∞
Oatmeal (or other cereal)	30 gm
Rye (or whole wheat) bread	33 gm
Grapefruit (or orange)	100 gm
Butter	5 gm.

Dinner

50 gm.
100 gm
50 gm.
33 gm.
200 cc.
5 gm

Supper	
Potato, boiled and mashed	100 gm.
Spinach	50 gm.
Cabbage (or cauliflower or sprouts)	100 gm.
Peaches, canned (or pears)	100 gm
Rye (or whole wheat) bread	33 gm.
Tea (or Postum)	200 cc.
At 9 P M, take one-half glass of warm milk.	

*Note. There is no substitute for artichokes, which contain a substance called *inulin*, that is a direct food for the heart muscle.

In the first group of cases with retained fluid, we have found that our Diet No 1 offers many advantages over the Karell diet which is ordinarily used in such conditions. As we have noted before, the milk component of the Karell diet frequently renders the patient's heart action more precarious because of the flatulence and abdominal distension engendered by fermentation. The resulting pressure from the high diaphragm seriously embarrasses the movements of the heart Moreover, as Osborne²² succinctly points out, the continued use of such a diet may be dangerous in that the heart and circulation becomes progressively weaker on its low caloric value.

Diet No 1 contains almost an equivalent amount of protein and fluid intake as that of the Karell diet, there is a reduction in the fat content, however, with a corresponding increase in the carbohydrate components. At the same time, this diet provides for the oral mastication of the food, a factor so often overlooked by those preparing diets for such conditions Mackenzie²³ wrote in his fine practical manner, that in the Karell diet the bread and milk are so prepared that no mastication is needed and the stomach is burdened with the duty of getting rid of the The great importance of oral digestion is not sufficiently appreciated—not only does the process of mastication in several subtle ways stimulate the digestive glands of other organs but the juices from the mouth are so mixed with the food that they not only assist digestion but prevent flatulence which is so often such a troublesome feature in the weakened digestion which accompanies heart failure

Starting with Diet No 1 we have devised six groups, each containing the minimal metabolic requirements of protein equally suitable for cardiac or renal disease, yet meeting with the standards of Altnow 14. The fat content has of necessity been kept low, for as Joslin 24 has shown, in any diet where the carbohydrate is high the fat must be low and vice versa. The carbohydrate components of the diets have been progressively increased but in forms not readily leading to flatulence or gastric disturbance.

In this connection, the work of Root and Barker²⁵ in regard to the mulin content of artichokes is of considerable interest, these authors found experimentally that the ingestion of artichokes insured a slow liberation of glucose in the blood with a rapid utilization. We have included this vegetable in our diets as a valuable source of carbohydrate intake

In the first group of cases consisting of the badly decompensated cardiacs and some coronary occlusions we have used Diets Nos 1, 2, and 3 Diet No 1 consists of protein 28 9 gm, fat 18 5 gm, carbohydrate 150 1 gm, total fluid intake 800 cc, calories 882

Diet No 2 consists of protein 37 7 gm, fat 27.2 gm, carbohydrate 181 1 gm, total fluid intake 1200 cc Caloric value 1120 4

DIET NO 2

Protein 377 gm Fat 272 gm Carbohydrate 1811 gm Total Fluid Intake 1200 cc.

Upon arising take 1 glass of cool, not ice cold, water

Breakfast

Dumer

Artichokes Potato, boiled (or turnip or carrot) Lettuce (or other greens) Rye (or whole wheat) bread	50 gm 100 gm 50 gm
Rye (or whole wheat) bread Tea (or Postum)	50 gm 200 cc
Butter	10 gm

Supper

Potato, boiled and mashed Spinach (or other greens) Cabbage (or cauliflower or sprouts) Peaches, canned (or pears) Rye (or whole wheat) bread	•-	100 gm, 50 gm 100 gm 100 gm 50 gm
Postum		200 cc.

At 9 P M take two-thirds of a glass of warm milk During the day, 2 additional glasses of water should be taken

This diet has been used in those cases of returning compensation which have been on Diet No 1 for three or four days An attempt is made to raise the caloric intake as rapidly as possible, for while 1,000 calories per diem have been shown to meet the basal metabolic requirements of the ordinary bed patient, the increased metabolic rate in heart disease demands at least 25% more

DIET NO 3

Protein 44 3 gm Fat 37.5 gm Carbohydrate 213 5 gm Calories 1368 7

Upon arising take 1 glass of cool, not ice cold, water

During the day drink 2 to 3 glasses of water	J

In practice we have adopted the procedure of utilizing Diets No 1 and 2 for hospitalized cardiacs, increasing to Diets No 3 and 4 during convalescence. The patient is usually discharged with Diet No 5 or 6 Every patient upon admission to the hospital has a preliminary urinalysis to determine the presence or absence of sugar, for this entire system of high carbohydrate feeding is, of course, contra indicated in the presence even of suspected diabetes. A subsequent blood sugar is made to confirm the urinary findings and to discover cases where the sugar threshold is high

SUMMARY

1 Although many writers discuss the importance of dietary regime in the treatment of cardiovascular-renal disorders, the available literature reveals no specific outlines for the practical feeding of such patients. In general only casual and obscure references to a *dry diet* and one which is easily digested are made

2 Because of its simplicity the Karell milk diet has claimed the attention of most authors, particularly in the treatment of the badly decompensated cardiacs. It is noted, however, that the milk component of the diet is not well tolerated by many patients, abdominal distension, flatulence, and other gastric disturbances may develop and may lead to further embarrassment of an already weakened myocardium. In addition, the low caloric values of the Karell diet and its modifications tend to increase the undernourishment of the previously starved heart.

3 The increased metabolic rate which has been found to occur in decompensated heart disease is not met by the ordinary Karell diet, other substances must be added to raise the caloric intake necessary to maintain sufficient nourishment of

the body

4 Experimental and clinical evidence tend to indicate that the weakened and undernourished myocardium is greatly benefited by carbohydrate ingestion. In fact, intravenous injection of glucose has shown remarkable curative effects in advanced cases where even digitalis has failed to act.

5 The former objections to high carbohydrate feeding for the relief of cardiac decompensation were raised because of the discovery of the relatively high incidence of cardiovascular disease among the diabetics, in this latter condition, however, the use of insulin has shown that the hyperglycaemia is the result of dysfunction in the oxidizing processes in this disease and for this reason the increased sugar content in the blood is of no benefit to the myocardium

6 The intravenous use of glucose combined with insulin is suggested in the seriously decompensated heart. Where, however, the food are be taken by mouth, a carbohydrate intake can be provided to meet the patient's metabolic require-

ments

7 For this purpose, a series of diets have been devised which contain relatively low amounts of fats and protein but with increasing amounts of carbohydrates. The carbohydrates are given in the forms least likely to produce flatulence and gastric distress. The inulin content of artichokes is recommended for its almost specific effect upon the undernourished myocardium. The protein levels have been kept well within the limits demanded by Du Bois, Chittenden, and Altnow These diets are thus equally suitable for patients suffering from acute renal disease.

8 Six standardized diets have been prepared utilizing foods based upon the principles outlined above, the first three are suitable for hospitalized or bed patients, the latter three for convalescent and ambulatory cases

PITUITARY EXTRACT IN PYELITIS

By JULIUS A. MILLER, MD, NEW YORK, N Y.

HE treatment of pyelitis has up to the present time proven quite unsatisfactory, because of the fact that in all cases apparently cured there have been frequent and annoying recurrences of the condition

In studying my records of a number of obstetrical cases complicated by pyelitis in the past ten years, I have noticed a surprising fact, where pituitary extract was used pyelitis never occurred or recurred as a postpartum condition, whereas prior to its use the complication cropped up with annoying frequency

This led to further study and experimentation, the result of which I wish to present for corroboration

Treatment of pyelitis has heretofore consisted of varying attempts to neutralize the acidity of the urine and to cause the urine to become germicidal or antiseptic. Rest in bed, alkiline treatment coupled with hexamethylenamine and tincture of hyoscyamus have been the more common procedures resorted to

In mild cases these treatments appeared to be successful and the course of the disease arrested. However after the lapse of short periods of time the conditions recur and the recurrences are usually frequent and of increasing severity. Protraction of the symptoms of the disease after the most intelligent

and persistent treatment often proves very disheartening to both physician and patient

If, therefore, the treatments which I suggest should prove to be substantiated by the experiences of other members of the medical profession a great step will have been taken toward eliminating this common complication in the parturient woman

I have noted that pyelitis occurs more frequently in the latter months of pregnancy Primipara are more commonly afflicted than multipara Pressure is usually one of the chief causative factors

With pressure applied directly or indirectly on the ureter a condition of dilation above the point of pressure is certain to result. There is therefore a retention of urine in the dilated portion and soon the retained urine decomposes and the ureter and the pelvis of the kidney is invaded by intestinal bacteria. The result is always a pyelitis

The ureter from long dilation, becomes atonic at the artificially created bulbous portion so that even after the removal of the pressure postpartum, its contractility is impaired. There is also of necessity a complementary shrinkage in the lumen of the ureter in the lower portion with a further reduction in kidney drainage.

That is why pyelitis often persists long after delivery and recurs even after the involved areas have been rendered aseptic It is known that pituitary extract causes an increase in the contracting power of the involuntary muscle tissue. It is therefore apparent that its use has the effect of restoring the tone of the ureter and so increasing the contractility and preventing stasis of the urine and the resultant infection of the genito-urinary tract

These facts explain the following results which I obtained through the use of pituitary extract in the parturient woman as shown in

the accompanying tables

First, as I stated above, where pituitary extract was used, pyelitis did not occur as a postpartum complication.

Second, where pyelitis existed before delivery, the use of pituitary for inducing labor, or as routine postpartum, effected an immediate and almost miraculous cure (This fact previously proved very puzzling to me, but in the light of the facts stated above it is logical and simple)

The fact that all other conditions of the antipartum, labor and postpartum treatment remained the same (except for minor differences in the use of anaesthetics and analgesics) both in those cases where I used the pituitary extract and those where I had not used it led me to feel that I had a proper control group in the latter with which I could compare my results in the former. It seemed an inevitable conclusion, therefore, that the improved results were due entirely to the use of pituitary extract.

The next step was to test the results in using pituitary extract with old standing cases of pyelitis which had reacted only temporarily to the former methods of treatment

Nine old cases of recurrent pyelitis were given three injections of 1cc of pituitary extract at intervals of five days. Urinalysis was made weekly, and the cases carefully watched

Several months have elapsed since this treatment was given and the pyelitis has not recurred thus far in any of the nine cases. Whether this present cure is permanent remains to be seen. However the uniformity of the results and the length of time elapsed without recurrence lead me to feel that pituitary extract can be used in such cases with fair assurance of a permanent cure in many cases.

It remains also to be seen whether similar treatment can be given in the latter months of pregnancy without incurring the dangers of induced premature labor

I would suggest that treatment along these lines be tried also by pediatricians in the cases of pyelitis of infancy

THE ASSOCIATION OF DISEASES*

By HAROLD THOMAS HYMAN, M D, and LEO KESSEL, M D, NEW YORK, N Y

HE synchronous association of more than one pathological process may give rise to both diagnostic and therapeutic difficulties. It is a general practice to attempt to explain all the symptoms and signs on the basis of a single disturbance. The purpose of this report is to call attention to exceptions to this rule.

The simplest examples of a misleading association are illustrated by the following case histories

No 269 An old man with cardio-nephritic degeneration complained constantly of vague abdominal pains. The vague pains were thought to be due to tympanites or the result of the chronic passive congestion of the liver X-ray showed calculi in the kidney (Plate I) No A man with cardio-nephritic change developed acute abdominal pain. It was originally thought that the patient probably had an infarction associated with the original disease X-ray film made some days later however, showed a ureteral stone which the man later passed after another paroxysm of pain No 210 A man of sixty-one had had a nephrotomy for stones and later developed lower lumbar pain It was a natural inference that the back pain was also associated with a disturbance in the genito-urinary tract Careful examination, however, the relief from strapping and posture soon made it apparent that the difficulty was skeletal, and cystoscopy absolved the genito-urinary tract

An extremely common association, the examples of which might be continued indefinitely occurs in the patient who has a psychoneurosis and who actually develops real pathology For example, a woman (No 23) had had a profound psychoneurosis for six years with subjective manifestations of all sorts and all degrees of intensity While under observation she developed upper abdominal pain which was found to be caused by a real cholecystitis X-ray of the gallbladder region after the injection of kerasol revealed a moth-eaten organ with negative shadows that strongly suggested concretion Unquestionably this condition had nothing to do with the previous complaints Because of the usual absence of physical findings on previous occasions, the abdominal pain was at first minimized, and there was a distinct tendency to slide over the possibility that she might have an organic disorder Such errors are common and they illustrate the necessity of realizing that patients who suffer from psychoneurosis or other functional disorders may, as well as anyone else, develop true organic disease On the other hand, the presence of truly hysterical symptoms may complicate the clinical picture resulting from true organic disease, as occurred in a woman of forty-one (No

45), who complained of pain in the right upper quadrant and retention of urine. Until it was realized that the retention of urine was hysterical, all our attention was directed at the genito-urinary tract. When we learned that the retention of urine always accompanied any disorder of any type, we investigated anew, and established a diagnosis of cholecystitis and cholelithiasis both from the clinical examination and from the appearance of the film of the gallbladder region taken after the injection of kerasol

When an actute infection is superimposed upon a latent chronic disease, error is hable to occur from the interpretation of all of the physical findings as the result of the acute infectious disease. It is often impossible to estimate the age of the findings. Thus in patient No. 59 and

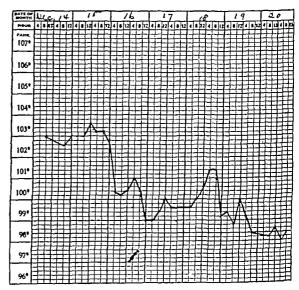

Fig 1 Temperature chart of patient No 59, a girl of fifteen

again in No 207, we were dealing with children who had old defects of the mitral valve which had never been suspected In the first instance, a girl of fifteen with fever and a cardiac murmur, it was the first suspicion that the fever was related to the cardiac condition and that we were dealing with an active endocarditis The course of the disease, however, made it apparent that the girl had a pyelitis, and that the valvular defect was an ancient affair and unrelated to the acute infection In the second instance, a boy of fourteen who similarly had fever and evidences of mitral defect, the infection was not an endocarditis, as was at first suspected, but a bronchopneumonia, occurring in a boy who happened to have a stenosis of his valve other example of a similar difficulty arose in

^{*}From the Medical Service of the Mount Sina: Hospital

patient No 33, who had a purulent pan-sinusitis, and entered the hospital with fever, headache and swelling of the eyes. The constitutional symptoms were thought, to be due to the sinus infection until the blood count was made and an eosinophilia of forty per cent was found. The history of the course of the disease made it perfectly clear that we were dealing with trichiniasis in a woman who had a pansinus infection. It was impossible to obtain a specimen from her muscle, but the clinical diagnosis was quite clear to the general satisfaction.

In the course of the last two years during which we were engaged in the study of lobar pneumonia,1 we have seen three examples of the coincidental presence of lobar pneumonia and an acute cholecystitis In the first instance, case No 16, a pneumococcus peritonitis was suspected, but abdominal puncture showed no fluid second instance, No 30, an actual hydrops of the gallbladder made the diagnosis more obvious, and in the third instance, No 95, the clinical picture was extremely clear. None of these women had ever had symptoms relative to their gallbladder before, nor have they had since, and we are inclined to believe that there is perhaps some etiological relationship between the pneumonia and the cholecystitis The frequent occurrence of a physiological jaundice and of abdominal pain from other sources such as distension and pleuritis makes the diagnosis of a concurrent cholecystitis in pneumonia fraught with many difficulties

Certain associations also seem to occur with a degree of frequency that suggests symbiosis. For example, in a study of two hundred cases of exophthalmic goiter, we have met carcinoma of the stomach in five instances, or two and a half per cent. This is certainly beyond expectation, and the coincidence has been elsewhere commented upon. An example of this association occurred in patient. No 6, who was a woman of forty-six who had had exophthalmic goiter for ten years and whose gastric symptoms dated back four months. Her basal metabolic rate was plus thirty-eight per cent, and she had diffuse carcinomatosis, undoubtedly originating in the stomach.

The association of various types of infection, mishaps and clinical diseases in patients with exophthalmic goiter has been the subject of a previous communication by us 4. These associations are probably due to the lowered resistance and increased susceptibility of a patient, either because the defenses have been drained by the manifestations of the exophthalmic goiter, or because these complications as well as the exophthalmic goiter grow easily in a peculiarly susceptible organism

Where an individual suffers from syphilis, there is great tendency to explain all of the disturbances that may arise on the basis of a spirochetal invasion. However, an individual who has syphilis may suffer from identically the same diseases as the non-syphilitic. At times, however, the diagnostic dilemma may be great, as for example, in patient No 46, who was a woman with cerebro-spinal syphilis and severe attacks of abdominal pain. The first impression was quite naturally that she was suffering from tabetic crises, but more extensive examination made it perfectly clear that she had a cholecystifis with cholelithiasis A similar picture occurred in a woman of fifty-three (No 106) with cerebro-spinal syphilis who developed carcinoma of the stomach A very similar but more complicated picture arose in this woman, thirty-five years old, (No 157), who had syphilis, was undergoing arsenotherapy, and developed an acute cholecystitis with jaundice In this instance, in addition to the diagnostic difficulty that arose from the syphilis, there was the suspicion that the jaundice might have resulted from the therapy The gallgladder, however, was definitely pathological, and the course of the disease made it apparent that it was an acute cholecystitis which happened to occur in a syphilitic woman who was receiving arsenic

Patients with carcinoma are invariably suspected of metastases when they develop pain or disability anywhere, and particularly in bones Thus a man, (No 222), with a carcinoma of the bladder and a duodenal ulcer came to the hospital complaining of pain in the shoulder suspicion was a metastatic growth, but investigation made it quite clear that he had a simple bursitis from which he made a complete recovery An error illustrating the opposite was apparent in patient No 251 who developed pulmonary symptoms seventeen years after the removal of a bladder carcinoma The span of time that had existed between the removal of this neoplasm and the present symptom, made it seem unlikely that there was any relationship The X-ray however, was quite characteristic, and the autopsy showed the presence of metastatic carcinoma of the lung This whole clinical picture occurred in a man who had complete situs invertus

In individuals with tuberculosis just as in individuals with syphilis or malignant disease, one tends to explain everything on the basis of that tuberculosis, particularly if the signs are pulmonary. However, acute pulmonary infection may occur in the tuberculous just as in the non-tuberculous. A man of thirty (No. 54) had a tuberculosis of the left upper lobe and a lobar pneumonia of the right lower lobe. He entered the hospital from symptoms which were obviously related to the fresh pneumonia. He ran the typical course of a lobar pneumonia and made a recovery as far as his pneumonia was concerned. Similarly patient No. 86, a woman of thirty-eight

had a nephrectomy for tuberculosis five years before she developed acute abdominal pain in the right upper quadrant The natural suspicion was a tuberculous involvement of the remaining kidney However, greatly to our surprise and much to our relief, we found a cholelithiasis and a perfectly normal kidney Under expectant treatment, she made an uneventful recovery

Pulmonary accidents may also occur in the tuberculous, as occurred to a boy of nineteen (No 69), who complained of repeated hemo-X-ray and clinical examination showed ptyses a bilateral apical infiltration For no particularly intelligible reason, a bronchoscopy was ordered, and a walnut shell was removed from the left upper bronchus, and it became apparent that the hemoptyses came from this site rather than the old tuberculosis Thirteen months after this bronchoscopy, the boy was re-admitted with a bronchopneumonia of the right lower lobe This ran the course of an acute infection discharged, and when seen later in the follow-up clinic, he was perfectly well, and suffered no ill effects of the tuberculosis

While diagnostic errors may occur as the result of attempts to explain the entire clinical picture on a single basis, the opposite error may occur, as in a woman of twenty-one (No 68), who had had an appendicectomy and a cholecystectomy for the relief of abdominal symptoms before she was seen by us We found an irregularity of the duodenal bulb and believed that her gastric symptoms were probably due to this defect which had been overlooked at the previous Six months later, however, she deoperations veloped a polyarthritis and an erythema nodosum, so that the likelihood was strong that all of the previous diagnoses were probably incorrect, and

the whole syndrome hinged on the visceral manifestations of the erythema group

At times a cause and effect relationship exists between apparently unrelated conditions, and this may be of great therapeutic usefulness Thus, an obese woman of forty-four (No 29), had a chronic cholecystitis associated with auricular fibrillation Previous writers noted this association and possible relationship as evidenced by the fact that the cardiac mechanism at times becomes regular when the gallbladder is removed 5 In this instance, however, the patient refused operation, so that no opportunity was offered for investigating this particular point

Sum mary

Pathological conditions may occur synchronously in the same individual. At times these offer diagnostic difficulties, and while it may be the exception for two diseases to co-exist, at the same time the possibility must be borne in mind if error is to be avoided

THE TREATMENT OF CERTAIN FORMS OF URTICARIA By EUGENE E MARCOVICI, MD, NEW YORK, N Y

URING the past three years I have had the opportunity of seeing a great number of urticaria cases in my office, the symptoms and treatment of which I take the liberty to relate briefly

A group of these cases complained of the appearance of enormous hives on the body for the past two years In this group were mostly female patients, nearly sixty years of age, who gave a history of some food poisoning (fish or meat), with acute gastric conditions, followed by the appearance of a general urticaria, of the gigantic type with all the disturbing symptoms such as itching, insomnia, dizziness, nausea, and lack of appetite

The skin manifestations appeared mostly at night, over the covered parts of the body, or on places which were under a pressure (under a corset or fur collar), and would persist dur-

ing the night and disappear in the morning The eruptions, which were of light pink color, raised over the level of the skin, reached the size of 7 4 cm, varying on some days and appearing as small fields of tiny single spots or involving larger surfaces, the intensity of the general reaction in accordance with the The localization of the skin area involved eruptions would correspond to the course of the nerves

The patients were all underweight and very Dietetic care did not change the conditions, neither did the formerly advised medications, as bromides, physics, and colonic irrigations

All these patients had in common the atonia of the whole colon, the ptosis of the transverse colon, and the 72 hours retention in the cæcum

A rich carbohydrate fat diet would not be

followed by eruptions, while a richer protein diet would, in spite of the usual medication, provoke them. It seemed as if the once suffered protein poisoning had produced a hypersensitiveness to all animal proteins in those patients

The aim of a successful therapy will attempt to improve the elimination of toxins through complete intestinal evacuations, and to reduce the hypersensitiveness of the skin nerves by means of aniesthetic salves, and finally, to improve the general resistance by increasing the state of nutrition

The cases were started with a dosis of calomel (02 to 04 gr) followed by citrate of magnesia. The diet consisted only of milk, boiled, and tea (one quart of milk and two quarts of tea) daily

Every night one tablespoonful of milk of magnesia upon retiring Every other day colonic irrigations with addition of irrigol (one teaspoonful to one quart of water, warm), using about four gallons of water

Three times weekly subcutaneously 10 cc of sterile uriage water (uriage in sterile ampoulles, Fougera Co)

Before dinner a warm bath with bicarbonate of soda (one lb to the bath), for twenty minutes After the bath use the following ointment

Chloral hydrate—50
Aqu calcis
Aqu amygdal amar—aa 150
Lanolini
Vaselini—aa 300
Sig Ointment.

The diet after the two fast days should be lactovegetarian, with the addition of easily digestable proteins (boiled fish or chicken) An example of suitable diet, following the first days of strict diet

Breakfast Tea with boiled milk, sweet butter, toast or zwieback, fresh stewed fruit (apples, pears, peaches, plums), boiled cereals (oatmeal, farina, tapioca, wheatena) with milk and cream

Luncheon Thick soups (cream soups, made of rice, barley, peas, beans, potatoes, oatmeal, celery, etc), boiled fish or chicken, purées of vegetables (spinach, potatoes, carrots, peas, beans, lettuce, beets, turnips, squash, artichokes, asparagus, chestnuts, lentils) Light desserts as puddings, souffles, ice cream, jellies, compotes, sponge cake, lady fingers, etc) Toast or zwieback, vichy water (Celestins)

Dinner Purées of vegetables, milk dishes, stewed fruits, sweet or sour milk, sweet butter, zwieback Drinks light beer, orangeade Carbonated waters and wines, whiskey, prohibited

Among foods which have to be excluded from the diet for a longer period of time are

game, beef, lamb, pork, fat fish, eggs, asparagus

I have seen recurrence of urticaria in one of my cases after lamb, in another, after nuts or sherry wine

An abdominal support was recommended in all cases with a pronounced colon ptosis

Inquiries with all the cases observed are satisfactory, no recurrences since one or two years, although they were cases which had the conditions for many months, some over one year

Intravenous injections of calcium chloride, urotropine, were not successful in acute cases, as anaphylactic reactions on some foods (lobster, crawfish, spoiled fish, or meat) Afenil and Ekzebrol give quick relief (intravenously)

The types I mention in this communication were chronic cases in which the formerly cited therapeutical means seemed to be the most efficient

The suggestion to name these skin eruptions, caused by cæcum stagnation and toxin resorption, cæcum urticaria may prove justified, when further observations on the subject will be more numerous

CONCLUSIONS

While urticaria-like skin eruptions are very frequent and usually easy to correct (when due to acute gastrointestinal conditions—food poisoning, anaphylactic reactions, diseases of the genital tract in the female, anemia, hypoor achlorhydria of the stomach, etc.), there are types of chronic cases described above, due to atoma of the coecum, leading to toxic resorption, and with a pronounced ptosis of the transverse colon.

In the treatment of these coecum urticaria cases, the etiology will have to be considered, and as such internal, causal, and external symptomatic means are to be employed

In urticaria ex in gestis, prompt and efficient evacuation of the intestines by means of a cathartic, especially castor oil or calomel, is desired Easy, digestable diet as mentioned above In chronic cases, Karlsbad water (Mühlbrunnen), and a continuous use of intestinal antiseptics (menthol, salol, ichtyol pills)

In undernourished, weak patients, arsen medication, change of climate, sea baths, light hydrotherapy are successful

In some very persistent urticaria cases blood letting (venae punctio) and following infusion of salt solution is of advantage (taking about 200 cc blood and replace with one pint of warm physiologic salt solution)

Intravenous injections of 50 per cent glucose solutions (10 cc every other day), Afemil (810 injections), ekzebrol, hypodermic solutions of uriage water, are means which enrich our fighting resources against the more resistent urticaria

The itching of the skin we try to control with alcoholic solutions (washing) of salicylic or carbolic acid, menthol, thymol, applying talcum powder afterwards

Among outtments, the ones containing chloral hydrate (according to the prescription mentioned

above), camphor or menthol are the most de-

Artificial sun-light treatment, internal medication of calcium, magnesia, colonic irrigations with irrigol, complete our means of fighting the urticaria forms, described above, successfully

A CRITICAL STUDY OF THE T WAVE IN THE ELECTROCARDIOGRAM By SIMON FRUCHT, MD, BROOKLYN, N Y

THE problem of the T wave has engrossed the attention of many investigators. According to Willius (1922) and Lewis (1925) no adequate explanation for the occurrence of the T wave and its change in experiment and disease, has been given up to the present time. These alterations are very characteristic and their appearance in disease has been found to portend such grave consequences that it was deemed worth while to undertake the following study.

It is common knowledge that the Sinus Node is the pacemaker of the heart beat stimulation has been found to produce an acid condition and an electro-negativity in its immediate vicinity This event ushers in a series of_electrical phenomena resulting in a cardiac The impulse or excitation wave, generated in the Sinus Node, travels radially through the auricular musculature, spreading like oil upon water and causing a contraction of the upper chambers When the excitation wave reaches the junctional tissues between auricle and ventricle, its propagation is taken up by a specialized conduction system, the Bundle of His and its right and left branches These branches transmit the stimulus through their fine arborizations to the ventricular musculature, the impulse emerging to the surface of the heart from within outward

Various points of the ventricular wall become activated at different intervals according to the length of the Purkinge pathway and the thickness of the muscle walls The thinnest portions receive the stimulus earliest auricles the surface is covered in 04 to 05 seconds The ventricular surface becomes activated in 03 seconds or less because of the Purkinje net-work The cardiac impulse arrives earliest at a point near the right apex, then the left ventricle becomes activated, first at the apex, a little later at its middle and finally at the base. The last point to receive finally at the base the stimulus is the base of the right ventricle, . the figure being 0288 seconds The rate of flow of the excitation wave is five times as fast through the Purkinje system as it is through the cardiac muscle 1

Physiological research has therefore established the fact that the base of the right ven-

tricle is the last point of the ventricular musculature to receive the stimulus, electro-negativity being found latest in this area and the final contraction of the ventricle takes place in this particular region Investigations from another angle have given findings rather pertinent in Eppinger and Rothberger this connection found a difference of Ol second between the aortic and pulmonary pulses, due to the nonsimultaneous contraction of the two auricles Katz's working along the same lines in reference to the systole of the ventricles, found that the right ventricular systole terminates 029 seconds later than the left Asynchronism of the ventricles is the rule

Turning to the electrocardiogram, which is the graphic representation of electrical differences during cardiac activity we find that the normal tracing consists of three waves, the first, termed the P wave, is the result of auricular stimulation, the second, known as the Q R S complex, represents the transport of the excitation wave through the Purkinje system, and the end-deflection, or T wave is the symbol of the final electrical activity of the ventricles And normally the T wave is upright in all three derivations of the electrocardiogram

In experiment, definite changes in the direction of the T wave have been found to follow prolongation or retardation of the electrical response and the present study is an attempt to co-ordinate the experimental and clinical data in order to obtain a simple and logical explanation for certain aberrant phenomena occurring in cardiac disease

It has been found that cooling and warming the ventricular surface produced striking alterations in the form of the T wave. On warming the apex, the T wave becomes upright when it is inverted, whereas, cooling the apex modifies the end-deflection in the opposite direction. Cooling the apex of the left ventricle gives an effect opposite to that produced by cooling the right base.

Adrian, in experiment has shown that cooling prolongs the duration of the electrical response in nerve and muscle. Local modifications of temperature upon the ventricular surface alter the T wave through their effect upon the electrical response. The action of cold on

the surface, experimentally, retards electrical activity in the superficial layers of the cardiac muscle. Mines contends that the form of the T wave is the result of an electrical imbalance incident to the decline of the excitation wave The return to the resting state is not uniform and simultaneous at all points so that differences in electric potential arise, the portion that remains active last being relatively electrically negative to the part that has already completed its electrical activity. If the left apex finishes in advance of the right base the T is positive If the right base finishes in advance of the left apex the T is negative. It has already been pointed out that the right base is activated last and that its systole is the latest of any portion of the heart Therefore, the upward direction of the end-deflection is the normal condition, because the right base is last

An experiment undertaken to study the effect of cooling the apex of the human heart, revealed interesting changes in the T wave Five normal individuals were given three glasses of iced-water to drink at a temperature of 40 degrees F The subjects drank the icedwater while lying down Lead 1 showed no Lead 2 showed the T decreased in amplitude, and Lead 3 showed T inversions The effect disappeared in from 10 to 15 min-An ice-bag over the heart gave no change and hot lemonade produced no altera-To determine the portion of the heart influenced, the individuals were given three glasses of Barium mixture and X-rays were taken without disturbing the subjects plates showed that the posterior-inferior aspect of the left apex was the most influenced 6

Fred M Smith⁷ in "Experimental Work on Coronary Ligation," observed that ligation of the left coronary artery caused inversion of the T wave in 24 hours Ligation of the right coronary produced no change in the form of the end-deflection

It is apparent that the effect of cooling the right ventricle and ligating the right coronary produce similar results. Cooling the left ventricle and ligating the left coronary also give identical changes in the T wave

Willius in a survey of 1106 cases founds

Inverted T, in Lead 1 (140 cases)

Inverted T, Lead 1 (117 cases)	66% died	None with-
out cardiac complaint.		

Inverted T, Leads 1 and 2 (52 cases) 67% died. Only one reports no cardiac complaint.

Inverted T, Leads 1, 2 and 3 (58 cases) 50% died No patient without cardiac complaint.

Inverted T, Leads 2 and 3 (135 cases) 25% died 16% reported no cardiac complaint

7 patients had thyroidectomy performed and were cured Inverted T, Lead 3 (487 cases) 10% died 106 or 20% were without cardiac complaints

Resume of Mortality

Leads 1 and 2	67%
Lead 1	66%
Leads 1, 2 and 3	50%
Leads 2 and 3	26%
Lead 3	10%

The wave T is positive in all three Leads of the electrocardiogram normally and the statistics of Willius give overwhelming evidence that disease of the myocardium manifests itself in striking alterations of the T wave.

The force and power of the heart reside in the efficiency of the left ventricle With the onset of disease the intrinsic circulation of the heart suffers, the transmission of the electric impulse through the ventricular musculature is impaired, the production of stimulus material, the removal of fatigue products, the contractility and tonicity are all slightly below par Clinically, the first sound at the apex shows a loss of muscular tone, a relative mitral insufficiency manifests itself in the form of a soft blowing systolic apical murmur and the electrocardiogram registers a delay in the reception and response to the cardiac impulse by a flattening of T 3 With progressive myocardial change, the T wave becomes more and more altered until complete inversion takes place In other words, the left ventricle now is the last to recover from its refractory state and its influence imposes itself upon the enddeflection, dragging it downward. The greater the myocardial affection, the greater the tendency of the T to become inverted And this condition can be present without any alteration in the Q R S complex because the changes are taking place in the myocardium and not in the Bundle of His or its branches gives 10% mortality in this group (Figs 1 and 2)

Further progression in myocardial affection

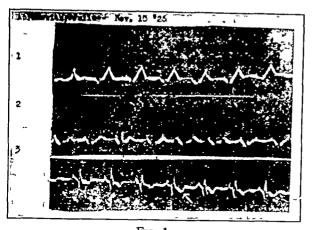

Fig 1 A J Male, age 23, weight 170 lbs Chief complaint, precordial pain Heart was slightly enlarged to the left, a short soft systolic at apex Electrocardiogram showed inverted T wave in lead 3 Nov 15, 1926

shows inversion of T 3 and T 2, a tracing similar to the one obtained in the iced-water investigation in which the left apex and its adjoining central portion were involved lius gives 26% mortality in this class (Fig

Still more serious are the cases showing in-

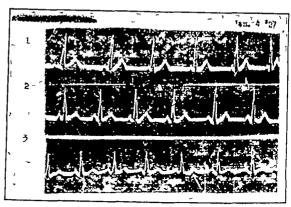

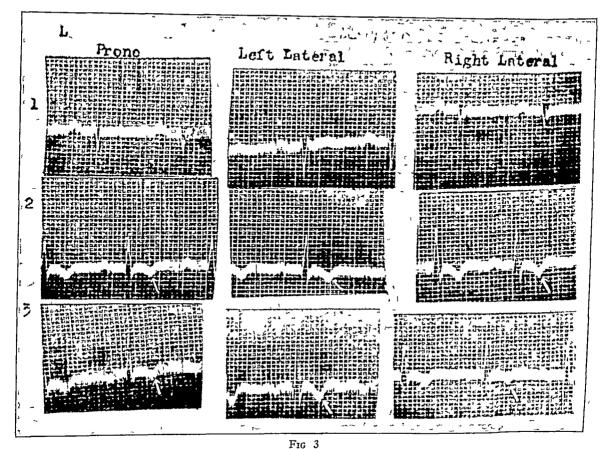

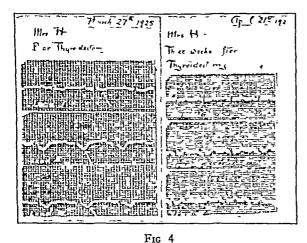

Fig. 2 Same patient as in Fig 1 Patient feels better, no precordial pain Systolic at apex as before Weight 158 Was given thyroid extract, gr 1/5, tunce daily Electrocardiogram taken Jan 4th, 1927, showed T 3 normal

L A Male, age 30 Clinical diagnosis Ch Adhesive Pericarditis Electrocardiogram shows inversion of T3 and T4

version of T3, T2 and T1, in which there is every reason to believe that the entire left ventricle is affected. In the iced-water affair, T 3 and T 2 showed inversion, T 1 remaining upright because the cooling effect did not extend to the left base, but cooling the left base in experiment, does invert T1, therefore it is reasonable to infer that T 3, T 2 and T 1, when inverted indicate an affection of the entire left ventricle It does not follow that all individuals in this group have permanently damaged In fact, it is just this sort of tracing that would go well with a general systemic disturbance, toxic in nature This interpretation must be given in the case of Mrs $\,H\,$ who showed inversion of $\,T\,3$, $\,T\,2$ and $\,T\,1$, but an electrocardiogram taken three weeks after thyroidectomy, presented a normal curve, Willius gives a mortality of 50% for this type. (Fig 4)

H R. Female, age 45 Clinical diagnosis, Thyrotoxicosis Electrocardiogram taken March 27th, 1925, showed T inversion in all leads Electrocardiogram taken April 21st, 1925, three weeks after thyrodectomy showed normally directed T waves in all leads

The outstanding feature in the survey of Willius is the inversion of T1 and the combination of T1 and T2 It is clear that this sign is part and parcel of a condition affecting the most important area of cardiac activity, the power behind the throne Willius finds the greatest injury present in this particular set of patients, the mortality mounting to 66% (Figs 5 and 6)

From what has gone before it is evident that cooling the left ventricle, ligating the left coronary and disease of the left ventricle, all produce inversions of the T wave because all three conditions tend to retard electrical activity. In the human heart, modifications of temperature are improbable, in so far as any one portion of the heart is concerned. The

only possible reason for the T inversion is disease of the ventricle

M H Nathanson, writing in the Proceedings of the Society for Biology and Medicine, Feb 1927, describes 8 patients with severe diphtheritic toxemia, 7 showing T inversions In 2 cases with the T inverted in all 3 leads, death took place within one week. The 5 cases that recovered showed a gradual change to the normal upright position, the T at first becoming less negative, then iso-electric and finally upright. The earliest return to normal was 6 weeks after onset of the disease.

We have seen that inversion of T 3, T 2 and T 1, indicates involvement of the entire left ventricle principally, and inversion of T 3 and T 2 is found in abnormal conditions affecting the left apex and the adjoining central portion, it follows therefore that inversion of T 1 means disease of the left base

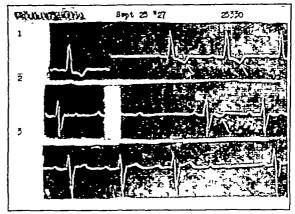

Fig 5

E H Male, age 35 Clinical diagnosis Rheumatic endocarditis affecting the initial and aortic valves. The electrocardiogram shows the Wenckebach type of partial heart with blocked auricular systoles and inversion of T1 and T2, localizing the lesion at the base of the left ventricle in the neighborhood of the left branch of the His bundle

Recently a most interesting series of experiments upon rabbits demonstrated that the above conclusions have experimental confirmation. Becke, Johnson and Harris, to working on experimental endocarditis, found definite changes in the cardiac muscle following injections of adrenalin and caftein sodium benzoate. Electrocardiograms taken at the time revealed alterations of the T wave in leads 1 and 2. At autopsy, all the animals showed the lesion to be at the base of the left ventricle (American Heart Journal, Feb. 1927.)

Experimental evidence of this nature lends convincing support to the conclusions drawn in this paper

Co-ordinating the foregoing with the statistics of Willius, we find a marked relation between them Thus.

Inversion	Region Affected	Mortality in 4½ Years
T3 T3 and T2	Left apex Left apex and adjoining	10% cen-
T3, T2 and T1 T2 and T1	tral portion Left ventricle, entire Left base and adjoining	26% 50%
Т1	tral portion Left base	67% 66%

Lewis has never found an inversion of T2 alone and Willius has never observed inversion of T1 and T3 without T2 being involved This is as it should be According to Einthoven, lead 2 is the algebraic sum of lead 1 plus lead 3 and nothing can appear in lead 2 which is not present in lead 1 or lead 3 or both

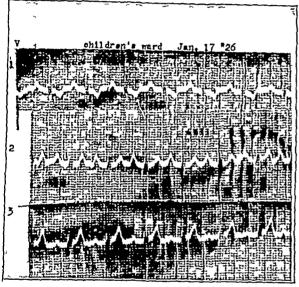

Fig 6

V E Female, age 5 Rheumatic endocarditis affecting all four valves Electrocardiogram shows inversion of T 1, a very serious myocardial condition affecting principally the base of the left ventricle

The T wave does not register disease of any one portion of the heart muscle directly is only a graphic representation of interferences and oppositions in the electrical phenomena and changes in the myocardium must be of a severe grade, whether temporary or permanent, to cause any alteration sion must be extensive enough and must involve the left heart sufficiently in order to alter the direction of the final deflection tionally, serious disease of the heart may exist without being revealed in the electrocardio-Alternation of the heart, signifying cardiac exhaustion, may show a normal trac-

In the vast majority of the cases, definite disease of the heart will give conspicuous

changes in the electrocardiogram is it possible to localize the site of the cardiac pathology but it is also possible to follow the course of the ailment, improvement being shown by the tracing assuming a more normal It is true that disease of the right base does not alter the T wave, but in the course of time, a right preponderance or a change in rhythm manifests itself We have already seen that disease of the left base gives T 1 inverted and injury to the left apex causes inversion of T3

It is apparent that disease of the myocardium from whatever source, or interference with its nutrition through disease of the intrinsic blood supply are the media that produce alterations in the T wave The constant and unceasing activity of the cardiac musculature requires, of necessity, a very rich and unfailing blood supply Impairment of the normal ebb and flow of the intrinsic cardiac circulation would retard the normal ventricular mechanism, causing delay in electrical ac-Electrical imbalance results and the direction of the T wave becomes altered

Erichsen, 11 writing in 1842, on the influence of the coronary circulation upon the action of the heart, says that any circumstances that may interfere with the passage of the blood through the coronary arteries, either directly as in ossification of the coats of these vessels, or indirectly by there not being sufficient blood sent out of the left ventricle, as in cases of extreme obstruction or regurgitant disease of the aortic or mitral valves, may occasion the fatal event It is the contention, in this article, that the fatal event is fore-shadowed by an inversion of the T wave in a measure corresponding to the degree of cardiac insult more, the electrocardiograph is an instrument of such delicacy that it will display alterations in cardiac function that are incapable of detection by any other means and will localize the lesion to an extent that will make clear the underlying pathology

The following conditions produce inversion of T1 through a retardation of the cardiac impulse

I Cooling the left ventricle, in experiment, delaying electrical activity

2 Ligating the left coronary, in experiment,

interfering with nutrition

3 Premature contractions arising at the base and apex of the right ventricle right ventricle becomes stimulated prematurely to contract, the left ventricle follows and the T wave is directed downward

4 Coronary sclerosis and cardiac fibrosis affecting the base of the left ventricle principally Interference with the blood supply in this particular area delays the electrical response, the right ventricle answers in advance of the left and the T wave reverses its normal direction

5 Digitalis, through its influence on the vagus and the cardiac musculature by causing a blocking of the excitation wave 12

On the other hand, the right ventricle, in contrast to the left, in the presence of abnormal conditions produces no alteration in the direction of the T wave In some of these situations, the T wave becomes even more upright because the response is last normally and with retardation the electrical activity is even later, hence there is no change in the form of the T wave Thus,

1 Cooling the right ventricle, in experiment, heightens the upright T wave

2 Ligating the right coronary, in experi-

ment, produces no change in the T wave 3 Premature contractions arising in the left The left ventricle becomes stimulated prematurely to contract, the right ventricle follows (the normal sequence) and the ${
m T}$ wave shows the normal upward direction

4 Coronary sclerosis and cardiac fibrosis affecting the right ventricle principally, would retard the electrical response and the final activity would be still later than the time of the normal effect No change would be registered in the direction of the T wave

5 Digitalis affects the left ventricle most because it has the greatest muscle bulk

Conclusions

1 The T wave in the electrocardiogram is the graphic representation of the final electrical activity of the ventricular musculature and pictures in composite form the differences in electrical potential developed in the ventricles

2 The T wave is separate, distinct and independent of the Q R S complex

3 The direction of the T wave gives a valuable clue to the condition of the ventricular musculature and may be employed for the localization of the region affected

4 Successive alterations of the T wave give an insight into the progress of the disease It is an invaluable aid in cardiac prognosis

5 The appearance of an inverted T wave, especially in lead 1 is a danger signal in disease of the heart

LATENT PARANASAL SINUS INFECTIONS

. By WILLIAM LAWRENCE GATEWOOD, M.D., F.ACS, NEW YORK, N.Y.

N the title of this paper the word "latent" is used to specify obscure infections of the paranasal sinuses which do not present the outstanding symptoms of either the acute or chronic forms of sinus disease These obscure cases are generally low grade infections, yet some show recurrent acute exacerbations when the condition then becomes very evident and is no longer obscure.

In the diagnosis of these conditions affecting the two sinuses most commonly involved Namely, the maxillary and frontal, I have found transillumination very unsatisfactory With the sinuses full of opaque pus the shadow from the lamp is very decided these low grade infections, however, there is often only an infected mucous membrane with little or no free pus and under transillumination no definite shadow is produced One of the standard signs of antrum and frontal sinus disease is therefore lacking in these latent cases

Greater diagnostic acumen, however, is being employed through the proper interpretation of good X-ray plates In searching for focal infections the writer has made it a routine practice, for some time past, to examine carefully skiographs of the nasal sinuses pictures are taken in different directions and each serves as a control to the other

I personally examine the plates very carefully, comparing my findings with the diagnosis from the roentgenologists and with my own clinical oservations After many years of careful study I have come to the conclusion that there are a great number of infected sinuses which I formerly did not recognize I have no doubt that with the improvement in roentgenology and with its increased employment, many others are also discovering these

low grade infections, but even now adequate attention is not being given to the importance of their discovery and treatment. They are often not recognized because of the absence of the two classical diagnostic signs—a dark shadow by transillumination and the presence of pus located in the middle nasal fossa.

Reference has already been made to the unreliability of transillumination. It frequently fails because the secretion is of a glairy translucent consistency which does not show in transmitted light but which shows an appreciable shadow with the X-ray. This glairy muco-pus is often hard to distinguish in examination of the nose either by anterior or

posterior rhinoscopy

In the diagnosis of nasal sinus infections of long standing the writer learned to rely very greatly on the condition of the lymphatic tissue in the pharynx which lies in a vertical streak immediately posterior to the posterior pillar fauces. When infected secretion is being drained into the pharynx this tissue becomes congested and stands out as a red swollen band and this means an infection which is of

nasal origin

In studying the skiographs, if only those cavities are considered diseased which show a marked opaque shadow there will be many foci of infection overlooked The shadows should be classified as clear, questionable, cloudy and opaque Several plates should be taken, including an anterior and lateral is always a great mistake to rely on the readings of one plate in the diagnosis of such ob-In determining the degree scure infections of opacity the shadows are compared with each other Each picture is considered a control on the other and in this way a slight degree of cloudiness shown in each picture has an intensified significance, and when combined with the enlargement of the pharyngeal lympathic pillar, it is in all probability diagnostic of a low grade infection

The importance of these low grade sinus cases lies in the general or remote symptoms resulting from them. Many of them have no localized pain or even discomfort from the discharge, and there is little to call attention directly to these cavities. The symptoms are remote and are those which are becoming more and more recognized as due to focal infections. The most important of these, which have appeared in my cases have been generalized headache, neurasthenic symptoms, anemia, catarrhal otitis media, cardio-vascular and nephritic changes.

Absorption from a latent antrum infection will, as a rule, produce symptoms which are more pronounced than corresponding infections of the other accessory cavities of the nose. This probably being due to the greater

size of the maxillary sinus as compared with the frontal, ethmoidal and sphenoidal sinuses

Latent disease of the posterior ethmoidal and sphenoidal sinuses will not infrequently cause retrobulbor optic neuritis with in some instances loss of vision, partial or complete The more one studies the structures surrounding the sphenoid sinuses the more one is impressed with the importance of a thorough comprehension of the pathologic conditions found here These sinuses vary greatly in size and position even in the same individual They may extend outward and backward into the greater wings of the sphenoid to the Gasserian ganglion and have a capacity of twelve centimeters or more The pituitary body, chiasm and optic nerve are in relation to the superior wall, while externally lie the optic, abduceus, oculomotor, trochlear, ophthalmic and maxillary nerves, the cavernus sinus, the internal carotid artery and the dura of the middle fossa

Cases of brain abscess and cavernous sinus thrombosis from sphenoid sinus disease do occur, but fortunately are rather rare complications, while affection of adjacent nerves producing intense neuralgias are frequent. Involvement of the optic or sixth nerve through disease of the sphenoid sinus is explained by the close proximity of the nerve to the sinus, these structures being separated by a paper thick-

ness of bone

In demonstrating on the cadaver the anatomy of this region the writer has often inadvertently removed this fragile bone while detaching the lining membrane of the sphenoid sinus thus exposing a considerable area of dura Not long ago one of the most prominent rhynologist in this city accidently injured the cavernous sinus while opening the sphenoid and the patient died of hemorrhage in fifteen minutes. Familiarity with the anatomy by morgue training can not be too strongly urged before attempting this intricate field of surgery

Before concluding my remarks on this important subject let me say a few words regarding the treatment. This is necessarily operative and only in those cardio-vascular cases in which operation must be excluded are we justified in prescribing local treatment such as nasal washes and suction. Once these cavities are chronically infected they remain diseased until proper surgical treatment is carried out.

I shall not attempt to go into the technic of the various operations. I will mention, however, that certain details will be essential if we are to expect a complete cure. Conservatism should when possible always take the place of radicalism, bearing constantly in mind that it is easy to remove healthy tissue, but extremely difficult for nature to replace it. This being especially true in surgery of the

intranasal region where there is a limit to the depth of granulation tissue which can be properly nourished

The citation of numerous cases would only bore you and serve no useful purpose. Hence I will limit my report to three cases which recently came under my observation and care, each of which have particular bearing on the points I have endeavored to emphasize in the preparation of this paper.

Case No 1 Man twenty-eight years old referred for relief of nasal obstruction

Examination revealed an acutely deflected nasal septum which almost occuled the right nasal passage making it impossible to examine the ethmoidal region by anterior rhinoscopy. Posterior rhinoscopy showed the presence of thin glairy streaks of secretion reaching from the posterior nares to the lateral naso-pharyngeal wall on the right side. Both posterior lymphatic pillars were red and thickened.

Illumination of the maxillary sinuses with the bulb in the roof of the mouth was very indistinct suggesting disease of both cavities Illumination of the frontal region showed both frontal sinuses to be clear

The diagnosis of sinus disease was very evident, but to determine definitely which sinus or sinuses were affected seemed impossible without the aid of the roentgen-ray. Satisfactory plates were made and these gave a positive shadow in the right frontal, anterior and posterior ethmoidal and sphenoidal regions. X-ray findings in this case reversed my transilumination findings. Operation two days later revealed extensive disease of these sinuses.

In the study of this case it was not difficult to detect disease of the ethmoid and sphenoid clinically as the post-rhinoscopic examination revealed this with a fair degree of certainty. On the other hand it would be nothing short of guess work to state whether the other sinuses were or were not involved without the aid of an X-ray

I did not feel willing to accept the positive findings which resulted from transillumination of the antra, nor was I ready to believe there was no involvement of the frontal as indicated by transillumination. Had the X-ray examination not been made and the transillumination findings accepted as the only diagnostic evidence, this patient would most likely have been subjected to unnecessary surgery of the maxillary sinuses, and the frontal sinus which was badly diseased would have escaped treatment.

Case No 2 This patient is a woman fiftysix years of age whom I saw in consultation Her chief complaint being neuritis involving the left shoulder, arm and forearm which had

existed more than a year, the pain sufficiently acute to cause her to remain in bed for weeks at a time with the arm in a fixed position

While making preparations to examine her nose and throat she informed me that she thought the cause of her trouble might have been discovered had her physicians ordered examinations of other parts of her body as often as they had the nose and throat. She stated that all agreed that her tonsils were diseased and she supposed my opinion would not greatly differ from theirs. She also said that at her age she did not care to have her tonsils removed and would not submit to the operation unless we were sure that nothing but the tonsils could be the cause of her neuritis.

A careful examination of the nose revealed no pathology. Inspection of the throat showed the tonsils to be of fair size, and the surrounding pillars did not appear inflamed. Pressure on the anterior pillars failed to express detritus from the tonsil crypts.

The pharyngeal lymphatic tissue just posterior to the posterior pillar appeared definitely enlarged and red. This made me immediatly suspicious of sinus involvment. I considered this sufficient evidence to warrant my making a tentative diagnosis of latent sinus infection.

The X-ray plates showed a questionable shadow of the right maxillary sinus. Operation on this sinus the next day was followed in less than ten days by complete relief of pain and tenderness of the shoulder, arm and forearm. Three months later this patint stated that she was entirely free from all discomfort and felt perfectly well in every way.

This is the type of case that is too frequently subjected to the removal of tonsils resulting in not the slightest relief of symptoms. While diseased tonsils are not infrequently the cause of neuritis, one is not justified in condemning these organs until proper examinations are made which will exclude other possible sources.

Case No 3 Man twenty-five years old complaining of right nasal obstruction and generalized headache with occasional accentuation of pain in the occipital region

Examination of the anterior nares revealed a pronounced deviation of the septum, the convexity on the right side. Examination of the post-nasal space showed signs of posterior ethmoidal and sphenoidal disease. X-ray plates gave marked evidence of an infection of the right ethmoidal and sphenoidal regions.

Operation two days later consisted of resection of the septum, eventeration of the ethmoidal cells and removal of the anterior wall of the sphenoidal sinus. One week following the date of operation this patient suddenly discovered that he had recovered the sight in his right eye. This was noticed purely by accident

while rubbing the left eye Until this time he had made no mention of his impairment of vision and I was greatly surprised to learn of it. On questioning him he stated that depreciation of vision in this eye became noticeable about a month before he came to me about his nose, that he had consulted an oculist who had told him that the nerve in the eye was dead, and there was no possible chance of his ever regaining his sight. After this he concluded there was nothing to be done and accepted it as part of fate.

He could now read the newspaper one foot away and on closing first the right then the

left eye, he could see as well with the right eye as he could the left

This was evidently a case of retrobulbar optic neuritis due to disease of the posterior ethmoid and sphenoid which would have resulted in permanent loss of vision had he escaped surgical treatment of these sinuses

The return of vision in this case after sinus exenteration was done, has impressed upon me the necessity of enquiring into eye symptoms hereafter in all sinus involvements and when discrepancies are discovered to refer them to a competent ophthalmologist for a report

THE WASSERMANN TEST IN THE DIAGNOSIS AND TREATMENT OF SYPHILIS By ARTHUR SAYER, M.D., NEW YORK, N. Y.

AT first glance the subject matter of this paper may appear quite elementary and simple. It may appear to some of you as A B C stuff which should be known to every physician. Probably some may hastily dogmatize their opinions by the following formula "A negative Wassermann means no syphilis and no necessity for anti-luetic treatment—A positive Wassermann means syphilis and necessity for anti-luetic treatment." Such a summary, however, does not reveal a true or an adequate comprehension of the subject.

I feel that the subject merits full discussion and that its understanding is of inestimable value in the medical practise. I shall endeavor in this paper to present the subject matter from various angles, and to consider the proper evaluation of the positive and negative Wassermann report both in diagnosis and treatment.

We are all aware of the significance of a positive Wassermann reaction Except for a few diseases which are rare in this country, it is pathognomonic of the existence of syphilis in that individual whose blood serum or spinal fluid so responds to that test Such rare diseases as Leprosy¹ 2, 8 and Yaws 4, 5 also respond with a positive Wassermann blood test. But these diseases need not necessarily confuse the physician by their positive Wassermann report, for they can usually be differentiated from syphilis by further bacteriologic as well as clinical study of the case Rarely also, some cases of tuberculosis respond with a positive Wassermann test even though that individual is free from any luetic

We are also fully agreed that having definitely diagnosed a case as syphilitic, that the patient must be subjected to approved vigorous anti-luetic treatment, except in the presence of certain known contra-indications. This treatment should be continued according to a definite plan until the physician feels that certain criteria for the cure of the syphilitic infection have been met.

We will therefore state that the significance of a positive Wassermann report is

1 That the particular individual has lues

2 That he is in potential danger from many serious pathologic degenerations in his viscera with resulting impairment of health

3 That he is therefore in need of antiluctic treatment to arrest the further course of this disease

It is, however, much more difficult and confusing to interpret and evaluate a negative Wassermann report in some cases Even those expert in diagnosis will often be puzzled when a Wassermann test in a given case is reported negative. Many cases of syphilis may at times give negative serologic findings The physician depending solely on the laboratory for his diagnosis will therefore often fall into grievous error. The clinical picture may be very suggestive of lues and yet the Wassermann report may not corroborate the clinical impression. At other times the clinical picture is positively that of syphilis and vet ordinary Wassermann tests prove negative Suffice it to state that whenever the clinical picture is suggestive of syphilis repeated Wassermann tests should be performed The provocative Wassermann tests and other refinements of serologic technique should be employed before abandoning the diagnosis of lues in cases where the clinical picture suggest that diagnosis

We must also remember that there are other symptoms just as important as the Wassermann reaction in the diagnosis of lues. Indeed there are certain symptoms which may be considered just as diagnostic of lues as a positive Wassermann, i.e., Argyl-Robertson pupil, Hutchinsonian teeth, interstitial keratitis, aortic aneurism, certain bone changes, etc. We must not forget that the positive Wassermann is only one of the symptoms of syphilis. Other symptoms of syphilis may be present even in the absence of the positive Wassermann. The mere absence of the positive Wassermann in a given case is therefore

insufficient to preclude syphilis from the diagnosis

The physician relying mostly on his clinical acumen and his evaluation of the various symptoms will often be loathe to surrender his diagnosis of lues even though the ordinary serologic tests are reported negative. He will insist on spinal fluid examinations (Wassermann globulin content, cell-count, colloidal gold curve), provocative Wassermanns and certain refinements of the Wassermann tests in the hope of obtaining substantiating laboratory findings Even after all laboratory reports are negative, he may still insist on the therapeutic test to prove his opinion that the case is luctic Many a case so baffling in diagnosis has responded to specific therapy, and thereby proved the diagnosis of syphilis through the striking benefits obtained from the anti-luetic treatment

In general we will therefore state that the positive Wassermann is sufficient to prove the existence of syphilis in the individual (except for such diseases as yaws and leprosy, etc.) While the negative Wassermann in the absence of certain definite criteria does not necessarily disprove that

the person has lues

When then does this negative Wassermann mean that the individual is most certainly free of lues? There are certain criteria and facts necessary for our complete knowledge in order to definitely assert this statement. The following are

important considerations

I The individual must give no history of a primary lesion or of secondaries. He must be sure that he has never had a suspicious genital or extra-genital lesion. Even a history of ure-thritis may cloud the picture and throw an element of doubt on the case. We occasionally see an intra-urethral chancre develop in a person who first showed only the symptoms of an ordinary urethritis. Similarly, no history of a generalized eruption with adenopathies, or buccal mucous membrane lesions may be admitted.

2 There must be no suspicious symptoms or stigmata suggesting syphilis. The presence of a scar on the penis, of a corneal opacity of inflammatory origin, of cranial nerve palsies, of an aortic aneurysm, of a certain characteristic glossitis, or many other symptoms usually associated with lues is sufficient cause to throw doubt on the nega-

tive Wassermann report.

3 The individual must give a history of never having had a strongly positive Wassermann reaction. Once a person has had a ++++ Wassermann, the onus of lues is strongly attached to them. Of course, a + or 1+ report should never be considered as diagnostic of lues in a person who has never had any history of lues. Much unnecessary distress is often experienced by a person from such a 1+ or 1± Wassermann report. Such a report is best to be disregarded and considered as of no significance if all of the criteria here discussed are met.

4 The individual must never have been treated for lues. Once having been treated for lues, even though the treatment was insufficient judging by present standards, it may mask and retard the Wassermann reaction though other symptoms of lues continue to develop and progress

5 We must be sure that the person was not under the influence of alcoholics or an anaesthetic at the time that the Wassermann was taken. As later mentioned, the recent ingestion of alcohol or a general anaesthetic will usually obscure a

positive Wassermann reaction

6 The general health of the patient must be fair. If the person is very much rundown or cachetic, their body resistance may be so poor that the anti-body formation is inhibited. The serum of such a debilitated individual often gives a negative Wassermann reaction even though that person suffers from lues.

7 Occasionally the age of the patient is a factor Rarely children under one year of age may as yet fail to show a positive Wassermann even

though they are congenital syphilities 7 8

If a person answers favorably to all of the above mentioned criteria, then a safe presumptive diagnosis may be made of the non-existence of lues in that individual Should there be any doubt in any of these criteria, such as a history of a doubtful penile lesion, a former doubtful positive Wassermann (± or 1+), some former doubtful treatment for lues (some intravenous medication or intramuscular injections), some doubtful clinical symptoms, such as inequality or irregularity of pupils, etc, etc, then a negative Wassermann report must be carefully checked up In such cases a provocative series of Wassermann tests should be done and the study of the spinal fluid undertaken before we may pronounce a definite opinion of the absence of syphilis is always best to repeat the Wassermann tests after several months in order to make assurance doubly sure

Table showing the conditions under which the Wassermann test is positive or negative

The Wassermann Is
Positive

1 After the chancre is fully developed. This usually occurs about three weeks after the chancre first occurs

The Wassermann Is Negative

- 1 In the early stages of the chancre. It usually takes twenty-one days after the first appearance of the primary before the Wassermann becomes positive.
- 2 In over 95% of cases of untreated secondary syphilis
- 2. In 5% or less of cases of untreated secondary syphilis. This usually occurs when the individual is very rundown or in cases of malignant syphilis.
- 3 In 90 to 95% of untreated tertiary syphilis
- 3 In over 70% cases of treated tertiary syphilis Of course it is to be understood that this depends on the amount of treatment and the kind of treatment instituted

- 4 In a small percentage of cases of treated syphilis The Wassermann test may remain persistently positive in spite of the treatment.
- 5 In congenital syphilis After one year of age 99% of untreated cases show a positive Wassermann.
- 6 In certain diseases which are rare in this country, such as yaws, nodular leprosy, trypansomiasis, relapsing fever, yellow fever, malaria. These often give non-specific positive Was-

In fevers, such as pneumonia, erysipelas, there may occasionally be a false positive Wassermann

sermann reactions

- 4 In a small percentage of untreated tertiary syphilis This happens even though other symptoms of syphilis may be present.
- 5 In some cases of congenital syphilis in infants under one year of age ^{7 8} Here the Wassermann may be negative even though other symptoms of syphilis are found. In such cases of suspected congenital lues, the Wassermann should be repeated at intervals of three months.
- 6 When the person is under the influence of alcohol Under such conditions the Wassermann test is negative even though that individual usually shows a positive Wassermann reaction.

When the test is taken within twenty-four hours after the administration of a general anaesthetic. Here again the Wassermann test is negative in an individual who usually shows a positive Wassermann

It will be apropos to consider briefly the subject of the fluctuation of the Wassermann and the provocation of the Wassermann test sermann in some cases of syphilis, may vary from various degrees of positiveness to negative and vice versa in a short period of time, apparently without cause The reason for these fluctuations may be sometimes sought in the technique with which the test is performed, but often even with the same technique the Wassermann will fluctuate for some unexplainable reason As to the provocation or activation of the Wassermann, that is a procedure which is employed either in diagnosis of doubtful cases, or to determine when a syphilitic individual has been sufficiently treated It must also be borne in mind that occasionally a syphilitic case after vigorous treatment may for years have a negative Wassermann, and then revert to a positive Wassermann it should be noted that the Wassermann may become more strongly positive temporarily in some cases of syphilis during treatment is to say, occasionally the Wassermann which was negative or weakly positive becomes more strongly positive after an additional course of antiluetic therapy

It is also well known that in some luetic cases the spinal fluid Wassermann may be positive even though the blood Wassermann

is persistently negative. It is to be remembered that no case should be considered properly investigated unless both the blood and spinal fluid have been studied. It is also a routine procedure to carefully test the spinal fluid of all treated cases before deciding that they have been fully and adequately subjected to anti-luetic therapy and in no further need of treatment. If both the blood and spinal fluid are normal after sufficient anti-luetic treatment, then the patient may be considered as cured.

We will finally consider the role of the Wassermann test in treatment We consider the Wassermann as a most important guide in determining the effect of our anti-syphilitic We consider treatment as effective if drugs the Wassermann is reduced from strongly positive to weakly positive or negative. If the Wassermann test remains strongly positive, that is not necessarily an indication of the ineffectiveness of the treatment In a certain proportion of cases the Wassermann remains persistently positive even though there is definite improvement of other clinical symptoms For instance, cutaneous or visceral lesions may heal and the amelioration of complaints be striking, and yet the Wassermann report remain stationary We must remember that the positive Wassermann is only one of the symptoms of syphilis Occasionally all serologic tests are negative yet careful repeated neurological or X-ray examination reveals an unarrested luetic The expert syphilographer does not therefore rely solely on the Wassermann as his guide during treatment. He is equally guided by clinical signs and symptoms His final verdict is based a great deal on the Wassermann reports, but the patient as a whole is his greatest and most thorough consideration

EUROPEAN MEDICAL INFORMATION

Many American physicians who go to Europe for pleasure would take advantage of the medical lectures and clinics if they knew where information concerning them could be obtained readily An outline of the teaching facilities of the larger European cities has been made by the Bureau of Chincal Information of the New York Academy

of Medicine and is published on page 751 of this issue. The cities of Europe as well as those of New York State maintain centers of medical information similar to that of the New York Academy of Medicine, and this information is available to any physician in New York State through the New York Academy of Medicine

- 4 In a small percentage of cases of treated syphilis The Wassermann test may remain persistently positive in spite of the treatment.
- 5 In congenital syphilis After one year of age 99% of untreated cases show a positive Wassermann.
- 6 In certain diseases which are rare in this country, such as yaws, nodular leprosy, trypansomiasis, relapsing fever, yellow fever, malaria These often give non-specific positive Wassermann reactions

In fevers, such as pneumonia, erysipelas, there may occasionally be a false positive Wassermann

- 4 In a small percentage of untreated tertiary syphilis This happens even though other symptoms of syphilis may be present
- 5 In some cases of congenital syphilis in infants under one year of age 7 8 Here the Wassermann may be negative even though other symptoms of syphilis are found. In such cases of suspected congenital lues, the Wassermann should be repeated at intervals of three months
- 6 When the person is under the influence of alcohol Under such conditions the Wassermann test is negative even though that individual urually shows a positive Wassermann reaction.

When the test is taken within twenty-four hours after the administration of a general anaesthetic. Here again the Wassermann test is negative in an individual who usually shows a positive Wassermann.

It will be appropos to consider briefly the subject of the fluctuation of the Wassermann and the provocation of the Wassermann test The Wassermann in some cases of syphilis, may vary from various degrees of positiveness to negative and vice versa in a short period of time, apparently without cause The reason for these fluctuations may be sometimes sought in the technique with which the test is performed, but often even with the same technique the Wassermann will fluctuate for some unexplainable reason As to the provocation or activation of the Wassermann, that is a procedure which is employed either in diagnosis of doubtful cases, or to determine when a syphilitic individual has been sufficiently treated. It must also be borne in mind that occasionally a syphilitic case after vigorous treatment may for years have a negative Wassermann, and then revert to a positive Wassermann it should be noted that the Wassermann may become more strongly positive temporarily in some cases of syphilis during treatment is to say, occasionally the Wassermann which was negative or weakly positive becomes more strongly positive after an additional course of antiluetic therapy

It is also well known that in some luetic cases the spinal fluid Wassermann may be positive even though the blood Wassermann

is persistently negative. It is to be remembered that no case should be considered properly investigated unless both the blood and spinal fluid have been studied. It is also a routine procedure to carefully test the spinal fluid of all treated cases before deciding that they have been fully and adequately subjected to anti-luetic therapy and in no further need of treatment. If both the blood and spinal fluid are normal after sufficient anti-luetic treatment, then the patient may be considered as cured.

We will finally consider the role of the Was-We consider the sermann test in treatment Wassermann as a most important guide in determining the effect of our anti-syphilitic drugs We consider treatment as effective if the Wassermann is reduced from strongly positive to weakly positive or negative. If the Wassermann test remains strongly positive, that is not necessarily an indication of the in-In a certain effectiveness of the treatment proportion of cases the Wassermann remains persistently positive even though there is definite improvement of other clinical symptoms For instance, cutaneous or visceral lesions may heal and the amelioration of complaints be striking, and yet the Wassermann report remain stationary We must remember that the positive Wassermann is only one of the symptoms of syphilis Occasionally all serologic tests are negative yet careful repeated neurological or X-ray examination reveals an unarrested luetic The expert syphilographer does not process therefore rely solely on the Wassermann as his guide during treatment. He is equally guided by clinical signs and symptoms His final verdict is based a great deal on the Wassermann reports, but the patient as a whole is his greatest and most thorough consideration

BUDGETS OF COUNTY TUBERCULOSIS ASSOCIATIONS

Nearly every county in New York State has a local tuberculosis association which represents the laymen engaged in public health work. The county associations derive their funds from the sale of Christmas Seals which are prepared by the National Tuberculosis Association, whose headquarters are at 370 Seventh Avenue, New York City. The National Organization is the central body which standardizes and coordinates the activities of the associations of the counties, and the services which it renders are invaluable.

One of the services of the National Tuberculosis Association is the promotion of a uniform system of budgeting expenses. The national organization has issued a tentative form (N T A—Form 1025) which arranges the various items of expense and allocates them according to the value of the work which is done, the principal items in which marked changes have been suggested are those regarding the cost of Christmas seal sale and of educating the public in health matters

The promoters of the new budget recognize the well known fact that there is an educational value in every letter asking a citizen to buy one dollar's worth of stamps The budget makers therefore suggest that about one-half of the cost of conducting the Christmas seal sale be allocated to public health education. If, for example, the collection of \$15,000 from the sale of stamps costs \$500 for the stamps and envelopes, \$2,000 for the clerical work of sending and receiving the soliciting letters, and \$1,000 for postage—a total of \$3,500-only \$1,200 shall be entered as the cost of the Christmas seal sale, while \$2,300 shall be entered under the head of Public Health Education

This division of the cost of collecting the Christmas seal money is misleading. The cost of the collection should be stated, and later in the report, the educational value of the letters should be entered as a credit, if it is to be extended at all. The leaders of the National Association are making a study of the opinions of physicians regarding the new form of budget.

LOOKING BACKWARD

THIS JOURNAL TWENTY YEARS AGO

Health Education of Girls—The present day emphasis on health promotion among pupils and students, and the growth of the new woman movements make the following editorial description of the school girl of only twenty years ago, taken from this JOURNAL of June, 1908, read like a page of ancient history

"Herbert Spencer wisely suggested that should we suddenly become an extinct race, and should some future historian find the school-books used by our young women, he would think that he had discovered a race of celibates who were interested in everything but their own lives and happiness. The fact that between forty and fifty per cent of the women admitted to the hospitals for the insane in New York State belong to the class which is spoken of as 'well educated,' can not in itself be taken as a reflection upon the work of the schools, but it does indicate that something is wrong with their manner of life to bring them to this unfortunate state

"The appreciation of the best things in life is happily growing, but unconsciously slowly A

few lectures on hygiene—how to ventilate a room, the harm of tight lacing, the value of sleep, the importance of discretion in diet, and kindred subjects—will not make school girls healthy. Self-preservation and perpetuation is a bigger subject than primary hygiene. It involves all of the functions of the mind as well as the body. It involves all of the day of work and play and sleep. It is the most important thing for young women to study. But in our schools and colleges it is as yet imperfectly grasped.

"There is much that answers to the name of education, which, instead of preparing young women for life, is contributing to their undoing. The one line in which they are least learned is that of natural sciences, which deal with the things that surround us and which are known. Its pursuit is the most profitable and cultivating. It helps the mind and the body, and so long as it continues to be slighted young women will lack salutary education. It is the one line of study that will save their health and preserve them from the pitfalls of mysticism and the cults of mental obliquity"

THE SMALL HOSPITAL IN MEDICAL EDUCATION

Dr James E Sadlier in his Presidential address before the Medical Society of the State of New York on May 22nd, printed on page 639 of the June 1 issue of this Journal, discusses the influence of small hospitals in educating and inspiring physicians to practice scientific medicine with greater efficiency Dr Sadlier gave special credit to the hospitals in the smaller cities and rural com-While these hospitals were especially and primarily for the convenience of sick persons, they also have educated doctors by their laboratories, their staff meetings, and the opportunities for consultations and conferences Hospitals are coming to require the physicians on their staffs to make use of all the facilities of the institution, including consultations with other members of the staff Physicians take pride in their local hospital and the increased skill which it gives to them, and they speak familiarly and proudly of "my hospital" and "my service" They are inspired to live up to the standards of practice which are required in a scientific hospital The hospital has probably been the greatest single factor in raising the standard of the practice of medicine in New York Dr Sadlier has been an interested observer of the trends of medical practice and an ardent promoter of the continuous education of What he says concerning hospitals physicians may be considered to have the authority of the Medical Society of the State of New York which he officially headed and represented during the past year

The following quotations taken from his annual address set forth his views regarding the influence of the smaller hospitals on the practice of medicine

"Two years of office as President-Elect and President of your State Medical Society have presented a wonderful opportunity for me to get acquainted with the physicians of this State, to observe the quality of service they are rendering to the sick, and the character of the men who make up the great rank and file of the field workers of our profession, and to note the environment in which, and the equipment with which, they practice the healing art It has been a source of deep and increasing gratification to observe the excellent type of scientific medical care that is rendered our citizens by the medical profession of There is no question that curative medicine is being practiced increasingly well and that the profession as a body is eager in its desire to render the most efficient service possible

"Progress in the scientific advancement of medicine has been so great that should a surgeon to-day have the same mortality in his practice that appertained in the nineties, he would be a proper subject for investigation

"Many of us feel that too much time is being devoted to the laboratory side and too little to the practical clinical phases of medicine which, in the final analysis, represent to a considerable degree, the real worth of the man in his future work My only criticism of present teaching of medicine would be along the line of stressing the importance of a more practical clinical teaching

"The present hospital with its up-to-date equipment is more and more coming to fill a real need in our modern life, and the medical men in a county which has no general hospital—and there are still a few such counties—are seriously and almost hopelessly handicapped in their effort to care

for cases of disease

"I particularly wish to stress the growing importance of the city of the third class as a hospital and medical center, not only for its citizens, but for those of a vast area of surrounding territory. We are noting in these small cities throughout the state, hospitals of a very modern type fully equipped and in a position to care for all types of disease.

"The hospital of the small city as a medical center is becoming a very important factor in lessening the damage which seemed likely to accrue from the very positive shortage of physicians which exists in rural sections. Furthermore it gives to the young physician a proper environment, adequate facilities for study and work, and the advantages to be obtained from contact and interchange of thought with members of his own profession. One can readily visualize how these institutions are to be a grand step upward for the science and art of medicine.

"The hospital will develop the broader medical man of the present day who realizes the necessity for cooperation with others and the utilization of all beneficial agencies for the proper performance of his work in curative medicine. Realizing this in the diagnosis and treatment of disease means that it will be but one step farther in advance to recognize the importance of adopting similar methods in developing that newer phase of our work which has to do with the prevention of disease.

"Medical men have recognized these changing conditions in their service to the sick, and have qualified themselves to meet the requirements of these hospitals, so that today we find such institutions enjoying the confidence and support of the community in which they are located. The end results compare favorably with those of the older and more advanced hospitals of our cities of the first and second class."

anemia, and secondary anemia the red cells are abnormal In polycythemia a portion of the cells are very resistant, while some cells are slightly more fragile than normal Reticulated red cells of normal size are more resistant than the nonreticulated This test is of value in the differential diagnosis of anemia and for determining the resistance of the red cells and the hemolytic power of the serum—Archives of Internal Medicine, April 15, 1928, xli, 4

A Consideration of Leucemia, with Special Reference to a Subacute Form -Baxter L Crawford and Edward Weiss, writing in the American Journal of the Medical Sciences, May, 1928, clxxv, 5, describe a form of leucemia which runs a subacute course, rather than the short course characteristic of the acute form Usually the onset is insidious, with progressive loss of strength, increasing pallor, slight fever and perhaps fleeting pains in the muscles or Frequently there is a necrotic process ioints in the mouth-around tooth sockets following the removal of teeth-or in the throat, smears of which show Vincent's organisms danger that dentists and physicians may treat these lesions without thinking of the possibility of such an underlying condition Clinically subacute leucemia may resemble typhoid fever or subacute bacterial endocarditis leucocyte count may be normal or only slightly increased, but the stained blood film shows the predominant presence of immature white cells The oxydase reaction is sometimes helpful in determining whether these cells are lymphocytic or myelocytic, although it is not practically important to make this distinction portant, however, to differentiate a number of conditions which are likely to be confused with the acute or subacute forms of leucemia must be especially on guard to differentiate acute mononucleosis and other benign infections with leucemoid reactions The milder course of such processes, the absence of destructive changes of the red blood cells and the failure to maintain consistently a preponderance of immature white cells in the blood usually permits a differentiation to be made The morbid anatomy of subacute leucemia is distinctive In the myelogenous form there is myeloid metaplasia of the spleen, bone-marrow, liver, and lymph-nodes, with occasionally infiltration of the kidneys, lungs, and heart In the lymphatic form the histological changes differ, particularly in the spleen, where there is overgrowth of follicles at the expense of pulp —the opposite of the myelogenous form

Treatment of Menstrual Dysfunction—K. Fleischer and O Hirsh-Tabor devote an article to the action of tartrate of papaverine and yohimbine on the anomalies of menstruation

with special emphasis on dysmenorrhea. The authors have worked for a number of years in this direction and the above substance gives better results than any other tested The idea of volumbine in this connection is suggested, of course, by the value of the alkaloid in ovarian insufficiency, especially in veterinary prac-Papaverine, on the other hand, is an fice antispasmodic against uterine contraction, and the combination with volumbine reduces its toxicity Not satisfied with the combination for all patients, the authors have a second formula in which to the double salt is added amidopyrine, the full name of which is dimethylaminoantipyrine, which is also an analgesic and antispasmodic to smooth muscle From the numerous case histories appended it is evident that the authors rely principally on the second formula when pain is marked, or in other words, in dysmenorrhea, while the double tartrate is used in cases of simple hormonal deficiency when plain yohimbine has proved inactive The need for a second formula is probably a commercial one, for the double tartrate, being a definite chemical substance, could hardly be marketed under a special name, hence the necessity of a mixture which can be sold under a trademark name. It does not appear that this combination has any superiority over the double salt]—Deutsche medizinische Wochenschrift, March 23, 1928

Surgical Treatment of Hyperidrosis —W Braeucker of the Hamburg-Eppendorf Hospital discusses this subject in monographic fashion, largely from the experimental and speculative angles Evidence is cited to show that the nerves which preside over the function of the sweat glands are members of the sympathetic system exclusively. The article is based largely on the history of a single case occurring in a man of 21 years, with marked hyperidrosis of the hands and feet. This tendency was aggravated in various ways and interfered with the livelihood and earning capacity On searching through the literature the writer found that in a few cases resection of the cervical sympathetic, whether intentionally or not, had the effect of checking the undue secretion In other instances, however, such a result was not in evidence. The author reasoned that a periarterial sympathectomy of the brachialis would not bring about the desired result, but in place of this, and after experimental blocking of the innervation by novocaine, he decided that division of the rami communicantes was the true indicated intervention. One year ago he divided the communicating branches of the last cervical and first dorsal sympathetic on the left side, following this up by a similar division of the fourth and

MEDICAL PROGRESS

Clinical Significance of the Lymphatic Throat Ring - J Beck discusses the physiology, pathology, and clinical importance of the so-called Waldeyer ring, referring to the studies of Groll on war material, presumably healthy and vigorous, from which it appeared that hypertrophy of the tonsils, etc, might be regarded as almost normal In opposition to this, however, it might be urged that military privations and hardships played some part in this state of affairs The material in question was from autopsies Theories as to the function of the tonsils are diametrically opposed masmuch as some attribute to them protective functions while others regard them as inviting the lodgment of hostile germs. It is claimed and denied that the tonsils have an internal The number of infectious diseases which have been accused of entering the system through the tonsils is appalling and seems to be increasing continually as new disease pictures are isolated-septic sore throat, monocytic angina, agranulocytous angina, etc Extirpation of the tonsils is called by some salutary, by others mischievous and perhaps dangerous, although it is, of course, conceded that certain tonsils should come out Here belong those which are subject to continually recurring angina In recent years, as part of the doctrine of focal infection, removal of infected tonsils is urged in all cases of incipient nephritis, endocarditis, etc Tonsillectomy has been called a prophylactic against recurrence when the symptoms have become silent Opponents of tonsillectomy are in a minority, the author maintains, and he says that none has ever been able to prove that loss of the tonsils has damaged the patient -Munchener medizimsche Wochenschrift, March 30, 1928

Tumor of the Intrascapular Gland --- Mark S Reuben and Aaron R Peskin (Archives of Pediatrics, April, 1928, xlv, 4) discuss the correspondence of the intrascapular gland to two organs of other mammals one the so-called "hibernating gland" or fat organ, and the other the so-called "hemolymph gland" The only references in the literature to tumor of the intrascapular gland are two cases reported by Inglis in the British Journal of Anatomy, June, 1927, and a description of a pathological specimen presented before the British Medical Association in 1921 The authors' case was that of an infant, aged 4 weeks, who at birth showed three large cystic masses, located respectively in the cervical region, in the right axilla, and over the sternum There were also hard glan-

dular masses in the region of the axilla and The masses were in no may connected with the deeper tissues They were cyanotic in hue and could be easily compressed. The mass over the chest was aspirated and 5 c c of clear straw-colored fluid was removed fluid subsequently reaccumulated and the cyst was extirpated The cyst wall was very thin The pathologist's report showed that it was probably made up of muscle and fibrous tissue arranged in lamellæ, as ordinarily seen in the walls of blood vessels and cysts There was no epithelial lining The diagnosis was cavernous angioma Later the article of Inglis came to the writers' notice. In this article three types of intrascapular cysts are described (1) those with thin walls and clear fluid contents, (2) those with thin or slightly thickened walls, containing almost pure blood or blood-stained fluid in which is fibrin clot, and (3) those with thick, canary-yellow, semifluid contents presence of the three types of structures and the location of the tumor masses in the case here reported leave no doubt as to the diag-

Hemocidal Properties of Blood Serum with Special Reference to Pernicious Anemia.-O H Horrall and T E Buchman state that notwithstanding the fact that increased destruction of blood in pernicious anemia was demonstrated over thirty years ago by Hunter, a careful search of the literature shows that a direct destructive action of the blood serum upon the red corpuscles has not heretofore been demonstrated They describe the technique by which they tested the hemolysis and destruction of the red cells in the serum of normal persons and of those with acute hemorrhage, secondary anemia, hemolytic jaundice, pernicious anemia, and polycythemia From their findings they conclude that under certain conditions there are hemolytic substances in the blood serum The unknown substances act in vitro and may also act in the blood stream on the red cells The increased hemolysis in relapsing pernicious anemia is more prominent when the process is on the decline and less when on the incline to recovery It would seem from this that some toxic or hemolytic substance is present, but that this agent is transitory In pernicious anemia during remission the curves for hemolysis are normal, with slight variations for individual cases, depending upon the stage of remission The serum in hemolytic jaundice and septic anemia also contains a hemolytic substance In polycythemia, aplastic

anemia, and secondary anemia the red cells are abnormal In polycythemia a portion of the cells are very resistant, while some cells are slightly more fragile than normal Reticulated red cells of normal size are more resistant than the nonreticulated This test is of value in the differential diagnosis of anemia and for determining the resistance of the red cells and the hemolytic power of the serum—Archives of Internal Medicine, April 15, 1928, xli, 4

A Consideration of Leucemia, with Special Reference to a Subacute Form -Baxter L Crawford and Edward Weiss, writing in the American Journal of the Medical Sciences, May, 1928, clav, 5, describe a form of leucemia which runs a subacute course, rather than the short course characteristic of the acute form Usually the onset is insidious, with progressive loss of strength, increasing pallor, slight fever and perhaps fleeting pains in the muscles or joints Frequently there is a necrotic process in the mouth—around tooth sockets following the removal of teeth-or in the throat, smears of which show Vincent's organisms danger that dentists and physicians may treat these lesions without thinking of the possibility of such an underlying condition Clinically subacute leucemia may resemble typhoid fever or subacute bacterial endocarditis. The total leucocyte count may be normal or only slightly increased, but the stained blood film shows the predominant presence of immature white cells The oxydase reaction is sometimes helpful in determining whether these cells are lymphocytic or myelocytic, although it is not practically important to make this distinction. It is important, however, to differentiate a number of conditions which are likely to be confused with the acute or subacute forms of leucemia One must be especially on guard to differentiate acute mononucleosis and other benign infections with leucemoid reactions The milder course of such processes, the absence of destructive changes of the red blood cells and the failure to maintain consistently a preponderance of immature white cells in the blood usually permits a differentiation to be made The morbid anatomy of subacute leucemia is distinctive In the myelogenous form there is myeloid metaplasia of the spleen, bone-marrow, liver, and lymph-nodes, with occasionally infiltration of the kidneys, lungs, and heart In the lymphatic form the histological changes differ, particularly in the spleen, where there is overgrowth of follicles at the expense of pulp -the opposite of the myelogenous form

Treatment of Menstrual Dysfunction—K. Fleischer and O Hirsh-Tabor devote an article to the action of tartrate of papaverine and yohimbine on the anomalies of menstruation

with special emphasis on dysmenorrhea The authors have worked for a number of years in this direction and the above substance gives better results than any other tested The idea of yohimbine in this connection is suggested, of course, by the value of the alkaloid in ovarian insufficiency, especially in veterinary prac-Papaverine, on the other hand, is an antispasmodic against uterine contraction, and the combination with yohimbine reduces its toxicity Not satisfied with the combination for all patients, the authors have a second formula in which to the double salt is added amidopyrine, the full name of which is dimethylaminoantipyrine, which is also an analgesic and antispasmodic to smooth muscle From the numerous case histories appended it is evident that the authors rely principally on the second formula when pain is marked, or in other words, in dysmenorrhea, while the double tartrate is used in cases of simple hormonal deficiency when plain volumbine has proved inactive [The need for a second formula is probably a commercial one, for the double tartrate, being a definite chemical substance, could hardly be marketed under a special name, hence the necessity of a mixture which can be sold under a trademark name. It does not appear that this combination has any superiority over the double salt]-Deutsche medizinische Wochenschrift, March 23, 1928

Surgical Treatment of Hyperidrosis --- W Braeucker of the Hamburg-Eppendorf Hospital discusses this subject in monographic fashion, largely from the experimental and speculative angles Evidence is cited to show that the nerves which preside over the function of the sweat glands are members of the sympathetic system exclusively The article is based largely on the history of a single case occurring in a man of 21 years, with marked hyperidrosis of the hands and feet. This tendency was aggravated in various ways and interfered with the livelihood and earning capac-On searching through the literature the writer found that in a few cases resection of the cervical sympathetic, whether intentionally or not, had the effect of checking the undue secretion In other instances, however, such a result was not in evidence. The author reasoned that a periarterial sympathectomy of the brachialis would not bring about the desired result, but in place of this, and after experimental blocking of the innervation by novocaine, he decided that division of the rami communicantes was the true indicated intervention One year ago he divided the communicating branches of the last cervical and first dorsal sympathetic on the left side, following this up by a similar division of the fourth and was most satisfactory Incidentally he and that it was still possible to obtain a secretory effect from the exhibition of pilocarpine, which fact should revolutionize our knowledge of the activity of this alkaloid. It would appear that the great effort of the author in this direction is more in the direction of an advance of our knowledge of physiology than in any great achievement in surgery—Klimsche Wochenschrift, April 8, 1928

Family Gaucher's Disease -R Mühsam adds a double case to the 40 recorded in Pick's monograph on Gaucher's disease, in 10 of which there were other cases in the family Nineteen patients were subjected to operation author's cases were in brother and sister The brother had had his spleen removed under the erroneous diagnosis of hemolytic jaundice The sister, who presented the same picture, was about to have her spleen removed under the same diagnosis It was Christeller who made the correct diagnosis from smears and sections of the extirpated spleen of the brother which showed the presence of Gaucher cells The most pronounced family incidence is found in Pick's book-4 cases in 5 children of the The apparent extreme infresame family quency of Gaucher's disease is responsible for erroneous diagnoses. In this affection there are a yellow-brown tint, notable enlargement of liver and spleen, and abnormal blood picture—a syndrome which is presented by various other maladies, notably Banti's disease and hemolytic icterus. The author's male patient did well after his splenectomy sister's case, with the organ very large and adherent, a preliminary double ligation and division of the splenic artery had been practiced but splenectomy was reserved as a last The author makes no reference to the methods of biopsy which are being tested in some clinics, in the liver and, we believe, the spleen as well Apparently it should be an easy matter to subject the splenic pulp to a biopsy, when the Gaucher cells could hardly escape recognition -Deutsche medizinische Wochenschrift, April 6, 1928

Headache in Children.—R C Lightwood, writing in the Lancet, April 14, 1928, ccxiv, 5459, states that headache in children under the age of 5 years is infrequent. It can be recognized in infants only by the signs it produces—putting the hands to the head and scratching and rubbing it. Earache is by far the commonest cause of these signs. In infancy true headache may be caused by meningitis, intracranial tumor, and hydrocephalus. In children past the age of infancy eyestrain is the commonest single cause of headache.

prolonged over a period of more than a few days Toxic headache may be produced by any of the acute infectious diseases. It seldom occurs with a temperature of less than 104°F, its presence with a temperature of 100° or 101° should cause suspicion of tuberculous meningitis The two main varieties of juvenile headache are due to digestive disturbances and juvenile rheumatism digestive disturbance may be dietetic, or it may be secondary to infections of the upper respiratory tract, being produced by the swallowed secretions of chronically infected tonsils and adenoids Headache due to juvenile rheumatism occurs in children of the hospital class above the age of 6 years, and usually in theearly part of the day Symptomatic treatment is seldom required provided attention is given to the underlying condition Migraine in childhood is often manifested by cyclic vomit-A large majority of the recurrent bilious attacks accompanied by headache fall into the group of acetonemic vomiting, and for these the daily addition of glucose to the diet will almost invariably be an entirely satisfactory prophylactic measure Younger children should have a teaspoonful of commercial liquid glucose three times a day, older children double this amount Endocrine disturbances may cause persistent headache in a certain small group of overgrown obese children The treatment of such is most difficult Antipyrine, aspirin or the bromides may be tried, or the following mixture Antipyrine, 5 grains, sodium bromide, 5 grains, glycerin, 30 minims, camphor water, to make ½ ounce, to be taken three times a day Other causes of headache are adenoids in 50 per cent of all patients requiring operation, dental caries, and occasionally uremia, nephritis, anemia, trauma, and lead poisoning Sinusitis is a highly exceptional cause in children

Sublingual Phlegmon Primary and Secondary Ludwig's Angina -Writing in the Annals of Surgery, May, 1928, lexxvii, 5, William P Van Wagenen and Clarence V Costello call attention to the fact that sublingual phlegmon, which is the dominating symptom of primary or classical Ludwig's angina, is also seen as the outstanding feature of another group of infections about the neck which have been erroneously grouped with Ludwig's angina on the strength of possessing this one symptom The confusion this has created has led the authors to set these latter cases apart under the name of secondary Ludwig's angina cases differ from the primary or classical type of this disease, in that (a) the sublingual phlegmon is secondary to lymph-gland infection and cervical abscess rather than to an infection of the cellular tissues about the Immph-glands or

submaxillary salivary gland, (b) the sublingual tissues are infected by a direct extension through the muscles which make up the floor of the mouth, the extension occurring through the loose areolar tissue about the submaxillary pland as it curls around the posterior border of the mylohyoid muscles, and (c) the sub-lingual phlegmon is to be looked upon as the peripheral manifestation of a cervical abscess or lymph-gland infection and not as an integral part of an original fulminating cellulitis as in primary Ludwig's angina The formation of ous in the sublingual tissues is the rule in primary Ludwig's angina, while it is rare in the secondary type of the disease Streptococci predominate in the former group and staphylococci in the latter. In primary Ludwig's angina extension to the larynx occurs much more frequently. The phlegmon finds its way to the side of the larynx and epiglottis by extending through the aperture between the posterior edge of the mylohyoid muscle and the middle constrictor of the pharynx. The fundamental principle of operation for both types of the disease is primarily to relieve tension and secondarily to release pus For this reason short incisions have little if any place A long, free, external incision dividing the mylohyoid muscle is essential. In the author's series of cases of primary Ludwig's angina the mortality was 25 per cent, as against 40 per cent in 104 cases collected by Thomas in 1908 and 31 per cent in 92 cases collected since that date

Leriche's Operation in Facial Paralysis -J Jianu and G Buzoianu refer to the operation as performed in peripheral traumatic facial paralysis and also append the competitive methods of other surgeons The Leriche intervention dates from 1919 when he ablated the superior cervical ganglion with the immediate result that the patient was able to close his Several surgeons who tested the operation obtained complete or nearly complete In one case at least the benefit extended to all of the facial muscles The explanation of the mechanism of cure has varied somewhat Excision of the ganglion in question is followed by some enophthalmus with narrowing of the palpebral fissure, two factors which tend alike to closure of the lids, but this does not explain the return of voluntary power Leriche has shown that such paradoxical results are not isolated and that there is an entire series of cures of this character which defy physiological explanation The ablation of the superior ganglion appears to make possible a return of muscular tone to the facial muscles, and the possibility of nerve anastomosis has also been invoked. However the problem has now become clarified by an explanation invoked by Bourguignon which involves both anatomical and physiological factors and justifies completely the procedure of Leriche. This investigator was able to show that every facial nerve gives off a twig to the eyelid of the opposite side, but that this does not function unless the sympathetic is suppressed. In the words of Leriche this explanation closes the discussion—Lyon Chirurgical, Jan-Feb., 1928

Keloidosis - Prof H Schridde seeks to show that the tendency to keloidal overgrowth in the skin may not be confined to the exterior of the body but may be present in the interior as well. He describes cases of external keloid in vaccination and other scars and in connection with acne, furunculosis, etc. these formations we see originally a granulation tissue with relatively few blood vessels, and histological study shows a peculiar feltlike arrangement of the tissue elements which consist largely of fibroblasts The author recognized the same picture in the study of stone cutter's phthisis. The tendency to form nodules leads the writer to speak of nodular In the lungs the nodular formakeloidosis tions are the result of irritation of the tissues by particles of stone Similar lesions are due to deposits of coal dust in the lungs but not in discrete nodules, for the author speaks of tumor-like masses the size of hens' eggs and larger Moreover in place of sharply markedoff lesions there is a tendency to a much more diffuse keloidosis Still here and there discrete nodules are visible. The author was next able to show that the regional lymphnodes share in this peculiarity There is nothing mysterious about this complication for the specks of stone dust or coal dust are merely taken up by the lymphatics and arrested in the nodes where they evert their irritant action The author expresses the opinion that the hard gastric ulcer (ulcus callosum) owes its peculiarities to the tendency of the subject to form keloidal granulation tissue as a response to irritation-in this case probably from the gastric juice However it must not be thought that this result is at all common, as a matter of fact it is rare and doubtless due to some peculiar predisposition which resides in the fibrous connective tissue -Klimsche Wochenschrift, March 25, 1928

LEGAL

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

THE ERA OF GOOD FEELING

The historians of President Monroe's administration refer to that epoch in our history as "the era of good feeling" The same term might be employed to describe the present state of affairs in our Society. There is a very general and sincere reciprocal feeling of regard and respect obtaining among its various members, officers and committees, and a sense of confidence that the affairs of our Society are being well administered by those who for the time being are charged with that duty

This general attitude of good feeling was never more manifest than at the annual state meeting held in Albany during the fourth week of May. The various sessions were well attended, and the business in hand was promptly and efficiently disposed of A considerable amount of work was done, not the least of which was the adoption of the amended bylaws and constitution, and the position taken with respect to the Cattaraugus matter.

Dr John Alling Card, our new Speaker, presided with dignity and ability, and demonstrated to all that the mantle of our beloved Dr E Eliot Harris, had fallen upon worthy shoulders Dr Harris was with us, and at times assisted in the carrying on of the Speaker's burdens Dr Harris leaves the office which he so long graced and honored, with the affectionate regard and esteem and appreciation of every member of the Society By a unanimous rising vote, he was made Speaker Emeritus May he long be with us to assist with his wise counsel!

The very able report of the retiring President, Dr James E Sadlier, was listened to with the keenest interest. His unusually indefatigable labors in the fulfilment of the Presidential office, together with his intimate knowledge of the affairs and problems of the medical profession, lent to all he said the air of indisputable authority. When we consider the amount of time which he expended in the performance of his multifarious tasks, in the attendance at committee meetings, and espe-

cially in his visits to the various County Societies and the District Branches, together with the constructive work accomplished, we are forced to the realization of the debt of gratitude under which he has placed every member of the Society He has set a standard which it will be difficult to approach, and perhaps im-Yet, as we look possible to improve upon forward to the new year, no one can entertain a doubt but that our new President, Dr Harry R Trick, will prove himself a worthy and honored successor, not only to Dr Sadher, but to the long line of distinguished men who have occupied the difficult and exacting position of President of the New York State Medical Society

Dr Daniel S Dougherty, our efficient and long-tried Secretary, carried on as usual the duties of his office with efficiency and dispatch, and with that sure touch which comes from a long and intimate knowledge of every detail of our organization. He was unanimously elected to succeed himself

On Tuesday evening, at the annual banquet, the delegates and their wives were instructed and entertained by the address of our distinguished Governor, the Honorable Alfred E Smith His attractive personality lent light and color to the occasion. What he had to say was to the point, and brought home to us once again that seldom if ever has the medical profession been so fortunate in having as the Chief Executive of this state, a man with a real grasp of the problems of public health and an appreciation of the necessity, not only of protecting the honorable practitioner in the rights of his calling, but of safe-guarding the laity from the blandishments of quacks, charlatans and humbugs

The delegates returned to their homes with the feeling of confidence that all was well, and with the appreciation of the able and wellplanned labors of the Committee on Arrangements

ABRASION TO BACK DURING MASTOID OPERATION

This action was brought on behalf of an infant patient against a hospital and a surgeon. As against the surgeon it was, alleged that on the 5th

of March the mother of the infant had engaged the services of the defendant surgeon to perform an operation upon the infant That the same was negligently and carelessly done. That before and while performing the operation the surgeon had allowed or permitted to be placed on the child's back bags of hot sand saturated with iodine or some other poisonous, dangerous or injurious substance, whereby the patient's back was burned As against the hospital it was charged that an agreement had been entered into between the patient's mother and the hospital, whereby the hospital was to furnish and provide the infant patient with a room and also with skilled and competent nurses, and the use of the operating room, together with anaesthetics and other articles, medicines and attendance that were necessary for the performance of the operation That the hospital in violation of this agreement, carelessly and negligently allowed and permitted careless and incompetent nurses to attend the infant plaintiff prior to, during and after the operation, and allowed or permitted one or more of its nurses to place upon the back of the infant patient bags of hot sand saturated with iodine or other poisonous, dangerous or injurious substance caus-

ing a burn to the patient's back The defendant surgeon about two years prior to the operation in question had attended the infant plaintiff at his home for a mastoid condition, at which time he had chiseled out the diseased bone, from which operation the child com-About March 1st he was pletely recovered again called to the boy's home and found him suffering from an abscess in the ear that he had operated on in the previous year. The doctor recommended that the boy be removed to the hospital, and when on March 5th the surgeon went to the hospital he found the boy on the operating Some one connected with the hospital had given the boy an anaesthesia of ether and had prepared him for the operation, so that at the time the surgeon entered the operating room the patient was fully prepared and draped for the operation. The surgeon then proceeded with the performance of a mastoidectomy Upon completing the operation the patient was put back to bed and he was left in charge of the house About two hours later the surgeon returned to the hospital, saw the boy and found him complaining of pain in the back. At that time he observed a reddened area on his back of about the size of a dollar, which area was somewhat congested He advised the application of unguentine, which was applied by a special nurse who was atending the boy The surgeon called daily on the boy and changed the dressing on his ear, observed the condition of his back and also

observed that the salve was being used for a week For the next two weeks the boy was seen by the surgeon's associate Thereafter the boy called at the surgeon's office every second day for about four weeks, the ear being dressed on these calls At the end of this time the wound in the ear had healed The back was also healing when last seen by the surgeon, but not completely healed The surgeon was paid for his operation and for his aftercare

The surgeon had at no time advised the placing of hot water bottles or any hot applications to the boy's back and did not know the cause of the reddened condition of the back. Before the surgeon began his operation the child was on the operating table completely anaesthetized and had a sand bag propped under his back. The surgeon did not examine the sand bag and did not know whether it contained hot or cold sand geon's assistant stated that he was present in the hospital when the child was operated on by the surgeon, that the orderlies had placed the boy on the table, put a sand bag prop under his back and adjusted his head so that the operation could be performed Upon completion of the operation the boy was taken back to his bed. No hot water bottles were used while the surgeon or his assistants were present. After the child had left the hospital, the surgeon's assistant attended the boy at his home for a period of about two weeks He observed the reddened area on the back and applied a salve to it. When last seen by this physician the ear had healed and the reddened area on the back had almost completely healed

The hospital attendants who prepared the operating table and the child for operation, and administered the anaesthesia, stated that no hot sand bag or one saturated with iodine or poisonous substance was used at the time of the operation upon the boy, and the cause of the abrasion on his back could not be accounted for

A physical examination showed that the boy had a circular burn over the back and right shoulder blade six inches in diameter, third degree at one or two spots, but mostly second degree, involving the full thickness of skin The scar was freely movable and permitted free and painless full motions of shoulder blade and arm abrasion and scar caused no disability, though the scar is large, pronounced and permanent

The plaintiff at the time of trial being unable to establish that the injury was due either to the negligence or carelessness of the surgeon or the hospital, a verdict resulted in favor of the defendants

CLAIMED WRONG DIAGNOSIS OF SYPHILIS

A complaint charged that the plaintiff was under the care of the defendant, as a physician and surgeon It was charged that this physician had

negligently and carelessly diagnosed the patient's condition as syphilis or other loathsome disease, when with the exercise of reasonable care he

philis or any other similar disease. The must claimed that she was rendered sick for a long period of time, and that her home life was disrupted and broken up, and she and her husband were caused to separate and live apart by reason of the alleged negligence and wrong diagnosis of the defendant physician

In the early part of July, when this patient called at the office of the defendant physician, she stated that she had been in the gynaecological ward of one of the hospitals, that after receiving treatment for some period of time, she had been discharged from the hospital

The history given the defendant physician was similar to that which she gave upon admission to the hospital, where the history record shows a female, twenty-six years of age, started to menstruate at the age of fourteen, the flow regular and moderate and every twenty-eight days, lasting four days, no clots, for the past nine years, flow has been irregular, lasting six to seven days. and the flow profuse, but no clots During the menstrual period, she would have pain in the left lower quadrant for one week previous to onset of menstruation She gave a history of pregnancies as follows First pregnancy, abortion spontaneous, two and one-half months, second pregnancy, normal, girl living, eight years, third pregnancy, normal, boy living, seven years, fourth pregnancy, normal, died at the age of one and one-half years, fifty pregnancy, normal, boy living, four years, sixth pregnancy, spontaneous abortion, four months The last menstrual period was in the middle of the preceding June, and had lasted three days with flow profuse, but no clots Operative history was an appendectomy nine years previous, and a right oophorectomy and salpingectomy a year and one-half previous

Her complaint at the time of her entrance to the hospital was pain in the left lower quadrant, general weakness, and pain circling towards the back, and then coming down along the left side The patient looked pale and emaciated

A provisional diagnosis was made of left salpingitis involving the broad ligament, and a working diagnosis of salpingitis left and gonorrhoeal infection. The final diagnosis after four days of treatment was salpingitis left and gonorrhoeal infection of left Fallopian tube. The patient was discharged from the hospital six days after her admission.

The defendant physician, after receiving this history of the patient, advised her to return to the physician who had treated her at the hospital No treatment was rendered to her at this time

A few days later, the patient again returned to the defendant physician's office, at which time he made an examination, and again referred her to the physician who had previously attended her The plaintiff, however, persisted in wanting the defendant physician to treat her, and requested that he obtain from the hospital the diagnosis that had been made of her condition while she was there At the time she called on the defendant physician, she stated that she was separated from her husband, and had been employed at the hospital to which she was admitted as a patient in the gynaecological ward She also stated that she did not intend to return to her husband, and that she herself had never done any wrong, and her trouble must have come from her husband Later, her husband called on the defendant physician at his office, declaring his innocence of any condition or any source of infection which might have been conveyed to his wife

Sometime a little later, the patient again returned to the defendant physician's office, accompanied by her father who requested that the defendant physician take care of the plaintiff. At this time, the physician again requested the patient to return to the physician who had originally attended her at the hospital, but the father of the plaintiff insisted that they wanted the defendant physician to treat her. After consenting to treat the plaintiff, she did not return again to the defendant physician, and nothing further was heard from her, no treatment or medical advice being rendered to the plaintiff by the defendant physician

After leaving the defendant physician, the plaintiff again reentered the hospital where she had been previously treated. The diagnosis made at this time was septic abortion. At the time of her admission, her temperature was 101. The patient refused to permit a Wasserman or a smear to be taken. Her recovery was uneventful, and she was discharged from the hospital five days after her entry. According to the hospital record, the patient stated that she had tried to induce abortion by sticking an alum stick into the uterus.

The action not being pressed by the plaintiff for trial, a motion was granted dismissing the complaint.

LONDON LETTER

NATIONAL HEALTH INSURANCE

A discussion in the House of Commons on a Bill amending the National Health Insurance Act of 1911 has brought out many interesting views as to the effect of the Act on the health of the Nation During the sixteen years of the operation of the Act, one has seen in England the same tendencies that have been evidenced in other countries in which Compulsory Sickness Insurance is operative In all countries, including England, there has been a tendency to include occupations which were previously excluded, and today practically the whole class of wage-earners is provided for The original idea was to supply a sum of money during incapacity, but it soon became necessary to add medical benefit and cash bene-Gradually a wide scheme has arisen covering ante- and post-natal treatment, maternity, dental and ophthalmic benefit and many ancillary activities England still lags behind in the provision of specialist treatment, and the dependents of the insured are still excluded, while as the scope of treatment obtainable under the Act is limited to that which is in the competence of a general practitioner, all advanced investigations and operative treatment are excluded, and this important part of the work depends on the willingness to co-operate of the Voluntary Hospitals—which up to now have received no financial return advanced work is well done is a tribute to the Voluntary Hospital system

From a financial standpoint, the Panel doctor has benefitted, for instance, where formerly every doctor had a number of patients who were on his "free list," he now receives a fixed sum for their treatment, and even in the country, where travelling expenses cut into his receipts, he is adequately paid

Does the patient receive an equal share of the benefit? There seems to be a difference between city and country practice. In the city, the great numbers of patients attended by Panel doctors tend to make examination superficial, and lead to delay in diagnosing the early stage of disease. It was argued in the early days of the system that the patient, having no financial liabilities, would call in the doctor at the earliest possible moment, this has not proved to be the case, and, hospital statistics would show that, for instance, in cases of acute surgical emergency, such as appendicitis, there is a longer interval now between the onset and the patient being sent to hospital than there used to be. As might be ex-

pected, there is more treatment than careful investigation and diagnosis A Panel doctor is allowed to have 2,000, and in epidemics he cannot cope with the work His prescriptions are made up by a Panel chemist, and in order to prevent "over prescribing" the schedule of drugs available is closely scrutinized, this tends to automatic prescribing of familiar compounds. In the cities, the Panel doctor has the Voluntary Hospital close at hand, and the tendency is to exploit the hospital not only for serious cases, but for minor disabilities, especially those requiring a small surgical operation Hospital accommodation is not so accessible in the country, so that the Panel doctor undertakes his own minor sur gery, which is really much to his advantage scientifically

Has the Panel system advanced the science of medicine? It is difficult to answer this question at this early stage. An enormous amount of statistical information is being collected, and if this is analyzed, facts of importance may come to light. The system is hampered by the need for specialist treatment and investigation, but this will come later.

Has the Panel system improved the health of the Nation? Again one finds difficulty in giving definite answer That the Nation's health is bet ter than it was before the introduction of the Panel system there is no doubt, but other factors have helped to bring this about Nowadays the standard of living has advanced, and the working classes are better paid, better fed, better clothed, and better housed than they have ever been Education has done much to reduce drunkenness (now rarely seen in London), and venereal disease has become much less prevalent enic conditions of the large towns have improved. so that typhoid fever, for instance, is now a rare disease, typhus is almost unknown, and tuberculosis is better under control The improvement in the Nation's health is thus due to many factors, and the part played in it by Compulsory Sickness Insurance is hard to define

A medical man (a Member of Parliament) said that the system of medical behavior as between doctor and patient has been altered. In the old days, the doctor generally was friend, helpmate and advisor and his patients trusted and obeyed him. He is now the servant of the insured population. The tone of the discussion showed that there is dissatisfaction with the present position, both on the professional and the lay sides.

NEWS NOTES

THE TRI-STATE CONFERENCE

The Ninth Tri-State Conference of the officers of the Medical Societies of Pennsylvania, New Jersey, and New York, was held on Saturday, June 2nd, in the home of the Philadelphia County Medical Society, 2046 Spruce Street Philadelphia, Pennsylvania It was opened at 10 A M with the President of the Pennsylvania State Medical Society, Dr A C Morgan, Those present from New York in the Chair State were Dr Harry Trick, President of the Medical Society of the State of New York, Dr James Sullivan, Assistant Commissioner for Higher and Professional Education of the New York State Department of Education, Dr J S Lawrence, Executive Officer of the State Medical Society, and Dr Frank Overton, Executive Editor of the New York State Journal OF MEDICINE

The subject for discussion was "Demonstrating Medical Law" The opening address was by Dr I D Metzger, President of the Pennsylvania State Board of Medical Education and Licensure Dr Metzger said that the examining and licensing of candidates for the practice of medicine was jealously guarded by the several states. The National Board of Medical Examiners tried to establish a national system of licensure, but failed to receive support because the states insisted on their own rights to regulate the practice of medicine.

The Pennsylvania Board of Examiners considers three points in licensing candidates for medical practice

- 1 Preliminary Education
- 2 Professional Education
- 3 Post Graduate Experience

The Preliminary Education that is given in literary and scientific colleges meets the requirements of the Board

The Professional Education of a candidate is that given in the medical school, and is determined by an inspection of the school and by the scholastic record of the candidate

The Post Graduate Experience required is a year's interneship by the candidate. It is with this last requirement that the Pennsylvania Board has set an unusually high standard, and in enforcing this part of the licensure, it has doubled the work of the Board in the two years of its existence

The Pennsylvania standard for interneship takes into consideration two points

- 1 The Hospital Service
- 2 The Record of the Candidate in his interneship

The Hospital is judged by three points

- 1 Equipment
- 2 The Patients
- 3 The Attending Staff of Physicians and Surgeons

Regarding Equipment, the Pennsylvania requirement is that the hospital shall have a clinical laboratory and an X-ray outfit, and that every interne shall demonstrate his ability to do good work in both laboratories

The further requirements are that the interne on laboratory service shall actually follow the cases in the wards and shall correlate his laboratory findings with those of the ward doctors

While an interne is required to work in the laboratories for two months out of his year of service, the Board of Examiners advise against his employment as a mere laboratory servant, but it requires the hospital to employ full-time laboratory technicians

After the interne has demonstrated his ability to do the technical work of making examinations and tests, he is expected to spend the major part of his time in correlating the laboratory findings with the ward records of the cases

In regard to the patients, the Pennsylvania Board requires that the interne service shall be rotational, and shall include medicine and obstetrics

The service in medical wards has proved one of the most difficult to control and secure, for many hospitals, especially the smaller ones, run to surgery and take few medical cases If a hospital is deficient in medical diseases, the interne must make it up by a service elsewhere

The organization of the Staff of a hospital is also considered by the Pennsylvania Board of Examiners Some hospitals have an over supply of chiefs of service, so that the Board of Examiners finds great difficulty in assigning the proper value to the opinion of a chief of a service. The certification of a small hospital having two or three chiefs of medical service, for example, would not be acceptable

The Board of Examiners also considers the candidate himself—his ability to work, his professional skill, and his character These qualifications are difficult to measure, especially when the hospital staffs are not well organized and the managers of the hospitals do not

understand their responsibilities in teaching the interne and supervising their records

Dr James Sullivan of New York opened the discussion He spoke of the tendency of hospitals to seek the approval of their teaching standards in order to obtain servants to run the hospital An example is that of the 139 training schools for nurses in New York State, only 60 would supply a sufficient number of nurses. Some hospitals maintained training schools, not so much for the purpose of training nurses as to secure servants to run the hospital

One danger in supervising and testing candidates is that of an over-rigidity of standards. The law of New York State lessens the severity of enforcement by permitting the regents to accept evidence of training that does not entirely conform to the rules of New York State. The Regents are permitted a certain leeway of judgment in enforcing a law

The enforcement of the law after a candidate has been licensed to practice has received a great gain by the provision of the annual registration of all physicians of New York State This registration not only offers a roll call of licensed practitioners of medicine, but it also provides the money for the enforcement of the Doctors have objected to the principle of paying a tax of \$200 a year for enforcing a law that is for the benefit not of themselves but of the people. But the Governor and the Legislators class doctors with architects, accountants, bank examiners, and other professional men who are licensed by the State They said, "The general principle of licensure is fixed and established in New York State, and those who are licensed must provide the funds for enforcement of the law of licensure cannot make an exception of doctors, much as we would like to do so"

Doctor Sullivan explained the enforcement of the Medical Practice Act of 1926 by the Regents and the Grievance Committee, and said that the enforcing officers were working quietly and efficiently, and that there had been an evodus of quacks and cultists from New York into New Jersey and Pennsylvania—in this he is confirmed by the representatives from these states

Dr Charles B Kelley, Secretary of the Board of Medical Examiners of New Jersey, said that New Jersey also requires a year of interneship as a pre-requisite of taking the examinations for the practice of medicine. It judges the hospital by four points

- 1 A questionnaire to be filled out by the hospital
- 2 An inspection of the hospital by a representative of the Board of Examiners
- 3 The report of the American Medical Association

4 The report of the American College of Surgeons

The Board of New Jersey accepts the ratnigs of Boards of other states, but the present Boards of Pennsylvania and New Jersey have inherited disputes from former Boards that had insisted on the letter rather than the spirit of the law, and these differences are now in the process of amicable adjustment

Dr Harry Trick of New York said that an interne needed to know the art as well as the science of medicine. The American College of Surgeons emphasized the manner in which the hospital practiced the art of the medical care of the patients, while Boards of Examiners emphasized the scientific aspect of the practice of medicine and the laboratory tests. Some small hospitals are giving excellent clinical care to their patients, and yet they are not acceptable to the examining boards of some states because they may lack laboratory facilities.

When internes have been highly trained in laboratory methods, and have become dependent on their help, they fear to make bedside diagnosis. Large cities are over-supplied with laboratory graduates, while rural hospitals need more laboratory facilities. A combination of clinical experience and laboratory facilities is necessary in order that a physician may practice medicine efficiently. What they need today is keen clinical observation rather than an increased laboratory experience.

Dr J S Lawrence of New York continued the line of thought suggested by Doctor Trick, and spoke of the contrast between a service in a large hospital and that in a small hospital in the developing of the confidence which the interne has in himself and in promoting the willingness to practice in rural communities where laboratory facilities are not so readily available as in large cities. He also spoke of the desire of young men to remain in large cities under the wings of specialists in order to be in money centers where large financial returns were in prospect.

Dr Henry O Reik, executive secretary of the Medical Society of New Jersey, said that the efforts of the New Jersey Medical Society to secure the passage of the Annual Registration Law had failed, largely because the legislation was opposed by the largest county medical society in New Jersey on mistaken grounds He predicted, however, that the opposition of this society would be either overcome or ignored, and that the legislation would probably be passed during this coming winter

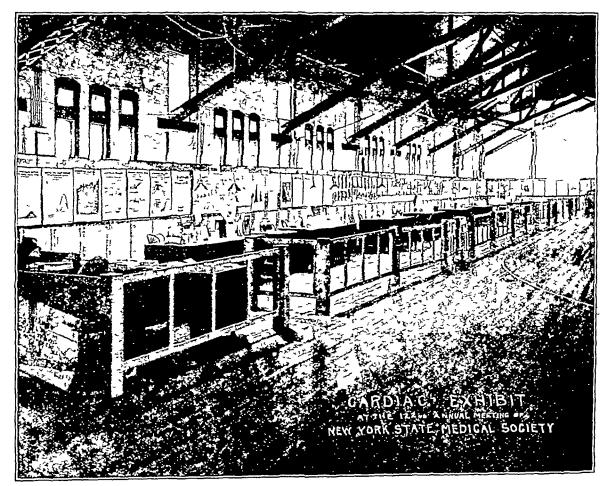

The Conference closed with a luncheon at which those in attendance were guests of the Pennsylvania State Medical Society

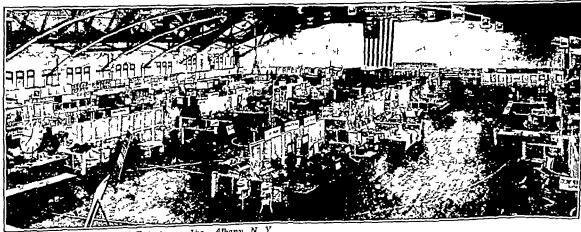

THE EXHIBITS AT THE ANNUAL MEETING

wo photographs which accompany this rele show the perfection of the arrangements for the exhibits at the annual meeting of the Medical Society of the State of New York from May 21-24

The Albany Armory was well adapted for

the exhibits, and both the scientific demonstration and the commercial exhibits were beautifully prepared But neither one was attended by the physicians to the extent that it deserved As a matter of fact, the commercial exhibits were attended even better than the

Courtesy of Barnett Maynard Enterprises, Inc. Albany, N Y
THE COMMERCIAL EXHIBIT

scientific exhibit conducted by the doctors them-

The commercial exhibitors said that they liked to attend the meetings of the Medical Society of Pennsylvania because the officers of that Society made great efforts to arouse the interests of the doctors. An announcement of the exhibit is made several times at each session of each Section and in addition special mention is made of the exhibits in which the members of a Section are interested—surgical

instruments in the Surgical Section, electrocardiograms in the Medical Section, and infantile foods in the Pediatric Section. A further feature of the Pennsylvania Society is that each Section adjourns one of its sessions earlier and its members attend the exhibits in a body and visit the booths whose wares especially apply to the members of the Section

The commercial exhibits are well worthy of serious attention and promotion by the Medi-

cal Society of the State of New York

POST GRADUATE MEDICAL STUDY IN EUROPE

NEWS NOTES

By GRACE CARSTENSEN

Executive Secretary of the Bureau of Clinical Information of the New York Academy of Medicine

It is with a much easier conscience that a physician can look forward to a long vacation, say two or three months, if he can persuade himself that most of that time is going to be spent in study. All of the capitals of Europe hold out inducements to the avid seeker of knowledge, in the way of interesting clinics and courses.

London — Suppose a traveller is landing in England In July, August and September he can find courses in medicine, surgery, and the specialties, as well as in laboratory work in any one or more of a dozen London hospitals The Fellowship of Medicine at its offices at 1 Wimpole street, in the building of the Royal Society of Medicine, is the clearing house for medical instruction in London It has affiliated to it some fifty hospitals containing six thousand beds. Of course this makes the clinical material almost These hospitals permit post graduates to attend their daily practice-ward rounds, out patient departments, operations, etc. Detailed information supplied by them is arranged in diary form by the Fellowship of Medicine, and a ticket for this "general course" is issued for any period from a week to a year at fees varying from two guineas to twenty guineas In addition to the "general course" there are special courses to the number of about sixty a year These are usually so-called "refresher courses" consisting of a fortnight's intensive work. The Secretary at the Fellowship of Medicine (Miss Mary Roy) is more than cordial and helpful to American vis-

Edinburgh —In Edinburgh there are also summer courses in various specialties —These courses are from three weeks to two months, and the fees vary according to the length of the course and to the amount of laboratory work included —The courses are in connection with the University and the School of Medicine of the Royal Colleges of Edinburgh with the offices in the "University New Building" —Places are reserved only when fees for the courses mentioned accompany the applica-

tions Students should address the secretary at the above address as promptly as possible

Of course the obstetrician would feel that his time had been wasted did he not give himself the opportunity of some work at the Rotunda in Dublin.

Glasgow.—Glasgow provides through the summer months several courses in general medicine and in surgical work, and a certain number of clinical courses. The Secretary, Dr. James Carslaw, 9 Woodside Terrace, C. 3, Glasgow, Scotland, will answer any inquiries concerning their special work. Their summer courses continue through October.

Liverpool—The most interesting work in Liverpool is of course their work in tropical The Liverpool School of Tropical Medicine, of which the Vice-Chancellor is H J W Hetherington of the University of Liverpool, is probably one of the most ably arranged that may be found Founded in 1898 by Sir Alfred Lewis Jones, its early days were full of struggle, but the Ship Builders' Association soon realized its value and necessity, and through their financial cooperation the school was finally well established It now has laboratories in various parts of the British realm and their work is of tremendous value both to scientific and to commercial Britain The University confers two diplomas, a diploma in tropical medicine and a diploma in tropical hygiene The courses for these degrees are all of about three months' duration

Paris —The Faculty of Medicine in Paris which is part of the University, has its headquarters at the Bureau des Relations Medicales, Salle Beclard, Faculté de Médecine, 12 rue de l'Academie, de Medecine All of the hospitals in Paris are under the supervision of the Faculty of Medicine, and there is no duplication of the courses The association for the Development of Medical Relations, to which belong such men as Dr Gros, Dr Heitz Boyer, Dr de Martel, Dr Armand Delille, Dr Helie, and Dr Le Mee, is organized especially with the object of encouraging foreign

Lie to Paris for post graduate work it to didactic teaching each chief of the mas it within his power to appoint as a regu-. member of his Staff one foreigner Applicants for such assistantships must send to the Dean of the Faculty of Medicine in Paris their request accompanied by copies of their credentials and by a letter of recommendation from the Dean of their own medical school Credentials are examined by a committee and submitted to the Council of the Faculty of Medicine In case of acceptance the foreign physician becomes assistant in the clinic for not less than three months nor more than a year At the conclusion of his service he receives a certificate countersigned by the Rector, and registered with the Ministry of Public Instruction

Berlin —The International Post Graduate Medical Courses in Berlin conducted by the Union of Professors and by the organizations centred in Kaiserin Friedrich-Institute are varied and valuable The courses are in various specialties pathological anatomy and other laboratory courses, internal medicine, physical therapy including roentgenology, neurology and psychiatry, pediatrics including orthopedics, gynecology and obstetrics, ophthalmology, oto-rhino-laryngology, skin, venereal, and urinary diseases, and forensic and social medicine The courses usually cover about two months, and the fees demanded vary according to the work but the usual charge is about 200 RM per month The physician travelling in Germany will do well to communicate with German organizations having their branches in this country, and who are happy to arrange for individuals or groups visiting at the various spas and other cures throughout Germany

Vienna—Vienna still retains a tradition in the minds of the medical profession, and in spite of the economic bouleversement following the world war the medical profession of Vienna still bravely holds out inducements for the foreign doctor to come there for special study. It is obvious that a nation which in the pre-war days numbered 45,000,000, and now numbers only 8,000,000, can not give the foreign visitor as much in any particular as in the days of departed grandeur. The

Wiener Medizinische Fakultät, Ring des 19, November, Universitat, prepares a program every year for post graduate work Professor Dr Leopold Arzt, the Dean of the Faculty, will give all definite information The courses cover various periods from two weeks to several months, the fees of course varying accordingly visitors in Vienna will do well to apply to the Kurs Buro of the Vienna Medical Faculty for the card of membership which entitles them to decided reductions in the way of living expenses and also does away with all customs formalities in crossing the Austrian border The American student in Vienna will also find it worth while to affiliate himself with the American Medical Association of Vienna which is situated at Alserstrasse 9

Budapest —Work in Budapest is of interest also, particularly to the urologist, while Rome, Milan, and Bologna offer valuable and interesting courses all under the supervision of the Royal Universities of those cities

International Conferences — The travelling physician will find it also well worth his while to arrange his tour in such a way as to take in the various national and international conferences, for instance the British Medical Association is to meet in Cardiff, Wales, from July 24th to 28th The International Radiological Conference will meet in Stockholm on July 23rd to 27th The International Congress of Oto-rhino-laryngologists will meet in Copenhagen on July 29th to August 1st, and the International Medical Congress for Industrial Accidents and Diseases meets in Budapest, September 3rd to 6th.

Groups of physicians may always arrange through the various travelling bureaus for special arrangements on steamships and in hotels, while there are associations of physicians organized solely for the purpose of affording their members the advantages of group accommodations

Information regarding specified clinics and courses of study in the several European centers may be had from the Bureau of Clinical Information of the New York Academy of Medicine, 2 East 103rd Street, New York City Telephone Atwater 4700

ENGLISH SPEAKING PHYSICIANS IN EUROPE

Americans traveling on the Continent are sometimes unable to secure from the management of the hotel where they are stopping the name and address of an American or English physician. All knowledge of such a physician is usually denied, but they can always supply the name of a doctor of their own nationality, who is alleged to speak English perfectly. When this doctor appears, it is only rarely that he can speak sufficient English

to make himself understood The Continental Anglo-American Medical Society commenced the publication in 1889 of a list of the American and English doctors practicing in Europe, and this list ought to be in the hands of every American going abroad A copy can be secured by any one, free of charge, by addressing a request to the Secretary, Dr Sherwood-Dunn, 54, Boulevard Victor Hugo, Nice, France

MEDICAL WARES

SNAKE BITE SERUM

The problem of dealing with the bites of venomous snakes is of increasing importance in the United States Statistics regarding the number of snake bites are meager, but in localities where some one has been interested in the subject and has become known as an authority, the number reported is surprisingly large For example, a map of the United States with a pin for every-known bite shows a dense group of pins in the vicinity of San Antonio, Texas, where Col M L Crimmins of the U S Army, has conducted extensive investigations and is known as an authority on snakes over a radius of two or three hundred miles from San Antonio Snake bites around the city are no more prevalent than elsewhere, but they are reported because the patients seek the aid of Colonel Crimmins

New York State has a surprisingly large number of snake bites every year, and the number will probably increase with the number of campers in mountainous regions, and hikers in swamps and lowlands Raymond L Ditmars, Curator of Reptiles in the New York Zoological Park, says that he "Doubts if there are any portions of the United States more abundantly supplied with venomous snakes than some areas of Massachusetts, Connecticut, New York, New Jersey, and Pennsylvania," and then he refers to their abundance in the Bronx and Palisades Parks The problem of snake bites is therefore one which concerns physicians of New York City and State

Snake bites have become of great importance on plantations in tropical countries. The United Fruit Company, for example, has been compelled to deal with the problem on its banana fields of Honduras, where the snake bite fatalities among its laborers have been high. The increase is due to several factors. Wherever men congregate, rats and mice also come, and next come the snakes which feed on the rodents. Then, too, the banana fields are covered with the banana leaves and stalks which afford excellent cover for the snakes.

Dr Afranio do Amaral, of Brazil, has been a leader in the study of reptiles and in devising practical measures for their control. He is a physician, a skilled laboratory worker in serology, and an authority on herpetology. He is director of the serological laboratory in San Paulo, Brazil, and is also a lecturer on tropical medicine in the Havard Medical School. He was the leader in organizing the Antivenin Institute of America, whose immediate object

is the promotion of the production of antivening serum for use in snake bites, but whose broader object is to promote the knowledge of venomous animals generally The Institute is intensely practical, and is a part of the Biological Laboratories of the H K. Mulford Company at Glenolden, near Philadelphia, Pennsylvania The Institute is directed by Dr Amaral, and has the support of the Harvard Medical School, the Zoological Societies of New York and other cities, and the United Fruit Company It publishes a quarterly bulletin of about thirty-two pages, containing medical and scientific articles of great interest to physicians and biologists, the first number of which appeared in March, 1927 Any physician wishing to learn the fundamental facts regarding venomous snakes and the treatment of their bites will find the information in the five numbers of the Bulletin that have already been issued

The serum against snake bites is called "Antivenin," and is produced in horses by a process similar to that of producing diphtheria antitoxin. But the venom, in addition to its specific properties, produces pathological changes in the liver and kidneys, and so the immunized horses have a life of only a few months, and are subject to sudden death in any stage of the immunization. The production of the antivenin is therefore difficult and costly

The collection of the venom to be used in the immunizations is also difficult, for people generally kill venomous snakes on sight. The Institute maintains collecting stations in the United States and Honduras and keeps a few snakes at Glenolden for experimental purposes

The venom consists of the secretion of the salivary glands of the snake The collector grasps the snake just behind its head and thrusts its fangs through a thin drumhead stretched over a beaker, and milks the venom from the gland The venom is dried in a vacuum and yields about 30 per cent of its weight as yellow crystals Each snake will produce from one-tenth to two cubic centimeters of venom, and will recuperate the supply within three or four weeks If the snake handler is bitten, he injects antivenin at once, and feels no inconvenience from the bite. Those who handle the snakes confess to a certain charm and thrill in doing something dangerous which other people do not dare to attempt The immunization of a horse is begun by the injection of a minute dose of the dried venom, and the dose is gradually

in the producture of diphtheria anti-

ativenin is marketed in syringes, each conaining a dose of ten cubic centimeters. The serum is stable, and will keep for five years without deterioration. Each dose will neutralize at least thirty milligrams of dried venom, or about one-tenth of a cubic centimeter of fresh venom. This will be sufficient for an ordinary bite, for when a snake bites, it makes only a quick strike or snap, and injects only a small portion of its venom

The antivenin is given by injections, either subcutaneously, or intramuscularly, or intravenously according to the acuteness of the symptoms following the bite. Dr. Amaral recommends that two cc be given in the area of the bite, and the remainder in any convenient situation, such as the abdomen or between the scapulae. The serum acts quickly If it is given several hours after the bite, it will show its effects within half an hour, as indicated by diminished pain and swelling at the bitten spot. If the effects of a single dose are not marked, another is to be given in an hour.

Two kinds of antivenin are produced by the Antivenin Institute

- 1 That against the North American snakes, —the rattlers and moccasins, including the copperhead which is an upland moccasin
- 2 That against the snakes of Central and South America, especially the fer-delance

The serum for the North American group has no effect on the venom of the fer-de-lance, and neither of the two affect the cobra venom The venom of each group is specific for that group

The researches of Dr Amaral have shown that the current methods of treating snake bites have been ineffective and unnecessarily cruel and crippling. He and his co-workers have issued the following directions which are printed in the Bulletin (Bulletin No. 3, Octo-

ber, 1927, page 74)

"Apply a ligature or tourniquet above the bite. This should be applied tightly at first, but must be partially released for a few seconds at five to ten minute intervals so as to maintain the necessary circulation in the limb. There is no particular advantage in making an incision nor in applying permanganate of potassium solution or crystals, or any of the other chemical agents commonly recommended for this purpose

"In fact, it is advisable to avoid any further mutilation or injury of the affected tissues, especially because, should the wound not be kept properly dressed until complete recovery, tetanus or other secondary infection might set in and complicate the patient's condition. In regard to potassium permanganate, it has been shown that, in order to have any effect on the venom, this substance must be used in concentrations that are injurious to the tissues. It has no effect in weak solution and is in itself toxic if used in strong solutions.

"Above all, avoid the use of alcohol or other stimulant of that kind. These by strengthening the circulation, may tend to help the distribution of venom throughout the body Strychnine or caffeine, however, may be used if symptoms of weakness and giddiness develop."

Dr Amaral gives additional directions for the use of the tourniquet in Bulletin No 2, July 1927, page 33, where he writes

"The tourniquet should be applied firmly

enough to prevent the flow of blood in the veins, but not tightly enough to prevent the flow through the artery. In other words, tie it tightly enough to cause the limb to become blue, but not white or blanched. The tournquet should be released for a few seconds, at intervals of ten minutes, in order to prevent gangrene of the tissue below the level of the construction.

"Remember that some of the serious results from snake bite are due more to severe, longcontinued constriction by the tourniquet than to the toxic property of the venom itself"

Man has some degree of immunity to snake bite, and often only a small amount of venom is ejected by the snake Recovery therefore usually occurs after a bite in the United States. The Hopi Indians that take part in snake dances are sometimes bitten, and in those cases the wounds are treated with a tourniquet and incisions, and in addition the Indians use, both internally and locally, an infusion made from the leaves of a plant whose identity they keep secret Experiments with the prepared infusion seem to show it is not effective for bitten guinea pigs

The response to the educational campaign of the Antivenin Institute has been surprisingly great, and a widespread interest in the subject has been manifested. The antivenin has been well distributed and has been widely used for the treatment of actual bites. There is also a constantly increasing demand for it from campers and hunters so that they may have it on hand as a form of insurance against the serious effects of possible snake bites.

Physicians of New York State will do well to advise the managers of summer camps to keep packages of antivenin for emergency use

Movie of a Man Who Thinks He's Going Blind

By BRIGGS

WHEN DOES A MAN THINK OF HIS HEALTH?

From the New York Herald Tribune May 17, 1928

DISEASE AND HISTORY

An organized study of the effect of diseases on national history is suggested in the following editorial from the *New York Herald-Tribune* of May 17

"With the fading of war's glamor into the dull realities of mud and machinery there slowly passes also war's paramount allure for the historian. Instead of the fifteen decisive battles whose stories used to occupy so sure a place among the half-dozen books on the lower shelf of the great American what-not, modern science will describe, perhaps, fifteen decisive epidemics

The first step is the decision of the American Historical Association to begin at once, in the person of Dr R H. Shryock, of Duke University, that comprehensive study of the effects of health and disease on American history which the Albert Beveridge Memorial Fund makes possible. It is a welcome decision, for of all the factors that conceivably affect the ebb and flow of national influence there is not one, perhaps, more potent than the ebb and flow of national health."

Physicians will watch for reports of the findings of the committee

VISITING NURSES

York Herald-Tribune of June 4 has acwing editorial comment on the visiting se at her best

"The finest trait of the Visiting Nurses of the Henry Street Settlement is their unstudied friend-liness. They have always made good because from the start their work has been free from the mood of patronage or condescension. In her thoughtful preface to the annual report of the settlement Miss Lilian D. Wald notes that July 1 next "will mark the thirty-fifth anniversary since Mary Brewster, my friend, and I first climbed the tenement stairs and found doors opened to us and patients behind the doors glad because we came." The last four words really tell the story of one of the best loved social agencies of New York

"Glad because we came." It is quite possible for visitors to lavish scientific skill on a household in the way of charity and still be anything but welcome. The Henry Street nurses make friends wherever they go by being friendly without a trace of affection. Their success lies in that faculty

"So also in the social activities of the settlement the 'uplift' note which can be made obnoxious if harped upon is never obtruded. The settlement leaders are convinced by experience that people have most interests in common. There surely should be a community interest and support on a generous scale for an organization whose heart beat is so strong."

Physicians welcome the visiting and public health nurse whose attitude is in accordance with the ideal expressed in the editorial.

INSANITY PLEA IN COURT

A defensive plea of insanity in criminal trials is usually a disgrace which is receiving the attention of psychiatrists and jurists. The abuse of the plea consists largely in bought testimony. The New York Herald-Tribune of June 4 comments editorially on new laws adopted by two states providing for the determination of the sanity of a prisoner before his trial, thereby avoiding the submission of the question of insanity to the judgment of a jury. The editorial reads

"In Massachusetts, under a law passed in 1921, persons accused of a capital offense and those indicted for a felony more than once are mentally examined before trial by experts of the State Department of Mental Diseases The department then files a report of its examination with the clerk of the court in which the trial is held. This report is accessible to the court, to the district attorney and to the attorney for the person accused and is admissible as evidence. The results have been highly gratifying Since the law was adopted there has been an average of less than one case a year in which alienists have been employed by the 'It has effectually stopped the defense in trials discredited practice of mental experts taking employment on either side of a capital case for large fees and has saved the state costly trials in a number of cases'

"The Colorado statute differs in detail, but is based on 'the same fundamental idea of removing the determination of the samity of the person accused from the jury and placing it in the hands

of disinterested qualified experts' The committee, after more than a year's investigation of the subject, believes that either the Colorado or the Massachusetts law marks a decided advance over present procedure elswhere and may be used as a model by other states with great advantage to society. The extremely high character of its personnel, to say nothing of the crying need for reform as demonstrated by the Remus verdict, entitles its recommendations to the prompt and earnest consideration of every state legislator"

The editorial was inspired by the report of a special committee printed in the news columns of the June 4th *Herald-Tribune*, which reads

"In a special report by the subcommittee on medical aspects of crime, made public yesterday by the National Crime Commission, 120 Broadway, it was recommended that the legal procedure in criminal trials be altered so that juries would not pass on the mental responsibility of accused persons

"Newton D Baker, chairman of the National Crime Commission, said the bewildering effect of contradictory expert testimony and the unaccountable effect of the sympathies of the jurors on verdicts recently rendered in cases in which insanity was set up as a defense was responsible for the attention given the matter by the subcommittee at this time"

Physicians of New York will welcome a law like that of Massachusetts and Colorado

®

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review as dictated by their merits, or in the interests of our readers.

- Brain and Mind or the Nervous System of Man By R. J A. Berry, M D Octavo of 608 pages, illustrated New York, The Macmillan Company, 1928 Cloth, \$800
- Practice of Medicine. A Manual for Students and Practitioners By Hughes Dayton, M D Fifth revised Edition 12mo of 340 pages Philadelphia, Lea and Febiger, 1928 Cloth, \$2.25
- A Manual of Otology By Gorham Bacon, AB, MD, and Truman Laurence Saunders, A.B., MD Eighth Edition, revised Octavo of 576 pages, illustrated Philadelphia, Lea and Febiger, 1928 Cloth, \$4.50
- Modern Methods In the Diagnosis and Treatment of Renal Disease. By Hugh McLean, MD Third Edition, revised Octavo of 135 pages, illustrated Philadelphia and New York, Lea and Febiger, 1927 Cloth, \$2.75 (Modern Medical Monographs)
- A Treatise On Diseases of the Hair and Scalp By S Dana Hubbard, MD Octavo of 500 pages, illustrated Philadelphia, Lea and Febiger, 1928 Cloth, \$5.50
- Les Associations Microbiennes Leurs Applications Thérapeutiques By Georges Papacostas and Jean Gaté, 12mo of 438 pages Paris, Gaston Doin et Cie, 1928 Paper, 20 francs
- Traité D'électrocardiographie Clinique. By Paul Veil, and Juan Codina-Altès Octavo of 447 pages, illustrated. Paris, Gaston Doin et Cie, 1928 Paper, 95 francs
- GREFFE OVARIENNE ET ACTION ENDOCRINE DE L'OVAIRE. By VITTORIO PETTINARI Octavo of 487 pages, illustrated. Paris, Gaston Doin et Cie, 1928 Paper 70 francs
- PHYSICAL DIAGNOSIS By W D Rose, M D Fifth Edition. Octavo of 819 pages with 310 illustrations St. Louis, The C. V Mosby Company, 1927 Cloth, \$10 00
- STRABISMUS Its Etiology and Treatment. By Oscar Wilkinson, A M M D Octavo of 240 pages, illustrated. St. Louis, The C V Mosby Company, 1927 Cloth, \$10 00
- GYNECOLOGY FOR NURSES By HARRY STURGEON CROSSEN, M D Octavo of 281 pages, illustrated. St. Louis, The C. V Mosby Company, 1927 Cloth, \$2.75
- LOBAR PNEUMONIA. A Roentgenological Study [A Correlation of Roentgen-Ray Findings with Clinical and Pathological Manifestations] By L R. SANTE, M D Octavo of 137 pages, illustrated New York, Paul B Hoeber, Inc., 1928 Cloth, \$300
- CLINICAL ASPECTS OF THE ELECTROCARDIOGRAM A Manual for Physicians and Students By Harold E. B Pardee, M.D Second Edition, revised. Octavo of 242 pages, with 60 illustrations New York, Paul B Hoeber, Inc., 1928 Cloth, \$5.50
- ASTHMA. Its Diagnosis and Treatment. By WILLIAM S THOMAS, M.D. Octavo of 279 pages, with 20 illustrations. New York, Paul B Hoeber, Inc., 1928.

- ALUMINUM COMPOUNDS IN FOOD Including a Digest of the Report of the Referee Board of Scientific Experts on the Influence of Almunum Compounds on the Nutrition and Health of Man By ERNEST ELLSWORTH SMITH, Ph D, M D Octavo of 378 pages New York, Paul B Hoeber, Inc., 1928 Cloth, \$700

OUR NEIGHBORS

THE OHIO ANNUAL MEETING

It is always interesting to note the opinions of the editors of State Journals regarding the annual meetings of the State Medical Socie-The first article of the June issue of the Ohio State Medical Journal says

"This meeting not only marked the 82nd annual gathering of physicians to the scientific assembly of the State Association but the twenty-fifth anniversary of the present form of organization—the establishment of councilor districts and the creation of a council as the governing body during the interim between

annual meetings

"A substantial average in attendance was maintained at this year's meetings, the registration exceeding eleven hundred, somewhat larger than any previous meeting of the Association in Cincinnati The attendance undoubtedly would have been even greater if it had not been for conflict in dates with several special scientific societies which were meeting at The rather the same time in Washington prevalent epidemic of mild influenza and other respiratory diseases also militated against a

still greater attendance

"The scholarly and masterful annual address of the retiring president, Dr L L Bigelow, of Columbus, published in full in this issue of The Journal, was a suitable final official act of this term as the leader of the medical organization in Ohio Under his leadership and during his term as president, he gave unstintingly, faithfully and ably of his time and talents to the service of the profession and Dr Bigelow's presimedical organization dency is now recorded and will be remembered as a year prominent for the clarification of issues, pronouncement of policies, solution of problems, and accomplishment of ob-1ectives

"The Annual Meeting in like measure brought to fruition the auspicious factors of harmony, co-operation and leadership, evidenced in the inauguration of Dr Charles W Stone, of Cleveland, as president for the ensuing year All signs point to a most successful year under President Stone, whose long and splendid service in various important positions in medical organization, fit him eminently for leadership His practical and inspiring inaugural address is published in this issue of The Journal

"The proceedings of the House of Delegates, elsewhere in this issue, graphically portray the effectiveness of harmony and constructive ac-

Faithful service by many committeemen, delegates and members contribute to that official record of organization achievement

"Cincinnati colleagues cordially extended hospitality to the visiting members and added much to the success of the meeting The local committees on arrangements were tireless and effective, and their thoroughness was apparent in the many well-arranged details so necessary to the satisfactory conduct of a convention of such extent and importance

"Withal the 82nd annual meeting was a pleasant and profitable occasion long to be remembered with pride by all those who contributed to its success by their participation

and attendance

"During the annual meeting in Cincinnati, the Cincinnati Enquirer, in its leading editorial on Wednesday morning, May 2, under the heading of 'The Healers' had the following complimentary comment to the State Association and its annual meeting

"The Ohio State Medical Association is the guest of the city this week The association would be very welcome for a much longer period than three days-men of science accomplish much in a brief space of time, and the

doctors are no exception to the rule

"'The world has erected many memorials and monuments honoring its nominated great, but it is to be doubted that any among them were more greatly deserving of this distinction, and the deep gratitude of the race, than the men who, representatively, have followed and served in the path pioneered by Galen and the early seekers into the mysteries of physical

"The doctor, notwithstanding the trend toward specialization, maintains a closer relation to his patient than is possible with any People hold a faith in physician or surgeon that is akin to the kind which is said to be able to move mountains And the real medical man lives up to the ideals and demands of that faith to the limit of his abilities and

resources

"'The medical association distinguishes whatever city may be selected for convention purposes, and it should not be too much to say that the city of Cincinnati, from the medical viewpoint, offers opportunities and distinctions not possible to be extended by many other communities, for Cincinnati is a veritable home of the medical science and of super-developed hospitalization Here are great schools (Continued on page 761-adv xiii)

For wasting diseases

Maltine

WITH COD LIVER OIL

—a preparation preferred by many physicians to cod liver oil alone

As a disease preventive the value of cod liver oil is firmly established. In combination with Maltine, cod liver oil is easy of administration and assimilation. And Maltine contains, in addition to mineral salts and soluble vegetable albuminoids, the essential proteid elements of barley, wheat and oats

Maltine with Cod Liver Oil is readily digested. It is a pure and dependable preparation, free from the unpalatable qualities of plain cod liver oil. When the digestive processes are weakened and nourishment is impeded, Maltine with Cod Liver Oil may be safely prescribed. As an adjunct to the dietary of infants and children, it is a food that may be generally used to advantage.

Maltine Plain	□	Maltine with Creosote	We will gladly send physician free samples of any of the Maltine products and the book let, 'The Maltine Preparations' Please check those which you desire

More Convenient— More Economical— Greater Therapeutic Range

DISTINCTIVE features make the new Battle Creek Super Solar Arc Lamp noteworthy for its safety, efficiency, economy and broad therapeutic range. The automatic magnetic feeding of the carbons insures the largest arc possible with the given current. The current is perfectly utilized, and the use of 12-inch carbons minimizes loss of time and delay.

Ease of adjustment to any desired position and the means of locking the lamp in place make this appliance most satisfactory for general use Power is variable in the Super Solar Arc. The rays may be concentrated to produce caustic effects, or toned down to reproduce mild sunlight. The combination of ultra-violet, infra-red and other light rays produces a spectrum that most nearly approaches that of natural sunlight

Solar erythema can be produced with the Battle Creek Super Solar Arc in six to eight minutes, when desirable. Occupying a minimum of space, due to its upright position, the lamp may be easily and quickly moved in adjustment to the patient

The new Super Solar Arc Lamp employs many advanced features in construction May we send you our new bulletin, completely describing this efficient appliance?

and technical libraries and specialists of world-wide fame, here have been developed principles of sanitation and surgery which have made the city a real Mecca to tireless questers after truth who fare to its schools and hospitals from every quarter of the globe. And the men of the Ohio association are not the least among those who come to visit the Aesculapian alters of the city's notable temples of science."

Regarding attendance, Ohio far and away excels New York The figures given on page 474 of the June issue of the Ohio Journal are

as follows

"A substantial average in registration was maintained at the Cincinnati annual meeting. The registration for this year was 1112 and for 1922, the last annual meeting held in Cincinnati, it was 1100. By years, the registration figures since 1920 follow 1920 at Toledo, 1062, 1921 at Columbus, 1303, 1922 at Cincinnati, 1100, 1923 at Dayton, 1414, 1924 at Cleveland, 1603, 1925 at Columbus, 1689, 1926 at Toledo, 1125, 1927 at Columbus, 1705, 1928 at Cincinnati, 1102

DR. JOHN HUNTER

The May issue of the Journal of the Michigan State Medical Society contains the following editorial on the character and work of Dr John Hunter—

This year, the fourteenth of February to be exact, marks the 200th anniversary of the birth of John Hunter Anniversaries of the birth or death of the great and near-great afford an opportunity to recall their work, which is always an advantage, for as someone has aptly said, "Destiny reserves for all repose enough" It is to be hoped that those of our readers who go to London will visit the Hunterian Museum of anatomy, one of the finest of its kind in the world Hunter supplied the nucleus of this most orderly exhibit in his collection of 13,000 specimens duly described and catalogued His capacity for work was sincerely appalling His dissections included not only human subjects, but animals as well so that the collection affords a splendid opportunity for the study of comparative anatomy He dissected and described over 500 species of animals His sleep requirements were apparently satisfied by only four or five hours, the remainder of the time was given over to his favorite work, to which he devoted almost his entire income He would have died in poverty had not the British government purchased his museum for 15,-000 pounds

NEW YORK

CHICAGO 59 E. Madison

(Continued from page 761-adv xiii)

John Hunter was in a real sense a self made anatomist and surgeon. He owed little to any formal education he had ever received, and in this respect he resembled that famous Scotch physician, Sir James MacKenzie, who was anything but precocious during his earlier years. The Hunters were Scotch on both sides of the house. His love for anatomy began at the age of twenty when he went to London to help his older brother, William, a refined and cultured gentleman, with his dissections. John's studies included particularly investigation of the lymphatic system, the veins and the placental circulation, also the nasal and olfactory nerves.

As teacher John Hunter had some unfortunate shortcomings, a diffident manner, and a bad delivery and an uncontrollable temper He was subject to angina pectoris during his latter years and he was wont to say that he was completely at the mercy of anyone who chose to make him angry He was connected with St George's Hospital as medical teacher but could not get along amicably with his A conflict with one of them brought on an anginal attack which resulted in He was a his death on October 16, 1793 scornful Ishmaelite among his professional as-He took house pupils who were bound to him for five years at 500 guineas One of his pupils was Jenner for whom Hunter formed a strong attachment

With the advent of John Hunter, says Garrison, surgery ceased to be regarded as a mere technical mode of treatment and began to take its place as a branch of scientific medicine firmly grounded upon physiology and pathol-He was the founder of experimental and surgical pathology He made important studies on the repair of tendons using as an example a ruptured tendo achilles sustained by himself in Among his studies on surgical an accident pathology we have shock, phlebitis, pyemia, inflammation and surgical diseases of the vascular system Greater enthusiasm hath no man than this, having accidentally inoculated himself with syphilis, he delayed treatment that he might study the course of the disease on He described the hard chancre, and hımself differentiated the Hunterian chancre from the chancroid ulcer, but strange to say confused syphilis and gonorrhea His defective education served to protect him from the aberrations of many of his predecessors whom he His lack of historical perhad never read spective however, caused him to come to many wrong conclusions Yet he has been classed with Pare and Lister in the trio of the greatest surgeons of the time"

THE CANCER PROBLEM

Medical Societies are conducting campaigns for educating the public regarding cancer. They are also educating physicians regarding the proper course to take when cancer is suspected. The June issue of Colorado Medicine contains a brief article on teaching suggestions in the cancer problem from which the following extracts are taken.

"The long-standing tumor in the breast that has without apparent provocation changed in character, with adherent or ulcerated skin, with retracted nipple, with distinctly enlarged or palpable axillary glands and moderate cachexia, is undoubtedly malignant. This is the fully developed lesion (not early) all too frequently presented by the patient to the surgeon He recognizes the dubious prognosis even with a most radical removal. The physician, true to his teaching, has watched and waited until an exact diagnosis could be made This watchful waiting principle should be changed to one of aggression, attacking and removing the lesion before a positive picture of even early malig-We should nancy has a chance to develop operate not to remove cancer but to prevent its possibility

"The medical student of today should be forcefully impressed with the fact that every tumor, cyst or nodule in the breast is poten-Every such lesion is pritially malignant marily surgical though not necessarily immediately operative. Such lesions are abnormal in character, are prone to irritation, and irritation frequently repeated is commonly accompanied by or leads to changes that sooner or later become malignant within the lesion itself or in the immediately surrounding tissues It is not advisable to wait for such changes Waiting can only increase before operating the hazard to the patient and the magnitude of the operation

"Early cancer cannot by any method which we now possess be diagnosed with even a slight degree of certainty The teaching should be to remove all such lesions before they present characteristics of certain malignancy. The maximum results will be attained when we no longer see fully developed cancers

"If we continue to teach the diagnostic features of positive malignancy our students will wait until these signs are present before acting. Watching for the transition from a benign or doubtful lesion to that of a positive malignant one is wrong. We compromise the chances of curing the patient by this very certainty. It were far better to be less considerate of our diagnostic acumen and more considerate of the patient's welfare.

RABIES PROPHYLAXIS

Dr M J Rosenan has an article on the treatment of dog bites and the prevention of rabies in the May 31st issue of the New England Journal of Medicine He says that strong nitric acid used to cauterize a bite is almost sure to prevent rabies

Regarding the injection of preventive doses of

attenuated virus Dr Rosenau says

"It is sometimes difficult to decide whether the prophylactic treatment should be given ment causes sufficient personal inconvenience, not to speak of the danger (however slight) of paralysis, to avoid advising it if unnecessary In many cases it is impossible to discover whether the dog that inflicted the bite is mad or not. The rule in cases of doubtful exposure is to advise the treat-

Persons who apply for treatment of dog bites fall into one of the seven following categories with reference to the Pasteur prophylactic or one of its modifications, such as the Semple method

1 The dog is mad In this case, begin treatment at once

2 The dog shows suggestive symptoms Give the treatment at once In communities having skilled laboratory facilities wait for diagnosis, provided this is done promptly

3 The dog is not mad Observe it carefully for ten days and if no symptoms develop there is no danger of rabies in the person bitten treatment is therefore unnecessary. The dog may nevertheless develop rabies after ten days, and if it has been bitten by another dog it should be kept in quarantine for six months

4 The dog is not identified. This is a common occurrence, especially with children The rule in such cases is to advise the prophylactic treatment, except in regions known to be free of rabies

5 Exposure to saliva Persons not infrequently apply for advice giving the following history They have not been bitten, but they have been licked on the hands and face by a dog that subsequently was discovered to have the disease Persons are sometimes similarly exposed by washing the mouth of a rabid horse. In these cases the important question is whether there were fissures or abrasions in the skin at the time There may be little wounds in the skin not evident to the It is possible to infect animals by rubbing the virus on the shaved skin The rule is therefore to advise the protection which the treatment affords in persons thus exposed

Convenient, uniform and more accurate than tincture drops

Prescribe "original bottle of 35 pills" which protects the contents from exposure from the time of manufacture to the time of administration. This further insures dependability of action.

Each pill contains 0.1 gram, the equivalent of about 1½ grains of the leaf, or 15 minims of the tineture Sample and literature upon request.

DAVIES, ROSE & CO, Ltd Pharmaceut cal Manufacturers, BOSTON, MASS

(Continued from page 765-adv xvn)

6 In psychoneurotic patients with a distressing phobia of rabies, it may afford comfort to give mild course of treatment as much for its psychotherapeutic effect as for specific immunity

7 Fomites The question is often asked whether the disease may not be contracted from contact with virus in saliva upon floors, on play things and other objects. The situation arise with a rabid dog in the house, where children may be exposed in this indirect manner. While theo retically possible, the danger is small, in fact, I have never heard of a case contracted in any such way.

The virus is not infective by the mouth

THE WRONG SERUM

It is not often that the New England Journal of Medicine, the worthy successor of the Boston Medical and Surgical Journal, indulges in irony, but it was justified in doing so in regard to the flight of an aviator to Montreal in order to carry antipneumonia serum to Floyd Bennett The May issue says editorially

"The mind that conceived a tabloid press judged with accuracy the type of mental pabulum most suited to the average intelligence. The public wants its meat well seasoned and its pudding smothered in sauce, perhaps to be abreast of the times one should say applesauce. The temperate account of an epochal advance in medical science leaves it cold, but it thrills to the broadcasting by radio of an appeal for a blood donor, and erects monuments to the dog that helped bring antitoxin to Nome

"Particularly objectionable to our mind is the cheap and vulgar desire for publicity which inspired the recent flight to Quebec with a pneumoma serum of exceedingly questionable value in the case for which it was intended We read with sorrow of Floyd Bennett's illness We knew him to be a skilled and intrepid aviator, deserving of sympathy in his sudden affliction, and of necessity doomed to a considerable degree of objectionable We knew that he was ill with pneumonia and that his fate was on the knees of the gods We heard with passing interest of the departure of a specialist from New York It was comparatively late in the course of the pneumonia that he must have arrived in Quebec, and both Quebec and Montreal and every city in Canada has physicians who are capable of directing the care of pneumonia patients, even to the use of the

"We began to sit up and take notice, however, when, on about the fourth or fifth day of the disease a frantic call was sent to New York for pneumonia serum. The machinery of the Guggenheim

(Continued on page 767-adv xir)

(Continued from page 766-adv xviii)

Foundation had been set in motion, and it engaged accurately, if noisily, with that of the Rockefeller Institute. The stage was set. Motorcycle police cleared the streets of New York for the precious fluid which was being rushed to the flying field where an aviator of international fame nervously paced the ground with motor tuned up and propellor turning, ready for the take off. The public was getting what it loved—serum and applesauce. The dramatic climax of the situation occurred in Quebec a few hours later. Nothing could have been more perfect from an artistic standpoint. It was the wrong serum

"Despite the great advances in aviation, it is not yet entirely a safe means of transportation. Every aviator takes his life in his hands when he flies. Lindbergh, entirely ignorant, we believe, of the gigantic hoax in which he was being made a dupe, was exploited, at the risk of his personal safety, for the purposes of publicity. The stage setting, however, was too perfect, even now the boomerang is returning, the more conservative newspapers are realizing that they and the public have

had one put over on them"

UNDULANT FEVER

Undulant or Malta fever is becoming prevalent throughout the United States

The June issue of the Nebraska State Medical Journal says editorially

"Cases of malta fever or undulant fever have been reported during the past winter from Iowa and at least one case is reported from Nebraska (See its Journal, May, 1928, p. 173) It is also called Mediterranean fever, having been first described from that region, Gibraltar fever, Neapolitan fever, Bruce's septicemia, goat fever, rock fever, etc. It is a fever of bacterial origin due to the Micrococcus melitensis, first isolated by Bruce in 1893

The fever is characterized by its long undulatory course, early arthritic symptoms,

sweats and increasing anemia

The goat is the natural host of the organism, but it is also found in ewes, cows, asses, horses and monkeys. The infected animals appear to suffer no inconvenience whatever from the presence of the germ. The disease is conveyed to man by goats and especially by their milk, for it is prevalent in exactly those regions where goat's milk is a common article of diet.

Its transmission to man is through the alimentary canal and is a true septicemia

The period of incubation is from ten to fourteen days. The onset is characterized by chills, malaise, cephalalgia, anorexia, muscular pains, insomnia and depression.

The fever which ranges from 103 to 105 degrees persists for about two weeks, then declines to normal by lysis in about two weeks, only to rise again after a few days. This proc

Simplified Lactic Acid Milk Feeding

In addition to Lactic Acid Milk Merrell-Soule offers.

KLIM POWDERED WHOLE MILK

-whole milk to which nothing has been added and from which only the water content has been removed It is uniform as to composition—low in bacterial count—safe and practical for infant feeding

POWDERED PROTEIN MILK

This is the dehydrated equivalent of Finkelstein's original Liweissmilch Sustained pediatric recognition and approval testify to the fact that Merzell Soule Powdered Protein Milk has a definite place in infant feeding

(Recognizing the importance of scientific control all contact with the lasty is predicated on the policy that Lactic Acid Milk and its allied products be used in infant feeding only according to a physician s formula.)

REALIZING the desirability, from the pediatrician's view-point, of scientific simplification in infant feeding, Merrell-Soule Powdered Whole Lactic Acid Milk is offered with claims that—

—it represents the simplest and quickest method of preparing Lactic Acid Milk feedings

—it is absolutely uniform Published analyses are strictly adhered to

—its precurdled casein forms in fine floccules Blockage of the nipple holes cannot occur

—Bacillus Bulgaricus is retained in a viable condition, thus enhancing its therapeutic value

The need for a fine curd in Milk is answered by Merrell-Soule Powdered Whole Lactic Acid milk, for the fine curd is inherent in the product.

6 In psychoneurotic patients with a distressing phobia of rabies, it may afford comfort to give a mild course of treatment as much for its psychotherapeutic effect as for specific immunity

7 Fomites The question is often asked whether the disease may not be contracted from contact with virus in saliva upon floors, on play-The situation arises things and other objects with a rabid dog in the house, where children may be exposed in this indirect manner While theoretically possible, the danger is small, in fact, I have never heard of a case contracted in any such

The virus is not infective by the mouth

THE WRONG SERUM

It is not often that the New England Journal of Medicine, the worthy successor of the Boston Medical and Surgical Journal, indulges in irony, but it was justified in doing so in regard to the flight of an aviator to Montreal in order to carry antipneumonia serum to Floyd Ben-The May issue says editorially

"The mind that conceived a tabloid press judged with accuracy the type of mental pabulum most suited to the average intelligence The public wants its meat well seasoned and its pudding smothered in sauce, perhaps to be abreast of the times one should say applesauce. The temperate account of an epochal advance in medical science leaves it cold, but it thrills to the broadcasting by radio of an appeal for a blood donor, and erects monuments to the dog that helped bring antitoxin to Nome

"Particularly objectionable to our mind is the cheap and vulgar desire for publicity which inspired the recent flight to Quebec with a pneumonia serum of exceedingly questionable value in We read with the case for which it was intended sorrow of Floyd Bennett's illness We knew him to be a skilled and intrepid aviator, deserving of sympathy in his sudden affliction, and of necessity doomed to a considerable degree of objectionable We knew that he was ill with pneumonia and that his fate was on the knees of the gods We heard with passing interest of the departure of a specialist from New York. It was comparatively late in the course of the pneumonia that he must have arrived in Quebec, and both Quebec and Montreal and every city in Canada has physicians who are capable of directing the care of pneumonia patients, even to the use of the oxygen tent

"We began to sit up and take notice, however, when, on about the fourth or fifth day of the disease a frantic call was sent to New York for pneumonia serum The machinery of the Guggenheim

MALPRACTICE SUITS

The May issue of the Atlantic Medical Journal contains an editorial in which the editor quotes from a series of confessions of an ambulance chaser printed in the Philadelphia Evening Bulletin in which he states

"The family physician is exceedingly difficult to handle in the upbuilding of a case, for he invariably insists upon sticking to cold facts as he sees them, whether he helps or harms the case It is very awkward, I assure you, when the bought-andpaid-for opinions of a specialist are ready to soar to the higher altitudes of pure speculation, to have the family physician complacently testify that the patient has entirely recovered from the effects of the injury The trouble isn't so much that these family physicians subscribe to the ethics of their professions, as it is that they will persist in living up to them I don't know that anything can be done about it, but the 'big boys' in the racket look with some concern on their attıtude

"The second classification, the specialist, requires less comment He will swear either way to a given situation, depending upon who retains his services, and guarantee a satisfactory job, provided he feels sure of his check

"The last group, the whathave-you crowd, are our own people, the shock troops of the medical profession, the up-andat-'em boys who don't mind in the least the smell of the racket Perhaps I should confess to a feeling of sentimental comradeship toward these allies, and perhaps I would, were it not for the fact that it is a purely business relation in which nobody trusts

"With the aid of this last school of physicians, we are enabled to accomplish some very wonderful results that make interesting reading when the defendant's check reaches our perspiring hands. Then, of course,

anyone else, and every fellow

keeps his eye out for himself

comes the melancholy task of paying off A part of the recovery, never more than half, and sometimes less, goes to the star of the cast, the victim He may feel a little disappointment, but at least he now can discard his crutches and bandages and go back to the daily grind firm then takes a modest cut of perhaps 40 per cent for its mental anguish, the remainder being distributed among the small army of helpers who labored so faithfully to work the gravy boat into a snug harbor'

LIGHT THERAPY IN ZOO-LOGICAL GARDENS

The London letter printed in the May issue of the Journal of the American Medical Association contains the following account of the effects of ultraviolet light on the animals of the Zoo

"The attempts of the directors of the London Zoological Gardens to supply a substitute for the meager dole of sunlight of the London winters have now been practiced long enough to justify conclusions Wherever ordinary window glass has been replaced by vitaglass the health of the animals, whether large carnivores, monkeys or reptiles, has improved On the other hand, the use of incandescent globes of fused quartz, from which much was expected, is found to require extreme care and to belong to therapeutics rather than to hygiene The slightest over-exposure of reptiles appears to be injurious A young elephant treated for rickets showed severe injury to the skin from exposure which would have been regarded as harmless for human But in the cloudy days and long nights of an English winter and in dull weather at other times when the ultra-violet rays are filtered out of sunlight, an extraneous source is necessary This is suppled sufficiently by ordinary electric lights if they are really powerful"

some observers

THE KENTUCKY STATE MEDICAL ASSOCIATION

The May issue of the Kentucky Medical Join nal says editorially

"The affairs of the Kentucky State Medica Association are your business. Unless you dues have been paid to your county secretar this is the last issue of the Journal which wi reach you until they are paid. It is difficult to understand why it is necessary to say this each year to doctors who are members of all sort of fraternal organizations, who carry insurfance policies, who pay taxes and who know that the law requires corporations to conduct themselves so they are able to make definite reports of income along business lines.

"Thoroughly conversant with the management of other State Medical associations we know that ours is conducted on an effective No other association gets the same amount of service for as little cost. The publication of the Journal alone costs more than each member pays Of course, our advertisers make up the difference Last year our Medico-Legal affairs cost half of the income from the membership We trust this was an unusual year but we feel sure that the members who received the benefits from the excellent work of the Medico-Legal Committee are not disposed to be critical of this splen-Suits have been brought against did work some of the very best men in the State Practically every one of them has been entirely without justification, but the defense of a malpractice suit, however unjust to an individual, rarely costs him less than \$1,000, while the Association, through the splendid management of Mr Forcht, has managed these cases for an average of a fourth of this amount. It is a curious commentary on our court system that the cases which have been decided adversely have been among the least meritorious, as a matter of fact

"The profession needs to maintain its organization on a highly effective basis now as never before—It needs the really thoughtful consideration of all of its members in helping to solve the tremendous problems that con-

front it'

THE AFTERMATH OF HEAD INJURIES*

By JOHN L ECKEL, MD, BUFFALO, NY

HE subject of this discussion is one very frequently met with by all physicians and surgeons coming in contact with conditions alleged to result from trauma to the head

With the constant endeavor for more efficiency and greater speed, not only in the industries but in civil life as well, and with the ever increasing means for greater speed in transit, it is not strange that we should frequently meet with trauma of all types perience and statistics seem to indicate that about fifteen percent of injuries in which compensation is applied for are to some portion of the nervous system, and that a fair proportion of these claim some head injury possible causal relationship between the trauma and the development of organic and so-called functional nervous disease is a difficult one, but one of great importance and one in which most physicians are frequently called upon to express an opinion The importance of this can best be grasped when we but look through our court calendars and see the tremendous number of cases of alleged nervous injury resulting in litigation The amount of money paid annually in compensation and in litigation in these cases is enormous, and the sad part is that the number of litigants is constantly increasing Apparently no case is too trivial for a certain class of legal men to accept as a form of speculation and to proceed to capitalize the infirmities of the individual is very impressive at times to quietly observe the ingenuity with which some of these smaller cases are developed into huge ones

Another very important factor in the ever increasing number of these cases is the great variety of opinion and not infrequently the conflict of opinion in medical evidence. This is in part due to the fact that medicine is not yet wholly an exact science, and as a result differences of opinion and of interpretation may ensue. However, there should be no difference

of opinion where observed facts are in question. The absence of definite authoritative medical pronouncements in the matter of trauma is regretted and is another reason for apparent conflict of opinion. We medical men have not as vet a definite and fixed doctrine or compendium that will always assist a medical witness in this type of case. Not until a commission of accepted experts give such a compendium for guidance, can we wholly escape some variation in opinions when the facts in the case are not clear cut.

In the consideration of these late cases following head injury we get a variety of histories as to the nature of the original injury In some there was a fracture at the base of the skull In others a fracture of some portion of the vault, either linear or depressed, or there may have been a severe concussion or contusion of the brain, with or without unconsciousness The patient may have observed but little at the time, but suffered headaches, fatigue, dizziness, etc., later Some may have shown various types of palsies or interference with the special senses. Among those who survive the acute period following head injuries, either as a result of good surgical care. or that plus a good constitution, we find after several weeks or months that a certain proportion of these cases have not made a complete recovery. Some still show evidence of organic defect, others various types of mental or convulsive states, and others in which there appears to be only a functional nervous disturbance We shall take up these various end results and endeavor to determine if there is a causal relationship between the trauma in question and the complaints of the patient.

TRAUMA IN ITS RELATION TO ORGANIC NERVOUS DISEASE

Epilepsy—One of the commonest fears expressed following head injury is that the individual may some day develop convulsions. Many physicians believe that most cases of epilepsy result from some previous injury. If this were true very few of us would have escaped that dread condition.

^{*}Read before a Joint Meeting of the New York State Society of Industrial Medicine and the Sections on Industrial Medicine and Public Health Hygiene and Sanitation of The Medical Society of the State of New York, Niagara Falls, N Y, May 10 11 12 1927

A MILK MODIFIER

Bottle-feeding as applied to the average baby is not a difficult matter, for with cow's milk and water together with a modifier made expressly for the purpose, a food can be easily prepared, which contains the essential elements of nutrition in properly balanced proportions and in a form suitable to the infant's digestion

Mellin's Food is an outstanding example of what a milk modifier should be, for it is made for the purpose, acts upon the milk casein in such a manner that protein digestion proceeds without interruption, furnishes the extra carbohydrates needed and in a form (maltose and dextrins) particularly well suited to the infant's digestion, adds mineral salts for the readjustment of morganic constituents and makes a mixture so appealing to the taste that babies take it eagerly See advertisement, page $v_1 - Adv$

LIVER FOR ANEMA

The value of liver for anemia having been established, the question of how to get as much as possible of the liver element into the diet has become a problem for the physician

As the effect of the liver fractions is that of a motivating force, its presentation even in small quantities frequently gives good results

The incorporation of the blood regenerating fractions of liver extract into a tonic is now attracting the interest of the medical profession

PHOS ĤEPATIC EXTRACT, a tonic stimulant containing beef liver extract in a palatable form, has been prepared for cases in which a general tonic and stimulant is indicated, furnishing as it does the stimulating influence of a high vitamin content, together with the red blood regenerative factors of the liver elements

DOSAGE

For adults 1 tablespoonful taken plain or in a little water 3 times a day For children one to two teaspoonfuls diluted with water See advertising

page xvi -Adv

COW'S MILK AND WATER

The doctor knows the importance of breast milk in relation to infant feeding. It is "the voice of nature" calling for a healthy, well nourished

The absence of breast milk consti tutes an emergency in the life of every infant. When such an emergency comes to the doctor's own infant, it is signifi cant how many physicians unhesitatingly turn to the best known substitute for breast milk—namely, cow's milk, water and Mead's Dextri-Maltose.

The bottle feeding for the doctor's own baby is not unusual

THE MEAD POLICY

Mead's Infant Diet Materials are advertised only to physicians (No feeding directions accompany trade packages Information in regard to feeding is supplied to the mother by written instructions from her doctor, who changes the feedings from time to time to meet the nutritional require ments of the growing infant Litera ture furnished only to physicians See advertisement, page vii -Adv

University of Buffalo School of Medicine

Requirements for admission Two years of college work, including twelve semester hours of chemistry, eight semester hours each of physics and biology, six semester hours of English, and a modern foreign language.

Laboratories fully equipped. Ample facilities for the personal study of cases

Address: SECRETARY, 24 HIGH STREET, BUFFALO, N Y

THE SAHLER SANITARIUM, KINGSTON, N Y

Pleasantly located in the charming city of Kingston, within ear access of New York and with all the facilities for treatment usually offered by a modern sanitarium Average price of rooms without bath, \$3500 a week, with bath \$500 a week, including ordinary medical and nursing attention Organic and functional disorders of the nervous system and invalidism from any cause. No cases of insanity or of communicable diseases accepted. Booklet upon request Raymond S Crispell, M D, Medical Director Tel, Kingston 948

maintain this position. However, there are those who maintain that trauma aggravates the luctic condition or causes it to "light up." In New York State there is rarely any difficulty in getting compensation under any of the above conditions if it can be shown at all that the disease has been influenced or aggravated in any respect as a result of a trauma.

Many have written and spoken on this question and there are many points both for and against the influence of trauma. Granted a case of central nervous system syphilis in a quiescent state, does a trauma cause the spirochete to become activated and produce a morbid lesion, accompanied by symptoms? This is difficult to answer accurately because we know and can recall many personal cases where paretic symptoms developed suddenly without trauma as a factor. On the contrary, there are some fairly convincing cases in the literature wherein a trauma seems to have caused the sudden "lighting up" or aggravation of the symptoms

I believe, however, that when a relationship apparently exists it should be limited as to time and that any symptoms of aggravation beginning later than a few days following the injury, should not be attributed to the injury

The same statements as have been made for paresis apply likewise to tabes and cerebral syphilis

Multiple Sclerosis — This entity has come into my experience a number of times in compensation cases and I wish to deal with it but briefly The absolute cause of this disease is not known However, all evidence apparently is to the effect that it is an infection, hence there is little likelihood that there is any causal relationship between it and trauma. Again the war experience helps us out. Out of a very large series of injuries in the British army, only six cases of multiple sclerosis were found. Nearly every one of these had a definite injury to the nervous system and it was not certain that symptoms had not existed before the injury That there is a possibility of a trauma "lighting up" a latent process cannot be absolutely denied. In most cases if an accurate history can be obtained it will be found that some of the symptoms preexisted the injury

Delayed Traumatic Apoplexy—Oppenheim and the German school were first to emphasize this rather rare condition. It has even been used to explain attacks of apoplexy coming on many weeks after some type of head injury. After careful study of this condition by many workers, it is agreed that true delayed traumatic apoplexy shows some symptoms shortly after the injury, which increase to the appearance of the actual stroke, and that the apoplectic attack must appear in a very few days, no longer than ten days after

the injury Therefore, in all such alleged cases one should be careful again to obtain an accurate history of the symptoms, and in their absence discard the diagnosis of delayed apoplery

Parkinsonian Syndrome —Since the advent of encephalitis some years ago, this syndrome is not infrequently a problem to wrestle with as resulting from trauma. It has occurred several times in my experience and in each case after very careful search from a variety of sources it was established that the individuals had had encephalitis before the injury and that some of the symptoms were present before the injury occurred.

Hail (3) reports two cases, one of which had the element of compensation in it, while the other had not. In each instance a wound had occurred which was followed by infection and shortly afterwards early symptoms of the Parkinsonian syndrome set in which increased There was doubt of a prior infection in one case and in the other it seemed fairly clear, so that Hall believes it is possible in some cases to get a Parkinsonian syndrome from a trauma

When one considers the diffuse pathology of this condition, it is rather difficult to agree with him that it may cause the condition

Other Traumatic Nervous Diseases—In such conditions as syringomyelia, progressive muscular atrophy, ascending neuritis, etc., they rarely occur where the question of trauma enters, but it may be said that it would be difficult to establish how an injury could produce them. We look upon these conditions today as probable examples of progressive neural degeneration or an abiotrophy, and as the great proportion of these occur independently of any injury, it would seem that some chemical or biochemical factors, rather than a traumatic one, should be sought in explanation

Traumatic Meningitis—This condition may follow a fracture of the skull and when so it may occur several days, or even weeks, and occasionally months after the injury—It is not common

Occupational Diseases —While these conditions do not definitely belong to the traumatic group, still, cases of lead, arsenic and monoxide gas poisoning are common and should be mentioned. There is usually no dispute as to cause and effect.

Arterio Sclerosis — Following a blow on the head many of these individuals rapidly show symptoms of deterioration and become demented. The blow in these cases is not the cause but can only be interpreted as aggravating a pre-existent condition. This type of case is always open to honest debate.

Electric Currents —Usually, if they are severe they result in death. The result in electric currents depends on the voltage and resistance in ohms, the amount of contact, duration of contact

Until the great war, criteria on this subject Now there are available was not convincing reliable statistics of several countries in reference to convulsive states and head injuries furner carefully went over eighteen thousand cases of gun shot and other types of wounds of the head occurring in the great war, and found that after a period of between five to eight years had elapsed some eight hundred, or approximately five percent, had developed convulsive seizures Figures compiled after the Franco-Prussian war, which occurred nearly sixty years ago, gave approximately the same percentage Other observers from other countries have reported between five and six per cent of epileptic cases following head injuries sustained in the war. It will thus be seen that about five out of every one hundred cases of severe head injury ever develop a convulsive The injuries were of all kinds, including fracture, lacerations of brain tissue, palsies, etc, both in those developing convulsive seizures and those that did not

The question immediately arises, why have not the other ninety-five percent developed convulsions? S A K. Wilson, (1) Turner and others state that there is something more than local tissue alteration requisite for the production of traumatic epilepsy, and they feel that the determining factor is an hereditary constitutional predisposition to nervous instability and epilepsy In support of this claim Gordon (2) obtained a history of neuropathic predispositions in seventy-five percent of his cases of traumatic epilepsy which had resulted from war injuries to the head. It would appear that an hereditary tendency in preexistent neuropathic constitutions is necessary before a brain injury will bring about the convulsive state There seems to be abundant evidence that the predisposition is more important than the injury itself, and it is doubtful if epilepsy ever occurs following head injury except where this predisposition exists

Brain Timor—Before one considers a causal connection in this condition it must be definitely established that there were no symptoms of this condition before the injury, that there has been no other factor such as lues, tuberculosis, etc, that the head must have been actually injured, and that the symptoms of brain tumor must have begun shortly after the head injury and continued to increase in severity, and later be confirmed by operation or necropsy. If one will analyze alleged tumor cases with these conditions in mind, he will have difficulty in proving that tumor results from injury, with the possible exception of osteoma or sarcoma of the bone at the site of the injury

Following the great war we have no conclusive cases as yet established in the literature of any country There are a few in the literature which would seem to show a connection, but they do not fully comply with all the above conditions How easily one might be misled is shown by the following personal experience

H SA salesman, aged 36 Whilst driving his car, met with a collision wherein he bruised the left fronto-temporal region of his head He was not confused after the injury The next day he drove his car to his home, some fifty miles away, and later complained of slight headache, which he located in the vicinity of the bruise He was not busy, so remained at home during the next three and one-half weeks, during which he complained somewhat of headache, was somewhat listless and dull, but in general was cheerful On the twenty-seventh day following the injury he suddenly became confused and within a few hours went into semi-stupor and to bed This condition continued, without temperature, for about a week

I saw him in consultation at the end of this time and the stupor was fairly deep but he could be aroused for a few moments only and then would sink back again. At this time his pulse was 64 per minute. The eyegrounds were normal All cramal nerves were normal There were no palsies He was removed to the hospital and an X-ray was taken of the head, which showed no fracture, but the plates demonstrated a darkened shadow in the left frontoparietal area near the site of the location of the original bruise This shadow, plus his slow pulse and his stuporous state, plus the increase of spinal fluid pressure, made us decide to do a decompression, left side Upon opening the dura the brain did not pulsate but shortly after it suddenly bulged and the cortex split and a darkened mass made its appearance, which looked like an old hem-This was removed as best we could and sent to the laboratory for examination It was reported as tumor material, but the type could not be made out The patient did not improve following the operation but died within four days

An autopsy was secured of the head only, which revealed over a dozen similar tumor masses scattered through the cortex of the brain, and one or more of them was found in every lobe, both sides A careful microscopic analysis showed them to be melonoma. These tumors varied in size from 1 to 3 cm in diameter. Instead of the injury being the cause of the tumor in this case, one could well argue that the number of tumors was contributary in the production of the collision.

General Paresis, Tabes and Cerebral Syphilis—When one reads the older text books he observes it frequently stated that trauma causes paresis and tabes—Since the discovery of the spirochete I do not see how one can longer

as one of "Head Wound Syndrome" The symptoms of the condition are headache and dizziness, then irritability, apathy, emotional instability, fatigueability, poor memory and noises in the ears Later these cases may develop tremors or a vasomotor flushing and palpitation, grotesque types of gait, numbness of various parts, paresthesias, stammering, etc Some may develop palsies of limbs or hemian-A few develop loss of function of one or more of the special senses Others show gross psychotic symptoms There appears in most of these cases to be an inverse relationship between the severity of the symptoms and Severe brain injury cases rarely the injury develop any functional nervous symptoms Their minds are content with what they have

Physically we find no definite organic signs The tendon in the central nervous system jerks may be very active, there may be flushing of the face and hands, there may be slight tremor of the fingers and some acceleration of the pulse, some have horrible dreams and There are those who believe we nightmares should not recognize such a condition or entity as traumatic neurosis, but regard the whole set of symptoms as hysteria However, when we take careful histories in these cases we find that in all or nearly all there has been existing a neurotic make-up, and thus there is some relation between the trauma and symptoms, but if we observe our court calendars and follow the cases both before and after their consummation, particularly those in which there has been financial gain from the injury, we will soon be convinced that finance colors the whole picture in spite of any previous existent nervous tendencies

Wilson¹ reviews the histories of three large railroad accidents in England wherein approximately fifty percent of the passengers sued for "shock" and neurasthenia without any physical injury. This would tend to prove the influence of the hope of compensation in these cases.

In the industries the question is a bit different from the injuries wherein litigation is started, for many of these individuals make use, either consciously or unconsciously, of the accident to get away from the difficulty of work and responsibility and other troubles and settle back like the idle rich and live on the income compensation affords He may find fault with the small amount of compensation paid, but the unconscious gain and satisfaction he attains by being free from drudgery will more than outweigh his loss when estimated in dollars and cents In other words, most men do not like their work and the injury offers an avenue of escape from toil in which they rarely have an objective beyond personal freedom

In nearly all cases of injury, intense fear accompanies it, but soon this emotion ceases to be associated directly with the accident, but

becomes attached to other psychic processes which may be in some relation to the original excitant of the fear and in which the patient may not wholly recognize in its relation Nevertheless this emotional influence, plus other fears and suggestions, plus litigation and the wish for actual gain from the injury, the not infrequent bad advice from physicians and lawyers, seem to be the chief factors in the early development of the so-called functional traumatic neuroses, and also serve with factors already mentioned to keep them up

Bonhoeffer⁶ states that fright is always associated with these lesser head injuries and with it there is a certain degree of vasomotor disturbance, which is short in duration unless there is the wish to draw advantage from its presence. He says it is a mistake to call traumatic hysteria a disease, it is only a psychologic reaction which occurs with wishes for gain from a circumstance, and disappears when the wish is gained or is given up. As illustration he claims that in the German prison camps during the war there were no cases of shell-shock or neurosis, because these men knew they were away from danger, hence there was no fear and no reason for further wish

In general it may be said that the lighter these head injuries are, the greater the likelihood of developing symptoms of nervousness, -and some of the worst cases result from fear alone, without any real head injury having occurred Another interesting point bearing on the peculiar type of psychologic reactions most of these cases present, is that we rarely meet with any of these complaints from men or women who hold a good position in life, who have a real duty to perform, and who desire to do their bit well. They pull themselves together after the injury, go over the situation, are thankful they escaped death, and go back to work, casting the fear aside as rapidly as circumstances permit. They have no time for litigation

AIDS IN DIAGNOSIS

In attempting to solve these knotty problems as to just what type of case one is dealing with, it is imperative that one should be in possession of all the facts pertaining to the original injury, its extent, and the presence of any organic signs in the nervous system, howeverfew or small they may have been, again, the results of X-ray examination and any laboratory or other findings of value These points are of particular importance because most people entering into any form of litigation of compensation are suggestible, and frequently the trauma offers an escape from difficulties many are prone to exaggerate and falsify their memories, especially if such information might be of advantage to their claim. Many of these cases have also been badly advised early, both

and its extent, and how much interference there was in the contact, whether the skin was dry or Direct currents are usually less dangerous than alternating ones Electrical currents may produce a variety of changes in the brain At times hemorrhages follow in various portions of the brain and changes occur in the ganglion cells When death occurs it is thought to be due to the sudden cessation of respiration or the heart beat, and in the absence of death we may get later signs of irritation, such as transient palsies, temperature or There is unusually an amnesia confusion present, particularly if the patient was unconscious for some time Occasionally optic atrophy follows The late symptoms of this condition are a definite deterioration, memory defects. irritability, fatigueability, depression, and they may show trophic and vasomotor disturbances Telephone operators and telegraphers frequently complain that they receive sudden shocks whilst in the line of duty, resulting in all sorts of complaints regarding the head or the special senses These are, in nearly all instances, hysterical in nature

Mental Diseases—It is a common statement that a marked relationship exists between trauma and mental disease However, since the war, wherein there were so many head injury cases and where all participating countries have kept such excellent record of the injured, the results would seem to indicate that there must be a change in our former belief Hadley (4) reviews the literature and then follows with a description of numerous cases occurring in his experience at the St. Elizabeth and Walter Reed Hospitals, and makes this definite statement "That trauma as a cause of any definite mental disease entity must be received with reservation" In all cases there is a strong prior psychotic or neurotic taint existent all cases where trauma is supposed to be the precipitating factor, he suggests the following terms be used

- 1 Post Traumatic Constitution
- 2 Post Traumatic Defect Condition
- 3 Post Traumatic Concussion Syndrome

He states there is no clinical entity which may be properly called a traumatic psychosis, but an alteration in personality occurs which may be described as a post traumatic constitution S A K. Wilson likewise believes, after a long war experience, that a single brain injury cannot precipitate a definite type or definite entity of mental disease. In other words, these men do not believe and cannot find evidence that these definite conditions like dementia praecox, manic depressive insanity, etc, ever occur as such following trauma

Concussion syndrome cases may show febrile reactions with delusions and may or may not have had a period of unconsciousness or clouding of the field of perception They usual-

ly are restless

The post traumatic constitution cases present irritability, headache, fatigue and display depression

The traumatic defect states all present some defect of the brain, dependent upon lacerations or some other lesion, and they present various symptoms of aphasia or secondary mental degeneration

In considering broadly a causal relationship between any of the organic nervous diseases and trauma, the time element is especially important. Definite organic signs of injury to the nervous system set in immediately or within a few hours, and it must never go beyond a week or ten days, except in the case of convulsions and mental symptoms which may appear much later

In the matter of so-called exaggeration of symptoms of an already existing disease it must not be forgotten that the disease may have been the cause of the accident instead of vice versa. At any rate, the time element is especially important, and my feeling is that if there is no exaggeration of pre-existing symptoms or no symptoms begun until after the third day from the injury, then it is unsafe to argue for a causal relationship between the trauma and the symptoms

Trauma of the Head in Its Relation to Functional Nervous Diseases

When we enter this phase of the discussion we tread immediately on difficult ground filled with conflicting problems These conditions are usually classed as traumatic neurasthenia, traumatic neuroses, traumatic hysterias, etc The usual history in this large group is that there has been some type of head injury, usually not severe, and it may or may not have been accompanied by a short period of unconscious-The average case does very well for a few days unless there was great fear associated with the accident, when a train of symptoms Usually the sympmay begin immediately toms appear after a few days or weeks, rarely The individual may appear to be making a complete recovery, and then for no apparent reason begin his long train of subjective complaints Nearly all this group develop these symptoms following industrial, automobile and railroad accidents, the so-called shell-shock of war, and explosions in civil life In nearly all this type of case there occurs some form of litigation or compensation, which makes one feel, though hesitatingly, that many of them desire to make financial gain out of their personal A few develop symptoms without troubles this factor, but that group is very small in comparison It is rather striking that most of these cases have nearly the same set of complaints, regardless of age, of nationality or degree of injury, although most of them occur with greater frequency in certain races

The similarity of the symptoms and complaints led Dana to designate andition about a large proportion of late symptoms in The settlement this group could be avoided should not only be early but should be as complete as possible In Denmark after a certain space of time elapses after injury, a board of physicians appointed by the State determines the extent of the injury, following which compensation is awarded and the case is closed The result is that over 90% of injured workmen return to work within two months How different here!

When you make a lump sum settlement in compensation cases the individual may invest his money or use it as he pleases Sooner or later his money gives out or he loses it. Then his symptoms slowly return, and again he frequently makes claim for more compensation Hence settlement does not end all compensa-If early settlement is impossible, all efforts at relieving the symptoms should be attempted, but we shall find that in very few do we get any relief so long as there is any type of compensation or litigation existent There is something about the psychology of that situation that blocks all efforts How different when cases are finally settled, especially in Supreme Court when the affair is definitely I have seen paralysis, anesthesia, blindness, deafness, etc, disappear in a very few weeks after a handsome financial result

However, not all recover in any system, so that we may say that traumatic neurosis has in general a somewhat guarded prognosis the evident hysterical types the prognosis is very good providing satisfactory settlement is

Formerly this treatment was called "Gold treatment made with bank notes"

In addition to attempted settlements, we, in

the meantime must employ rational treatment, such as suggestion, electricity, massages, heat, The patient must be encouraged to work Eventually it will be found that some of these will not be able to carry on the duties of their old positions, particularly when the duties thereof require their going above the ground When above the level they frequently complain of dizziness, and in such cases it is well not to urge them to go high When on the ground they do their work as well as ever Again, some have not the same endurance and energy as they had previously However, they have no other complaints and if not urged or forced too strenuously, they are well and get on satisfactorily in their work It will thus be seen that if care and attention are given to each case individually, that nearly every one can be returned, not only to work but to relatively complete health

DISCUSSION MAX M PEET, MD, ANN ARBOR, MICH

l agree so thoroughly with Doctor Eckel that it is mainly a question of substantiating all of his remarks As a neural surgeon I see almost daily epileptic patients who are perfectly sure their epilepsy is due to some previous trauma. It seems to be an opinion which is very wide-spread among the medical profession, as well as among the laity It is the exceptional case, where generalized or so-called idiopathic epilepsy has a traumatic basis

On the other hand, Jacksonian epilepsy is rather frequently due to trauma or to brain tumor, and in these we do recommend operation

My usual reply to the various doctors who refer generalized epileptic patients who have had a questionable fall, is that we find no indication whatever that the patient's symptoms are due to trauma, that I think in many cases the reason the patient fell from the automobile, or from the wagon, or from the street car, was caused by his having an epileptic attack which had not previously been recognized

I do not quite agree on the production of brain tumor, endothelioma or meningeoma does definitely start from trauma in some cases Cushing summed it up something like this he had operated altogether too many cases, finding the tumor immediately beneath the area of known trauma to have it a coincidence I have had the same experience and I am interested to see how many of our boys that were injured in the world war eventually develop brain tumors The cases that we have had following trauma in a known location, i e, were exactly under the skull fracture, have all been greatly delayed, some have gone 12 or 15 years before the tumor made itself manifest.

by physicians and lawyers, so the situation is not always easy to clarify

It should be borne in mind that in this paper we are dealing only with such cases as give histories of some previous head injury, whether of a few weeks or years standing, and in which there still persist the nervous system involvement The injury may have been very severe or very mild In a certain proportion of the cases there will be evidence of definite brain or nerve injury manifested by some focal sign, demonstrable in the cranial nerves or meninges, the long tracts, or by a diffuse cerebral process In this group, where there is definite evidence of organic nervous system involvement, we may even have present the same group of complaints, usually associated with the so-called functional type

In some this syndrome may be pronounced and in others very mild, so the picture is often somewhat clouded which makes proper evaluation somewhat difficult. However, the essential point in cases with definite organic signs is to determine if it is one that can be relieved or helped by surgical or other means. This must be determined by careful neurological, and X-ray examination with other analyses as adjuvants

In the larger group comprising head injuries which were not fatal and which did not cause definite crushing or hemorrhage of the brain, and which in nearly every case presents part or all of the usual head wound syndrome of Dana then our problem is the greater, because there is as yet no sure or absolutely satisfactory explanation of the symptoms, and there is yet no absolutely sure information as to the prognosis Therein lies our difficulty

As already stated, the vast majority of these cases are under some form of compensation or litigation, and the psychology underlying that field goes far to give an explanation. Still it does not answer in all cases and one must be ever watchful for unobserved evidence of an organic lesion persisting. Considerable work and speculation exist in the literature in explanation of these cases. As yet no known hypothesis explains all

Sharpe' feels they should be examined from the standpoint of neurological findings, eyeground changes and spinal fluid pressure readings. When there are slight eyeground changes and some increase in spinal fluid pressure, he advises a subtemporal decompression, and when this is done he claims to have found changes in the meninges sufficient to explain the symptoms. He states there is thickening of the pia-arachnoid from the old, "wet brain" or a former meningeal hemorrhage, and in this way the spinal fluid is not being absorbed properly, hence the increased pressure producing headaches, dizziness, poor concentration, etc. The decompression affords drainage and

relief from the pressure, and then improvement in the patient follows

More recently O Cchwabs employs encephalography of the head after lumbar puncture and air injections, and finds in cases where physical brain injuries exist, the following

1st—Failure of the air to enter the lateral

ventricles,

2nd—Dilatation of both ventricles or displacement and dilatation of the ventricle on the injured side,

3rd—Abnormally large collection of air on the convexity of the brain, with ventricles filled

or unfilled

He also uses injections of phenolsulphonphthalien by the method of Dandy—Blackfan into the ventricles and observes how soon the dye appears in the spinal fluid, or the dye may be injected into the spinal fluid and the fluid later secured from the ventricles. In some cases the air passes and the dye does not. This he calls "particle ventricle closure"

His conclusions are that even slight head injuries, if produced by a blunt object, occasionally show signs of ventricular blocking, even in the absence of any organic neurological signs, and in the presence of the usual head wound syndrome. While it would be unwise or even impossible, if not dangerous, to apply one or both of these methods to most cases, still in persistent cases which are not clear as to diagnosis, one or both should be used

Thus we observe that the problem or differential diagnosis is truly a knotty one and as yet we cannot be certain in every case. Care ful examination neurologically, plus entering into any possible motives in non evident organic cases, will keep us in the right path in nearly every case.

PROGNOSIS AND TREATMENT

This can be dealt with from the standpoint of a case with organic injury, and then with lack of such signs. We cannot hope to modify to any great extent cases presenting organic signs, unless produced by some condition which we can relieve by surgical, or in some instances, by medicinal procedures. However, it must be borne in mind that in many of these serious head injuries, especially with boney defect, wherein there are nervous symptoms of a general nature, such as headache, dizziness, etc, that bone graft, smoothing the rough bone areas, or making any cosmetic improvement often tends to give marked relief from these distressing symptoms

When it comes to the group without organic signs, several means may be considered. The first consideration should be an early and careful examination of the case by a good physician, or if deemed best, a consultant as well, and the true nature of the condition explained to the patient and an effort made for a very early settlement. If this could be brought

thorough cardio-vascular estimation, can only then be given valuable interpretation

Precordial Pain—Varying, from indefinite twinges that occur at either frequent intervals, or, that may assume the agonizing cramp of angina has been so constant a finding that it must be mentioned first

As to its causation, so far as is known, there are no nerves of sensation in the heart muscle

Sherrington, McKenzie, Head and others, have demonstrated that a viscus though not possessed of nerves of sensibility may, when irritated, excite corresponding visceral segments of the spinal cord—and, that from such areas, centrifugal impulses are sent to the surface areas—which in the skin, give rise to abnormal reflexes or sensations usually felt, either as pain, or are elicitable as tenderness, tingling—coldness—or other trophic translation

Such areas, in the vast majority of patients with coronaritis, are in their order of frequency—

- 1 Chest
- 2 Precordium
- 3 Epigastrium
- 4 Shoulders
- 5 Arms
- 6 Interscapulum*

At times, for example, epigastric pain or gastric distress, is so severe as to bring the patient to his physician for some alleged dyspepsia or indigestion. And it is almost anomatic that over indulgence in food not only aggravates this gastric distress, but the precordial pain as well

Occasionally, pain or tenderness is not complained of—and the only suspicious point in the history is a narrative of some attacks of

dyspnoea—or of palpitation

Perhaps, merely a sense of substernal oppression constitutes the major complaint. Yet it is increasingly more constant with an evertion, whose limits are being more and more minimized.

A sense of malaise or of asthema is often complained of—and periods of rest-days are happily productive of a temporary cessation of such a distress. However, sooner or later, it returns again, encroaching more and more on the comfort and activity of the patient

Occasionally, the patient gives a fairly good account of what on examination proves to be extra-systoles or some other arrhythmic disturb-

ance

Auricular fibrillation may be found, and, I have seen patients change these rhythms in a capricious manner from extra systoles to auricular fibrillation—then to a normal rhythm

for some weeks or months, returning to the one or other arrhythmia from time to time

These rhythmic vagaries indicate some change in the myocardial structure, and must be interpreted as evidence of some incipient

myocardial damage

Necropsy findings bear out the possibility of the occurrence, without great disturbance to the patient, of definite sclerotic closures of the minor coronaries from time to time—and of myocardial scarring—with pericardial adhesion, etc. In these cases, where death subsequently occurred from coronary thrombosis or embolism, the picture seems so logical as it is followed step by step from one site of closure—in a minor vessel first—then finally to a vessel or vessels of the first order

Insomma—mability to sleep on the left side—casy cahaustibility—perhaps too, some of the ear marks of the cardio nephritic—or apoplectic type—or, on the other hand, the flabby, indolent obese, middle aged adult, all these, are to be taken as danger signals in the treatment and guidance of the patient

To be sure, our old time dread caution in, and strict supervision of, valvular heart disease patients, condemning them to the most rigid inactivity, has, to great extent been found groundless. But it is my hope and purpose to recall and emphasize such anxieties and precautions in the cases of coronary cardiopaths.

I believe that in many cases, with proper care — strict regime — judicious medication — these patients can be kept in moderate comfort and a fair degree of activity and furthermore, that the advancing process of coronary damage can be decidedly delayed!

Heart rest—which means recumbent body posture at some time during the active day, is the leading feature of benefit in the regime to be instituted

Next in importance, is a complete dietetic revision and, not so much as regards a strict apportionment of proteins, carbohydrates or fats, but rather a diminution of the amount of food taken at one meal

Exertion in any manner whatsoever is to be absolutely avoided! To tranquilize the energy of the heart—to minimize the foot poundage work of its daily labor—means a greater possibility of its vessels rehabilitating themselves Rest and healing are companions that work best together

Therefore, I condemn most vehemently, the practive of men of middle-age to indulge in the more strenuous games or athletics. Our problem with them is not to over-exert their vascular tree, but merely to gently stimulate it

Animal experimentation has been attempted by ligation or obliteration, either partial or complete, of one or both right or left coronary ressels since the last century, but the data of

^{*(}I have one patient whose reflex pain locus is in the chin at the symphsis)

CORONARY DISEASE

By A E RENNER, MD, NEW YORK, N Y

ORONARY Disease is a problem upon which cardiologists of today are focusing their major interests, yet, unfortunately, much that is studied, and still more what is presumed, cannot at the present, be accepted as final

The entire subject is so obscured by our limited methods of studying normal function, as well as cardiac pathology, that much remains conjectural and doubtful

Direct Diagnosis of all the phases of Coronary disease is not as yet absolutely possible despite the many occasions when coincident opinion is borne out at autopsy

The symptomatology of coronary pathology be it gross or minor, can be as diverse and disproportionate as any protean disease.

The circulation within the heart performs a most complex and diverse function Mechanically of course the major duty is

(a) Blood supply

(b) Blood drainage (interchange)

Perhaps because of its spheroid, or rather, ovoid shape the myocardial bulk in respect to its circulation is comparable to the "Circle of Willis"

The Coronary vessels, branches and trunks as well—must in a reciprocal and absolutely unobstructive lumen change, fill and empty themselves in a harmoniously timed, exact interval

While the myocardium is relaxed, coronary dilatation and filling must occur At the next instant, when systole occupies the cardiac cycle—these vessels must be ready to offer no delay or obstruction to the forceful contraction of the myocardial fibres

Furthermore, the mechanism also consists of a local bio-chemical change. There must occur unhindered, glycogenic restoration—katabolites or metabolites must be withdrawn from the myocardial protoplasm and, the pulmonary veins must suffuse the entire heart with their oxygenated blood. However, astounding and miraculous, as the power and endurance of the heart musculature may be it is always and ever at work, controlling its own circulation as well as that of the body

At one moment, it is stimulated to the utmost—at another it is relaxed to the degree of a mere tonicity (Refractory period)

It is my opinion, that chiefly in the heart, and secondarily, in the brain circulation, lie the inherent mechanical factors for the greatest amount of arterial strain. And that, in consequence of this strain, interpreted in terms of gradually, even though slowly, progressive arterial wear and tear—that sooner or later,

one or the other of these two arterial cycles, must succumb to an accident

Such causes of death for example as pneumonia — tuberculosis — toxemia — septicemia — bacterial infections, malignancy, etc.— I would classify as accidents that are introduced or imposed upon the human organism from without And I believe, were man to escape such exogenous invasions (infections) and be spared to his allotted three score and ten years —his usual cause of death would be dependent on some vessel pathology either in the heart or brain

In other words—if I may take the liberty of paraphrasing Dr James' definition of Life from "Life is the predicament preceding Death"—to—"Life is the process that produces arterio sclerosis," such would be my dictum

The coronary arteries sclerose, to the point of serious damage at times in surprisingly young adults—and at times, patients in their seventh decade and beyond, show not even the slightest sign of any serious coronaritis

On the other hand—a definite coronary thrombosis may occur. If in a large vessel, it is a fatal issue that ends life quickly or within a short time with concomitant symptoms of pulmonary oedema—uremia—cardiac rupture, etc., as the result of the myomalaceous change in the dependent (circulatorily) myocaridum (?) (Ziegler)

Gross and others cite interesting cases of major coronary vessel occlusion occurring without any symptomatology, and the individual remaining alive and active for years after such an episode (Gross Louis Blood Supply of the Heart—p 138, fig 31)

Coronary disease—slowly progressive and with few signs—such as is found in middle aged cardio-sclerotics—perhaps best typifies the group, with which it is the purpose of this paper to deal

And I have chosen this particular phase of coronary disease masmuch as I find that it constitutes the most tragic and yet the least suspected of all cardiopathies

Case histories are too numerous and evidence too common, so that I do not think it necessary to call attention to the frequent deaths that so suddenly and shockingly occur daily, in just such types as it is my plan to

Unfortunately, the symptoms in this group of cardiacs, are difficult to obtain and, only the closest scrutiny to historical data may elicit some complaint. These, when aligned, with a most careful physical examination, that must include orthodiagraphy—electro cardiography, as well as all the other routine of a

ingly important in establishing a diagnosis of ulcer even though symptoms are extremely suggestive, to bear in mind the reflex motor and sensory disturbances that the stomach will register. The reader has called attention to the frequency with which duodenal ulcer symptoms may appear in patients not having ulcer. The time of onset of symptoms, the character, radiation, frequency, genito-urinary disturbances, heart-burn, periodicity, etc., are of such importance that one does not hesitate in stating that the history is a most important factor in helping to arrive at a proper conclusion

The physical examination usually presents few findings that are of any assistance in the diagnosis. Its greatest importance lies in its negative aspect. Thorough physical examination is made to exclude such conditions as herma, tumor, lues, etc., which may be the actual or contributing factor responsible for the symptoms. The presence of an ulcer with atypical symptoms does not always mean an atypical patient. Not infrequently the presence of an ulcer in the stomach or in the duodenum may be associated with an inflammation of the appendix or gall bladder which may complicate the picture and produce atypical symptoms.

In the interpretation of the history and physical examination one should always bear in mind the constitution of the individual and the conditional factors which may play a prominent rôle in the symptomatology Infection, mechanical factors, the neurogenic system, and the vascular system, all play an important part, if not in the pathogenesis of ulcer, surely in the continuance of symptoms It becomes increasingly evident that the examiner in interpreting the findings after a history and physical examination should bear in mind that since the pathogenesis is so little understood the character and severity of the symptoms will vary greatly What one patient may describe as a severe pain another individual may call discomfort, and the evaluation of the results of treatment will depend in a great many cases upon the individual sensitiveness and reaction to daily life.

The X-ray is the most important aid in helping to establish the diagnosis of ulcer. A new flexible gastroscope which is being prepared by Dr. Collens and the reader, may prove to be of practical value in the examination of the stomach for the purposes of diagnosis as well as treatment. Not infrequently after all means of diagnosis have been exhausted and the clinical impression of ulcer still persists but cannot be confirmed by the Roentgen examination, the gastroscope may, beyond a shadow of doubt, establish a correct diagnosis

Gastric Ulcer—The X-ray diagnosis of gastric ulcer is divided into the direct and indirect signs. The niche is the one single direct sign of greatest importance in establishing the diagnosis. Held

and Gray speak of two forms of niche, one equivalent to pulsion diverticulum on the basis of simple ulcer which may justify medical treatment and another pulsion and traction diverticulum which necessitates surgical intervention Diverticulum of the stomach may occasionally stimulate a niche Of the indirect signs may be mentioned spastic indentation of the greater curvature, large air bag, increased peristalsis in the pars media, and serrations along the greater curvature. Schnitzler describes an erosion at the pyloric sphincter which may at times lead to hypertrophy and produce a mass simulating a tumor Microscopic examination alone may be the only means of arriving at a correct diagnosis. A large callous ulcer of the pylorus can at times be differentiated from a carcinoma because of the associated spasm and symptomatic relief after medical treatment in ulcer patients It is important to point out although the niche is seen along the lesser curvaure the ulcer really is present on the posterior wall a few millimeters beyond the lesser curvature If there is no involvement of the muscularus mucosa a niche may not be seen and the diagnosis of ulcer be missed

Duodenal Ulcer—Ulcer of the duodenum occurs most frequently in the first portion—Because of its anatomical position an ulcer here is more readily accessible to X-ray diagnosis than is that of the stomach—Fluoroscopic examination, the reader feels, is of greater importance in establishing the diagnosis of ulcer whether it be of the stomach or duodenum than is film study—During the fluoroscopic examination the barium meal as it enters and fills the stomach may reveal a lesion on the posterior wall or greater curvature which may be obscured when the stomach is filled and films are taken

The diagnosis of ulcer of the duodenum has been greatly advanced by L J Cole to whom belongs a great deal of credit for having drawn attention to serial radiography as the most important method in the diagnosis. As in uscer of the stomach, here too the X-ray manifestations may be divided into A—direct and B—indirect signs Under the direct signs are described the niche, Cole defect, diverticulum, or bulbous pouch formation Haudek, and more recently Akerlund, have shown the importance of the niche in the diagnosis of duodenal ulcer Deformities of the duodenum, giving the bulb the appearance of a branch of coral, the form of a clover leaf, etc, are all spoken of as Cole defects Among the indirect signs, Held and Gray classify them in order of importance as follows 1-Hyper Peristalsis-usually sets in early, is very active, and the contraction so deep that the stomach appears divided into several compartments The duration of each peristaltic contraction is much longer than the northese workers, notably Bezold—Erichsen—Rochefontaine—Rousseau, and others, leave much to be desired when comparisons with the human countertype are made

Samuelsen and Grunager report most interesting findings resulting from left coronary ligation in dogs. Yet, this excellent work cannot serve as a sufficient criterion in our studies on man.

Recently Pardee, using the electrocardiograph as a worthy adjunct to the precision of further study along these experimental lines in the human heart, and Oppenheimer and Schwartz as well—report a rather significant finding in some patients suffering with coronary damage. They have successively found a widening of the T wave just after the R complex, which seems to indicate a coincident myocardial disturbance in the form of an ischemia, with its resultant change in electric potential

Nevertheless, necropsy findings repeatedly show diffuse polyarterial sclerosis in the cardiac vasculature — reaching limits of even intimal destruction in medium sized coronary vessels, yet, no signs of myocardial damage have been found. Indeed it has retained its normal stability, and clearness (?) under the

strictest microscopic scrutiny

So again, our studies avail us nothing to the present day, beyond the fact that by exclusion there remains one constant, viz Coronary disease per se, just as cerebral sclerosis, is possible in its various stages, and, minor vessel damage (to the point even of thrombosis) may be unproductive of either symptoms or findings or any evidence, and, that without any warning, sudden death may ensue!

In consequence, it has been my custom to rigidly enforce all the necessary and stringent cardiopathic supervision, revision, and regime

of the daily life of this type of patient

Rest—diet—gradual reconditioning of the body weight to normal standards, then, as an improvement can be noted by the abatement of some of the symptoms, some form of graded evercise is advised. If possible, a tour of the German or Austrian baths or those of Southern France is recommended.

For medication—the type of patient is the guiding factor Pain must first be subdued and if possible, entirely vanquished Where no pain is complained of, it seems to me inadvisable to prescribe sedatives or antispasmotics

Whereas anginoid seizures are best controlled by Morphia alone—(which in these patients acts as a cardiac tonic)—for milder attacks of pain—luminal, phanoderm, sedobrol broth, etc, or any of the barbituricester group seem to be most effectual Occasionally, I have very successfully used mustard plaster stupes covering the entire chest and extending down the left arm in these attacks accompanied by extreme pain

Diathermy, autocondensation, hydrotherapy and balneotherapy, as also, massage, Swedish resistance movements, etc., mercury vaporlight, etc., are all adjuncts conducive to relaxation and rest, and merely that alone!

Potassium Iodide in any form deserves the same choice here as for arterio-sclerosis else-

where

Frequently, hypertension complicates the various manifestations of coronary disease

Often have I observed coronary spasm of great severity, accompanied by pulmonary odoema attack such individuals

Nitroglycerin morphin, dionin, cupping, phlebotomy, and sometimes ether inhalation, serve as rapid aids in these desperate straits

Repeatedly the question of tobacco as an inciting factor in the aggravation of coronaritis has been raised. In my opinion moderate smoking has no influence in the causation of these attacks nor in their frequency.

Coffee is a coronary dilator, and relaxes as well as stimulates the myocardial circulation

Digitalis, in long and continued small dosage gauged on a minum Hatcher cat unit scale to my mind, acts as a decided cardiac tonic agent

The question of surgical intervention, such as Section of the nervous sympatheticus or block anaesthesia, for those cases which suffer severe agony—(anginoid seizure), I have decided against, because of the high percentage of fatality that so soon occurs after operation

THE DIAGNOSIS AND TREATMENT OF GASTRO-DUODENAL ULCER* By IRVING GRAY, MD, FACP., BROOKLYN, N Y

THE methods of examination for the purpose of establishing the diagnosis of ulcer of the stomach and duodenum have become universally standardized. The considerations in the diagnosis are history and physical examination, X-ray examination, and laboratory studies.

*Read at the November, 1927, meeting of the Rockaway Medical Society, Far Rockaway, N Y The history is one of the most important aids in the evaluation of the diagnosis. Moynihan has described a cycle of symptoms associated with gastric ulcer—pain, comfort, food, pain, and a cycle associated with duodenal ulcer—pain, food, comfort, pain. The stomach is a very sympathetic organ and reflexly is affected by an intra abdominal disease. It therefore becomes exceed-

tention to the fallibility of the X-ray as a means of prognosticating results of medical treatment If improvement follows the period of bed rest which may last two to three weeks the individual returns to his work with strict instructions to continue the medical regime One of the most important considerations in the management of ulcer is the reaction of the individual to his daily duties. If the patient is comfortable and can continue his work, medical therapy is continued, but in the event that pain persists and the local gastric condition prevents the usual occupation, surgery is indicated. After a great deal of controversy it is generally accepted today that about 5 per cent of patients with gastric ulcer develop carcinoma on the basis of such an ulcer those patients who require prolonged medical treatment and who are compelled to have bedrest, it seems wiser to refer this type to the surgeon rather than run the risk of carcinomatous degeneration Furthermore the dangers of adhesions to the neighboring viscera in patients who have frequent complaints and who show upon X-ray examination an increasing deformity of the stomach call for early surgery before serious complications render surgical technique not only too difficult but too dangerous

Ulcer in the region of the cardia usually requires a more prolonged and intensive course of medical therapy than ulcer occurring elsewhere. Surgical difficulties with an operation at this site compel the physician to treat these patients for a prolonged period of time. If the patient does not respond to treatment after a reasonable length of time it seems wiser to take the risk of excising the ulcer rather than wait for complications which at times may even be beyond surgical help

Duodenal Ulcer-The individuals with duodenal ulcer present an entirely different problem than those with gastric ulcer Although both types of cases may present stigmata of disturbances in the vegetative nervous system yet it seems reasonably safe to advise against operation in patients who have simple duodenal ulcer whereas the continuance of symptoms in this type of patient who has gastric ulcer generally means surgical intervention Furthermore an individual with an ulcer of the duodenum will in the great majority of instances improve on medical therapy even while he is allowed to continue his work It is only after ambulatory treatment has failed that the patient is put to bed and a strict regime instituted It has been our experience that about 70 per cent of patients with uncomplicated duodenal ulcer will show definite and distinct improvement upon ambulatory treatment Tobacco smoking in

all forms should be strictly prohibited. Since it has been pointed out by Mayo and others that the economic factors are important considerations in the question of treatment we insist that the patient go back to work and continue his treatment as best he can before an operation is advised. Although surgery is done in a large number of individuals with duodenal ulcer who have recurrent and persistent symptoms, and who find that they are unable to carry on their duties, still we must remember that we have no criterion which will guide us in telling which patient after the operation will be well, and able to continue his These patients should be told that surgery is only one step in the treatment and care should be exercised even when they are free of symptoms after their operation

The X-ray examination, while it is an important aid in the diagnosis of ulcer, does not reveal changes which are in any way in proportion with the symptoms Stenosis of a duodenal ulcer can be recognized by the Roentgen examination, but care should be taken to exclude spasm of the pylorus which may be an associated and important factor The Roentgen Ray may show evidence of duodenal ulcer during the stage when the patient is free of all symptoms which resemble closely and perhaps all of the signs seen during the active stage. In some patients who have symptoms for years the X-rays may reveal little or no change in the deformity or contour of the duodenum and the same signs both in proportion and intensity may be seen This type of patient which forms for vears a good proportion of the duodenal ulcer patients may have temporary healing during the quiescent stage which may last months or years and then for some unknown reason develop an ulcer at the same site (locus resis-The Roentgen findings are tentia minorus) not always in proportion to the clinical symptoms

A progressing stenosing ulcer of the duodenum may also be classed in that group of cases which should be operated upon without putting the patient to a loss of time and money by prolonged medical treatment. The great problem which confronts both the internist and the surgeon is what patient should and should not be operated upon

At the Lahey clinic in Boston complete cooperation between the gastro-enterologist and the surgeon has brought about a plan of treatment which in their hands is well standardized and successful. The medical aspect follows the plan established by Sippy. After from three to four weeks rest in bed the patient is discharged and kept on a modified diet. Persistence of symptoms and evidences of an active ulcer are taken as the criteria for surgery

mal, and the intervals between contractions are much shorter, 2-Hyper-tonicity, 3-Dextro position of pylorus and duodenum, 4-Pyloric insufficiency, 5-Rapid emptying of the stomach during the early part of digestion and a small six hour residue in the stomach (paradoxical residue-Haudek), 6-Hyper Motility of the small intestines and also hyper motility of proximal colon, 7—Hyper secretion is shown as a layer of fluid less dense than the rest of the contrast (Schlesinger), 8-Gastro Spasm-Duodenal ulcer is usually-associated with some spastic manifestations of the stomach The spasm may be in the form of an hour-glass contraction It may be superficial or deep, and may occur anywhere along the greater curvature, 9—Teeth-like contractions. Schutz called attention to the occurrence of teeth-like contractions on the greater curvature in duodenal ulcer, and 10-"Cascade stomach" or "Cup and spill stomach", as termed by Barclay is due to regional spasm and is occasionally encountered in duodenal

All these indirect X-ray signs may be present in a number of other intra-abdominal diseases, and may on the other hand be absent in duodenal ulcer. One cannot discount entirely the value of these indirect symptoms but must evaluate them in conjunction with the other data gained upon examination.

If a clinical history and other findings suggest ulcer and the X-ray examination is negative, extra gastric causes for the symptoms should be investigated. Gall Bladder disease, chronic appendicitis, renal calculus, coronary artery disease, hernia and lues (either visceral or cerebro-spinal), may present gastric symptoms analogous to that of ulcer with no evident history of the real cause of the symptoms X-ray examination of the kidneys and ureter should be made before the barium meal is given so that a calculus if present be not obscured by the contrast meal

In attempting to evaluate the importance of laboratory studies in the diagnosis of ulcer of the stomach and duodenum one must be guarded Examination of the gastric contents in known and proven ulcer cases may reveal hyper, hypo, or anacidity The great majority of patients with ulcer show definitely an increase in the amount and in the concentration of hydrochloric acid Rehfuss has given us various gastric curves which appear to be fairly constant in ulcer-bearing patients persistent presence of a hypo or anacidity does not exclude ulcer. In the event that an individual with a suspicious ulcer history presents negative findings on X-ray examination and a low gastric acidity, one feels as a rule that the cause of the patient's complaints is Fractional gastric probably extra-gastric

analysis is done only in those patients who have a sub-acidity or an anacidity in the presence of definite evidence of disease

The examination of the stool for blood is carried on routinely. In the presence of a suspicious history of ulcer a persistent positive benzidine or guiac reaction will be of inestimable importance provided the individual is on a diet free of all hemoglobin substances for a continued period of time, and provided all other causes of bleeding are excluded

A blood Wassermann should be done on every patient in order to exclude lues as the causative or contributing factor in the symptomatology. An ulcer may exist in an individual who has lues, and furthermore lues of the nervous system producing bizarre gastric symptoms may exist with a negative blood Wassermann.

In the consideration of the value of the X-ray and laboratory as an aid in the diagnosis of ulcer, it is important to consider the individual type in association with the complaint

Considerations in the Treatment of Ulcer Patients

One of the most vital considerations in the treatment of ulcer patients is the location of the ulcer An ulcer in the region of the cardia, body, pylorus or duodenum will not only vary in symptomatology but also in response to treatment. Ulcer occurring either in the stomach or duodenum may be superficial, produce few symptoms, and may heal quite read-In a certain number of cases excellent results may be attended with medical treatment while in other cases surgery may yield good results The decision as to which patients should be submitted for either medical or surgical treatment is not always easily arrived at Perforation, hemorrhage, and stenosis call for surgical intervention. There remain, however, a very large proportion of ulcer patients who have none of the acute surgical calamities and who present a very serious problem

Gastric Ulcer—Ulcer of the stomach proper usually calls for complete rest in bed while the patient is under medical treatment Sippy treatment or a modified Lenhartz diet with alkaline medication, local applications of heat, and mental as well as physical rest is usually instituted In a certain number of cases trans-duodenal feeding is attendant with excellent results and improvement can be demonstrated roentgenologically as well as clinically There is some danger of drawing conclusions upon Roentgen examination, for a niche which previously existed may disappear and yet an ulcer remain unchanged in size Hollander has called atis usually gastro-enterostomy. The complications of gastro-enterostomy, such as nausea, fullness, pain, renewed ulcer symptoms, diarrhea, gastro jejunal ulcer, gastro-colic, fistula, etc, are undoubtedly familiar to all of you. In the past few years A A Berg, following in the footsteps of the European surgeons, Finsterer and Haberer, has become a staunch advocate of sub-total gastrectomy for duodenal Complications as have been menulcer tioned occurring after gastro-enterostomy, Berg shows, are avoided by this type of operation, and as a rule the patients enjoy better health largely due to the fact that the stomach has an-acid Recently Klein has shown that some of these patients who have had a sub-total gastrectomy may develop ulcer again and that not in all cases is the stomach an-acid again we find that surgery may alter the physiology but not the constitution of the patient Perhaps sub-total gastrectomy may yet prove to be the operation of choice Time alone can prove this

The advocates for gastro-enterostomy as opposed to sub-total gastrectomy are still quite numerous The support for gastro-enterostomy does not come from inexperienced surgeons in whose hands sub-total gastrectomy might be attended by a large mortality, but from many good surgeons Excellent results generally follow gastro-enterostomy for stenotic duodenal ulcer The debatable surgical question arises as to the choice of procedure in those types of cases where the lumen of the duodenum is still patent. Horsley and Finney claim good results with their pyloroplastey operation The Mayos report over 90 per cent cures with gastro-enterostomy Lewison and Ginsberg of Mt Sinai report that observation of surgically treated cases in which gastro-enterostomy was done for duodenal ulcer over a period of four to nine years showed that only 47 per cent of the cases were completely cured Nineteen per cent had fair results, while 34 per cent suffered from jejunal or marginal ulcer

Such conflicting opinions coming from reliable sources instead of clarifying the situation add to the confusion In a given case that requires surgery the answer must rest with the competent surgeon in whose hands we place The age of the individual, the the patient absence or presence of stenosis, the ability of the surgeon, all act as indications for the types of operation Following surgery the patients should return to the gastro-enterologist and despite what some surgeons maintain in allowing their patients to eat anything and everything it is most advisable to continue care in the diet and in the mode of living Tobacco is harmful in this type of individual and should be withdrawn unconditionally

SUMMARY

Ulcer of the gastro duodenal tract still remains according to Roessle a second disease.

1 e Second to some primary condition, the exact nature of which is unknown Whether the constitutional or conditional factors are responsible for the underlying cause still remains a debatable question

In the presence of an ulcer medical care is and will remain the first line of treatment Pathological statistics (Wilkie) have shown that healed ulcer may be an accidental finding in a post mortem examination. We must conclude therefore with Westphal and Katch that the syndrome of ulcer, especially duodenal ulcer is a vegetative neurotic complex.

The aids in the diagnosis and the aids in the treatment of ulcer of the stomach and duodenum are well standardized The patient, however, and not the disease, is the first consideration Treatment must be directed toward the individual primarily, and cannot always be standardized The periodicity in ulcer, the remission of symptoms in the Spring and in the Fall, are associated with emotional Are these due to disturbances of the vegetative nervous system? Is ulcer one of the penalties of civilization? The individual with an ulcer of the stomach and duodenum must continue in this active struggle of life He alone furnishes the criteria as to whether or not we are to proceed with medical or surgical therapy

Westphal and Katsch Mitteil aus den Grenzgeb, der Inn Med u Chir, vol xxvi, 1913

In the reader's opinion uncomplicated duodenal ulcer as evidenced by laboratory study always remains a medical problem. Surgery can never change the constitution of an individual although it may alter a normal physi-

ology

The frequency with which a patient develops symptoms cannot be used as a criterion for surgery. We are all aware of the fact that disturbed function is not always associated with organic disease, and further that organic disease of any viscus does not always produce a clinical symptom complex of like nature in different individuals. The adequate measures for medical treatment extend beyond rest in bed, local applications of heat and the administration of medication. As long as the etiological primary factor still remains unsolved one cannot hope for surgery to act as a curative agent.

Recently in a splendid presentation, Dr Frank Smithies gave some interesting statistics which might be summarized as follows "Assuming that in the United States at present there are sixty million individuals at or past the adolescent age, 2,200,000 of them at present harbor or at some time will be affected with peptic ulcer If all of these are treated by surgery there will be an operative mortality of at least 7 per cent, 1 e, 154,000 will die of the operation Of those with only one operation there will remain a digestive morbidity in 30 per cent, or 579,000 persons Following supposedly successful surgery 46,000 will come to at least one secondary operation

Were peptic ulcer treated wholly by surgery one could expect an annual operative mortality of 9,420, excluding deaths from hemorrhage Were all ulcers treated by non-surgical procedures, the annual mortality would be 7,200 Therefore, as a cause of disability and death, or as a field in preventive medicine peptic ulcer presents a problem commensurate with that of tuberculosis, cardiovascular disease, cancer, or

diabetes"

Bastedo rightfully informs his patients that he advises surgery, when the dangers and disadvantages of non-surgical treatment are

greater than those of surgery

Perhaps one should include under the head of medical management the removal of foci of infection. Due to the work of Rosenau of the Mayo Clinic it has been proved experimentally that there is a definite relationship between focal infection and the production of gastroduodenal ulcer. A great deal of controversy has arisen around the questions of focal infection and its relation to ulcer. Without entering into a discussion of the subject, from a practical standpoint it is not only expedient but wise to have diseased tonsils or diseased teeth removed, infected sinuses prostatic in-

fections, etc, treated in individuals who have ulcer of the stomach That focal infection undoubtedly plays a role was recently brought vividly to our attention in a patient who had a gastric ulcer Removal of two infected teetli markedly aggravated the clinical symptom of the gastric ulcer From a diagnostic standpoint the aggravation of the symptoms led me to surmise that there undoubtedly was some relationship between the infected teeth and the The irritation as the result of the extraction was in some way responsible for a local absorption of a toxin which aggravated the local gastric condition Subsequently the patient's symptoms subsided and he has remained clinically well since Such cases are indeed rare, but that they do occur is sufficient proof in sustaining the physician in advising removal of diseased foci Like most others in the profession I feel that the indiscriminate operation upon tonsils and teeth is to be condemned

As has been mentioned above, operation is favored at the outset in those cases with obstruction, with frequent hemorrhages, and in those having perforating or penetrating ulcers Medical treatment in such individuals cannot be justified If the patient refuses to cooperate or if after good medical treatment and conscientious adherence to all precepts laid down, we are without results and pain persists, then surgery is recommended. One should always advise the patient that the operative procedure is just one step in the treatment. It may be that the patient may get entirely well but on the other hand, and not infrequently, the patient is but slightly improved. In a certain proportion of cases surgery does not relieve the symptoms but may actually create a worse state than had existed prior to the operation

Following the operation for gastric ulcer, whatever the procedure may be, we must accept the result with optimism. The fact that medical treatment has failed and the fact that surgery may fail is an additional proof of our ignorance concerning the pathogenesis of this disease.

The fact that operation for uncomplicated duodenal ulcer may create a state of affairs much worse than existed heretofore leads me to advise this type of patient to undergo frequent medical treatment with perhaps rest in bed for one week every few months, rather than take the risk of becoming a chronic in-The surgeons not valid following operation infrequently tell us that they operate upon patients who have been repeatedly "cured" of a duodenal ulcer by so many qualified gastro-en-But what of the surgical failures terologists in whom no amount of treatment can even produce the so-called "medical cure?"

The surgical treatment for duodenal ulcer

THE GRIEVANCE COMMITTEE

The enforcement of the New York State Medical Practice Act of 1926 is in the hands of the State Department of Education and the State Attorney General Neither of the physicians of the State, nor the Medical Societies are charged with enforcing the law, although many persons think that they are, owing to the provision for an official Grievance Committee composed of ten physicians

The subject of the powers and duties of the Grievance Commitee has also been given wide publicity in recent newspapers owing to court investigations of ambulance chasing, especially testimony that a ring of physicians is engaged in giving false testimony regarding injuries claimed under the Workmens' Compensation law suggestion is made in several newspapers that charges of illegal practice by physicians should be brought to the attention of the Grievance Committee, the assumption evidently being that the committee initiates investigations and conducts hearings on its own accord.

While the Grievance Committee is composed of physicians, it does not represent the Medical Society of the State of New York, or any of its component societies It is an integral part of the State Department of Education, and is under the control of that Department

The Medical Practice Act is a part of the Education Law of New York State and comprises sections 1250 to 1266 inclusive of Article 48 of that law The part relating to the Grievance Committee is section 1265 which is entitled "Procedure in Disciplinary Proceedings" law first provides for the appointment of the Committee and then defines its jurisdiction as follows

"The members of said committee shall have jurisdiction to hear all charges against duly licensed physicians of this state for violation of the provisions of section twelve hundred and sixty-four hereof, except subdivision one."

That part of Section 1264 to which the quotation refers reads as follows

- "(a) That the physician is guilty of fraud or deceit in the practice of medicine or in his admission to the practice of medicine
- (b) That a physician has been convicted in a court of competent jurisdiction, either within or without this state, of a crime or misdemeanor,
- (c) That a physician is an habitual drunkard, or addicted to the use of morphine, cocaine or other drugs having similar effect, or has become insane, or
- (d) That a physician is guilty of untrue, fraudulent, misleading or deceptive advertising, or advertising that he can cure or treat disease by a secret method, procedure, treatment or medicine, or that he can treat, operate and prescribe

for any human condition by a method, means or procedure which he refuses to divulge upon demand to the committee on grievances, or

(e) That a physician did undertake or engage in any manner or by any ways or means whatsoever to procure or to perform any criminal abortion or to violate section eleven hundred and forty-two of the penal law"

The law further provides for the voluntary submission of disputes for arbitration as follows

"Any controversy between two or more physicians, or between a physician or physicians and another person, which said parties to such controversy agree to submit to arbitration, may be submitted in writing to said Committee on Griev-

The law does not specify the manner by which cases are referred to it, but subdivision 10 reads

"Said committee shall have power to make such rules and regulations for the conduct of its business as it shall deem necessary, provided such rules and regulations do not conflict with any of the provisions of this article"

Acting under this provision of the law, the Committee has adopted the procedure of acting on those cases which have come to it through the Department of Education The peculiar field of activity of the committee comprises medical ethics and medical practice,—questions which are of a professional nature. The Regents of the Department of Education look to physicians on the committee to advise them whether or not the charges against a physician constitute an infraction of the standards of the medical profession

The law makes a provision that a subcommittee of the Committee on Grievances may hear complaints and take evidence The committee has therefore divided itself into four groups,—a Western, a Mid-state, an East-central, and a Southern,—for the more convenient hearing of cases (See this Journal, September 15, 1926, page 802) The subcommittees report to the entire committee, and it in turn reports to the Regents

The Committee on Grievance has no power to punish a physician whom it adjudges guilty, but such power lies with the Regents However, the law reads

"If the practitioner is found not guilty, said committee shall order a dismissal of the charges, and the exoneration of the accused"

The law, subdivision 11, further reads

"The said committee shall have power where a proceeding has been dismissed, either on the ments or otherwise, to relieve the accused from any possible odium that may attach by reason of the making of charges against him, by such public exoneration as it shall see fit to make if requested by_the accused so to do"

It will thus be seen that the Committee on

CYCLE OF ADMINISTRATION

The Medical Society of the State of New York has just completed a yearly cycle of administration and made preparations for a new series of activities.

The outstanding event of the past year was the development of agreements with representatives of voluntary health organizations regarding the peculiar fields of physicians and lay workers

The major problem during the coming year will be the development of a balanced program for the work of the several departments of the State Society The most significant step has been the appointment of a committee on the annual meeting, for the yearly convocation is the concrete expression of the achievements and aspirations of the official medical societies

MEDICAL PROGRESS

Evils of Too Much Milk -The majority of mothers think that milk is the best of all foods for children and the majority of physicians advise this without limitation. To support his contention that this is a mistake Eugene Rosamond cites a number of cases in which the giving of too much milk was the cause of the complaint for which medical advice was The outstanding symptoms in these cases were constipation, fretfulness, wakefulness at night, slight anemia, pot belly, and foul breath, though not all the symptoms were present in every case In addition to other articles of diet suited to their ages, these children were taking large amounts of milk-from a quart to When the excess amount of five pints daily milk was removed from the diet the children rapidly returned to normal When a baby who is drinking too much milk fails to thrive, it is not because of idiosyncrasy to milk, or because of mability to digest milk, but because he is too full of a food insufficient in caloric value, and hence has no appetite for other foods needs concentrated food and also food which leaves more solid waste so as to relieve the constipation -Southern Medical Journal. May. 1928, xxı, 5

Dieting the Corpulent -After pointing out the disadvantages of carrying a burden of dead weight, W F Christie reminds us that, since fat comes from food, the plump person need only diet to stop it—the sooner the better Those suffering from what will become wasting disease, the mentally weak, the melancholic, and the markedly neurasthenic are unsuitable subjects for a reducing cure are diets which reduce rapidly and others which reduce slowly The devotee of speed in losing weight neither looks so well nor feels so fit as the man who takes it off more slowly rapid reduction method starts with a dose of calomel at night, followed by a Seidlitz powder in the morning, no solid food is allowed for three days, but water is taken ad lib few days on a diet which gets rid of the acidosis, a second fast is instituted, which is again stopped on the appearance of acetone bodies It will be found that the body acquires the power, in an increasing degree, of oxidizing the products of breaking-down fat, with the result that each fast can be lengthened After the three days fast the patient may be put on a semi-starvation diet, such as the "milk and potato cure," which has an approximate caloric value of 750, and is continued for twen-

ty-one days, when other foods may be recommended gradually With a slow reducing diet one or two pounds per week may be lost diet must be adapted to the individual requirement is met to some extent by the use of a "skeleton diet," to which may be added as occasion demands one or more items from a graded list of foodstuffs The skeleton diet has a caloric value of about 1,200, with a high protein and a low carbohydrate and fat content The total quantity of these articles permitted is 4 ounces of bread, 1 ounce of butter and 4 ounces of milk per day After the loss of 18 pounds the patient is advised to return to a maintenance diet for a month —Practitioner. May, 1928, ccx, 5

Backache - John William Shuman emphasizes the fact that, unless a correct diagnosis is made of the cause, the treatment of backache will not be successful In order to determine the etiology the following conditions should be considered (1) Disease per se-chronic vertebral arthritis, lumbar myositis. Pott's disease or tuberculosis, scoliosis and other deformities, sacroiliac arthritis and subluxation. and malignancy, (2) conditions resulting from injury-fractures, sprains and strains, dislocations, and contusions, (3) faulty posture—flat feet, short legs from fractures, poliomyelitis or osteomyelitis, protuberant abdomen, ankylosed knee or hip, (4) acute infectious diseases, such as influenza, smallpox, and typhoid fever Chest conditions which cause backache are (1) Lung infections, acute and chronic, including pleurisy, and neoplasms, (2) heart disease —failing heart, angina pectoris from coronary sclerosis and aneurysm Backache is one of the earliest symptoms of myocardial insufficiency, the pain is usually in the left scapular region and is most marked after exertion Abdominal conditions which produce backache include gallstone colic and gallbladder disease, hepatitis, abscesses, cysts, and malignancy of the liver, ulcer of the stomach and malignancy of that viscus, appendicitis, colitis, diverticulosis, visceroptosis, and hernia, pancreatitis, adhesions, kidney diseases and pelvic diseases -uterine, ovarian and rectal An x-ray study and careful interpretation are essential when gallbladder or spinal disease is suspected as the cause of backache Focal infection may be a cause of backache from myositis The railway spine must not be overlooked -Medical Journal and Record, May 16, 1928, exxvii, 10

Grievances, as constituted by law, functions for the protection of the physician. The committee exonerates a physician when it considers the charges not proved, and it refers the case to the Regents when it considers the evidence sufficient to sustain the charges. There remain a group of

border line cases in which the physician has not practiced medicine according to the highest standards of ethics or science and yet has not violated any specific law. In these cases the committee may recommend that a reprimand be given by the Regents

DR HIDEYO NOGUCHI, MD, PhD, ScD

Dr Hideyo Noguchi, a native of Japan and one of the few scientists whose name and fame are known to every practitioner of medicine, died at Accra, West Africa, on May 21, 1928, aged 51 years, from the results of an attack of yellow fever,—the disease for whose study he had made a special trip to Africa Those who came in contact with him will retain vivid recollections of his modesty and kindliness, and his willingness to impart his great knowledge to students both in classes, in medical societies, and in private conversation

Dr Noguchi graduated in medicine from the Tokio Medical College in 1897, and worked in the Institute for Infectious Diseases in Tokio for two years He then came to the United States and was connected with the pathological

staff of the University of Pennsylvania and the Carnegie Institution until 1904, when he became one of the original members of the staff of the Rockefeller Institute in New York

The intensely practical character of Dr Noguchi's researches was a great factor in eliciting approbation and honor from practitioners of medicine. His discoveries in snake venoms, syphilis, smallpox, yellow fever, and trachoma are applied daily by physicians, while the methods of research which he developed are invaluable to all laboratory technicians. He worked and taught quietly, with no thought of glory or reward, but with the single purpose of solving some of the mysteries of common diseases. His life is an inspiration to every conscientious physician.

LOOKING BACKWARD

This Journal Twenty Years Ago

The investigations and prosecutions of illegal practitioners by the Attorney General and the Department of Education under the Medical Practice Act of 1926 are gratifying in the light of the prosecutions conducted by the Medical Societies as described in this Journal of July, 1903

"Last week a complaint was formulated against the same defendant, Francesco Tuscano, who is running a medical institute at 325 East Twelfth Street It was stated that this institute was under the supervision and protection of a physician in Brooklyn

"When the case was tried before Magistrate Breen, the doctor came forward promptly and testified that he was present in New York and examined the detective, and denied having ever seen Mr Conway, and that Mr Conway had never been in his office. He being, as far as the magistrate knew, a reputable physician, his word was taken as against the detective's and the defendant was discharged and the complaint dismissed

"The counsel of the Association, however, has drawn the affidavits of Mr Conway and

of Mr Villone, the detective, and has forwarded these affidavits to the Regents, and they have been presented by the Regents to the State Board of Medical Examiners for their action. The defendant was immediately rearrested on the 1901 complaint and waived examination, and will be tried on a near date. The Brooklyn doctor, according to the directory, is not a member of any medical organization.

"The interesting case of Carmela Rubino, of Villa avenue, Bedford Park, was sent to the office of the counsel from the District Attorney's office, upon evidence entirely outside of the State Medical Association. This woman is a fortune-teller and has been swindling the Italians of that district, who are extremely superstitious. In this particular instance she advised the withdrawal of all medicines given by doctors, and substitute a powder in their place, the patient had tuberculosis and soon died, the husband is the complainant.

"Pauline Price, of 262 Second Street, is another of the fortune-telling variety, and she was held for trial by Judge Breen, in the Fourth District Court She was fined \$15"

Seasickness and Its Treatment-It is the conviction of R. Allan Bennett that the chief cause of seasickness is anticipation, not a disturbance of the harmony that normally exists between the cerebellum, the labyrinth, the eye muscles, and their coordination in the centers The traveler who starts his journey with the intention of being seasick is seldom disappointed However, much can be done in the way of prophylaxis The traveler should practise autosuggestion for a week before sailing During this period he should take only two daily-breakfast and dinner-with bread, cheese, and an apple at midday The third day before sailing he should fast, but drink water freely That night and the following he should take a 5-grain blue pill and the next morning a Seidlitz powder or a dose of During an attack of seasickness one remedy is usually as good as another if taken with confidence. Those who are seasick should be driven from their cabins into the fresh air Hot bottles to the feet and a shade over the eyes add comfort, and there is virtue in mustard leaves over the stomach If the blood pressure falls below 105, a hypodermic injection of adrenaline, repeated if necessary, is helpful, the same is true of strychnine and cam-In cases in which exhaustion is becoming dangerous, placing the patient in a warm salt-water bath (90° to 95° F) for half an hour or longer brings prompt and remarkable relief This is not due to the general sedative effect, but to the mechanical changing of the patient's The body is supported very environment. lightly on the buttocks, the shoulders, and the back of the head, with the toes just touching the end of the bath to prevent the legs from floating —British Medical Journal, May 5, 1928, 11, 3513

The Genesis of Gastric Ulcer —E M Eberts discusses the more recent views on the anatomy, physiology, and pathology of the stomach concerned in the etiology of gastric ulcer, from which he makes the following de-There are two types of erosion fundal erosions and erosions of the "gastric street" (the drainage canal lying beneath the lesser curvature) The former develop particularly as the result of venous stasis and the spasmodic efforts of vomiting, the latter generally as the result of arterial obstruction, due to muscular spasm, or more rarely as the result of emboli or arteriosclerotic change Fundal erosions, because of their small size, the redundancy and laxity of the mucous membrane, and the lesser concentration of the gastric juice in the zone bordering upon the greater curvature, tend to heal promptly, whereas "street" erosions, because of their large size, their tendency to gape, their location in a zone of

peristaltic unrest, and their longer exposure to a concentrated gastric juice, are less likely to heal, and it is in this type of erosion that the chronic gastric ulcer of the lesser curvature has its origin Gastic ulcers which show no improvement after six weeks bed rest under medication and a suitable diet should be ex-Surgical treatment aims to meet two conditions—the removal of the lesion and the prevention of recurrence To this end the pylorus and the greater part of the lesser curvature must be removed in order to eliminate or to curtail adequately hydrochloric acid secre-This procedure is not as formidable as it sometimes appears to be, for in dilated stomachs extensive resection may be performed without actual encroachment upon the corpus -Canadian Medical Association Journal, May, 1928, xviii, 5

The Carotid Sinus Reflex -Z Tomanek refers to recent accounts of this phenomenon and proffers some experience of his own in this province which was obtained in the clinic of Professor Rencki in Lvov Pressure was exerted on the carotid sinus in 40 subjects both normal and pathological, and at the same time the blood pressure in the brachial artery was taken with a Riva-Rocci apparatus previously obtained by Hering were partly confirmed In 19 patients there was a fall of blood pressure, in 11 an elevation, and in 7 no reaction of any kind. In the 3 remaining cases the result was indecisive. The maximum lowering obtained was 125 per cent save in the case of a patient with cholecystitis in whom the pressure was lowered 16 per cent In 3 cases lowering was obtained only by pressure over the left side of the neck. The greatest elevation of pressure was but 87 per cent and is therefore of little significance. The results obtained by Hering showed much greater reductions and no elevations Danielopolu, however, has occasionally obtained elevations thereby corroborating the author indecisive cases there was a sort of amphoteric response, pressures showing both elevation and depression, and Danielopolu has also called attention to this sort of behavior, which shows a natural tendency to vary in both directions -Klimsche Wochenschrift, May 6, 1928

How Does Liver Therapy Benefit Pernicious Anemia?—H Schulten of Professor Schottmüller's internist clinic at Hamburg asks this question and attempts to answer it by the results of research undertaken with the aid of the Rockefeller Foundation. He concludes that the improvement which follows the liver treatment coincides with an increase in the regenerative power of the blood, but denies that the benefit accrues from this factor.

Kummell's Disease — J Cardis, G F Walker. and R H Oliver, writing in the British Journal of Surgery, April, 1928, xv, 60, report 14 cases of the disease first described by Kümmell in 1894, and which has hitherto not been recogmized in the ordinary text books. The disease may be defined as the delayed crumpling and collapse of the body of a vertebra following injury In the typical case, after an injury to the spine, the patient may be incapacitated for a short time owing to bruising, with diffuse or localized pain, and in the more severe cases girdle and limb pains There may also be locomotor trouble ranging from slight leg weakness to total paraplegia with sphincter paralysis After a short interval these symptoms regress and the patient may be able to resume his ordinary occupation Then, after weeks or even years, there is a return of the pain and sometimes of the symptoms referable to cord interference Examination may reveal a spinal deformity, usually, though not invariably, angular in type Kummell's disease should always be thought of in cases of slight injury in which there is undue persistence or recurrence of symptoms The medicolegal aspects of the latent period should not be ignored by those who come in contact with the Workmen's Compensation Act Radiography is all important, though a negative finding is inconclusive in the early stages The disease must differentiated from sımple contusions, strains neuroses, traumatic myelitis, syphilitic spondylitis, rheumatoid arthritis, and Pott's disease The differentiation from Pott's disease is difficult, but in Kummell's disease the patient is in other respects healthy, there is no abscess formation, and the roentgenogram shows a wedge-shaped vertebra, with possibly a fracture, but with clear edges and intact discs the treatment the object is to secure ankylosis of the spine and welding by callus It is therefore essential to secure rest for the spine and to relieve pressure on the crushed vertebra by extension or by some form of corset or plaster tacket worn continuously for long periods

Dangers of Curettage of the Uterus—H Runge of the Gynecological Clinic of Kiel University says that this operation is now regarded as safe and without noteworthy morbidity, but adds that the statement is true only if the indication is properly fixed and the requisite preparatory treatment carried out. It is indicated in incomplete abortion and post-abortion endometritis, while in numerous other conditions it has special indications, so that cases A third use is in must be carefully selected biopsies for diagnosis, and here too there are certain conditions to be fulfilled The author believes that only in metrorrhagias is a diagnostic curettage of quite certain assistance

Before a curettage is undertaken we should exclude the likelihood of adnexal disease, for inflammation of the appendages is a certain contraindication This can be accomplished by study of the temperature, leucocyte count, and sedimentation blood test, in association with bimanual palpation to exclude tumors and infiltrates in the lesser pelvis. The uterus should move with the portio, the parametria should be soft to palpation and if the bimanual examination is difficult these tests may decide the question, but examination under narcosis should be undertaken if any doubt remains Inflammatory changes, especially if due to gonorrhea, when present in the lower birth tract also contraindicate and the urethral secretion should always be examined for gono-The author shows by cases the unwisdom of curettage where the cervix has been dilated for if there are any infectious organisms in the cervix the process will ascend, this is very likely to occur in cases where the cervix has been dilated to curette out a polypus—Deutsche medizinische Wochenschrift, April 20, 1928

Perforation of the Uterus -R. Mandelbaum reports an unusual case of this accident as follows He was summoned by a very experienced colleague who feared that in the interruption of a pregnancy he had perforated the uterus with a curette The indication for the therapeutic abortion was tuberculosis and it had been duly authorized by a committee who also counselled sterilization The doctor however would not attempt the latter and merely dilated the cervix and applied the curette, gestation being apparently at the beginning of the third month The suspicion of perforation was based purely on the feel of the curette The accident occurred immediately upon introduction and the intervention was at once broken off woman was given hypophysis extract and placed in bed As a result of the consultation, after a delay of 12 hours, the symptoms consisting only of slight pain and elevation of temperature, the abdomen was opened in the midline below the navel and blood clots were found, but no free blood and no sign of beginning peritonitis The fundus uteri was intact but when the organ was hooked and lifted up the perforation was found opposite the internal os, closed almost hermetically by a clot the size of a cherry Instead of an ordinary fundal perforation the practitioner had made a false passage in entering the dilated cervix The operation of supravaginal amputation of the uterus was carried out with the usual measures to prevent infection The temperature, already elevated, came down to normal on the fourth day -Münchener medisimsche Wochenschrift, April 27, 1928

LEGAL

By LLOYD PAUL STRYKER, ESQ Counsel Medical Society of the State of New York

REPREHENSIBLE PRACTICES

With the descriptive words, "Dirty Business," Mr Justice Holmes of the United States Supreme Court recently characterized the criminal conduct of certain Federal prohibition agents in the State of Washington These agents deliberately violated a criminal statute of that State, which declares that a person intercepting a message over a telephone line is guilty of a misdemeanor Running over a period of many months, these prohibition agents tapped the telephone wires of Roy Olmstead and others, and made stenographic reports of their eavesdropping, as a result of which he and his associates were indicted and convicted of a conspiracy to violate the National Prohibition Act An appeal was taken to the United States Supreme Court, where the sole question presented was whether the use of the evidence of these private telephone conversations between the defendants and others which had been intercepted by means of wire tapping amounted to a violation of the Fourth and Fifth Amendments of the United States Constitution

The Fourth Amendment provides that "The right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation and particularly describing the place to be searched and the persons or things to be seized" The Fifth Amendment provides "No person * * * shall be compelled, in any criminal case, to be a witness against

The espionage in this case was effected by inserting small wires along the ordinary telephone wires from the residences of four of the defendants and those leading from the chief office The wire tapping was not made through a physical trespass upon the property of the defendants, the wires were tapped in the basement of the large office building where they had one of their The wire tapping from the house lines was made in the streets near the houses vote of five to four, the Supreme Court decided that this evidence was admissible, and that the Fourth and Fifth Amendments to the Constitution the prevailing opinion, dissenting opinions were filed by Mr Justice Holmes, Mr Justice Branders, Mr Justice Butler and Mr Justice Stone

This case, no doubt, will be pointed to by future judges, lawyers, publicists and historians as one

of the most important constitutional decisions ever made by our greatest Court When perhaps a quarter or a half a century from now, our personal rights and liberties have been wittled down by constitutional amendment, constitutional interpretation or by statute to a point now undreamed of, further historians may point to this case as marking the beginning of the decline in

American personal liberty

In the prevailing opinion, the Chief Justice gives to the Fourth and Fifth Amendments of the Constitution a literal and a strict interpretation He says, for instance, that there is no analogy between the rifling by a government agent of a sealed letter and the tapping of a telephone wire "The letter is a paper," said the Chief Justice, "an effect, and in the custody of a government that forbids carriage except under its protection The United States takes no such care of telegraph or telephone messages as of mailed sealed let-The Amendment does not forbid what was done here There was no searching There was no seizure The evidence was secured by the use of the sense of hearing and that only was no entry of the houses or offices of the de-The language of the Amendment cannot be extended and expanded to include telephone wires reaching to the whole world from the defendant's house or office The intervening wires are not part of his house or office any more than are the highways along which they are stretched"

Under the laws of the State of Washington, any one who intercepts "a message over any telegraph or telephone line * * *" is guilty of a misde-The evidence, therefore, obtained in this case was secured through the misdemeanors of national prohibition agents. It is not even certain that these prohibition officers could be prosecuted for their crimes under that section, masmuch as they are Federal officers The Chief Justice avoids answering that question by the "Whether the State of Washington statement may prosecute and punish Federal officers violating this law and those whose messages were intercepted may sue them civilly is not before us"

At common law papers and others subjects of evidence were admitted in evidence against the party from whom they were obtained, irrespective of the fact that they were secured un-"The court," said Mr Greenleaf, "will not take notice how they were obtained, whether lawfully or unlawfully, nor will it form an issue,

For when the hemoglobin is steadily on the increase the regenerative power, which he says is only transitorily improved, regresses to its former value The initial increase, however, seems associated with a permanent vanishing of abnormal hemolysis, so far as indirect evidence goes, the tests for urobilin and urobilinogen in the urine becoming negative Patients begin to look healthy, often rosy, as hematin disappears and bilirubin becomes normal author therefore is unable to agree with those who hold that the chief factor in improvement is the stimulus to regeneration, but maintains that it is the arrest of hemolysis The brief stimulation of regeneration is a by-product

In another article by Tore Lind of Stockholm on the anisocytosis of pernicious anemia, the author states that the liver therapy clearly is responsible for a reduction in the count of the macrocytes although these cells do not disappear entirely even after prolonged treatment. The initial fall is the most striking part of the phenomenon and the author sees in this a criterion of the success of the treatment—Munchener medisinische Wochenschrift, April 13. 1928

Splenectomy in Pernicious Anemia - Ludwig Bohm considers this subject in part as to its bearing on the new liver diet treatment which gives promise that surgical measures in these anemias will recede greatly in importance and frequency At the same time splenectomy should still be a valuable resource in selected cases for it has been shown to be able to prolong life for many years Whether it will ever be superseded entirely is of course a moot The present liver diet may open up other possibilities and in time we may be able to determine the exact causes of these anemias and so be able to institute true preventive and curative measures The author saw but seven cases of pernicious anemia during the period 1921-1927, all apparently before the time of the Minot-Murphy diet But one of these was submitted to splenectomy and this patient survived over six years after intervention under ambulatory and at times hospital treatment Before splenectomy he had been treated by blood transfusion and arsenic He succumbed recently to a recurrence of the original symptoms, so that the operation was clearly only a palliative measure - Deutsche medizinische Wochenschrift, May 4, 1928

Prophylaxis of Rickets—After discussing the etiology of rickets, Helen M M Mackay gives as general measures of prophylaxis the following (1) The procuring by all possible means of adequate outdoor life daily for infants throughout the year, and not only in fine weather, and the exposure of the child to what sunlight is available (2) The encouragement

of breast feeding (3) The inclusion in the ordinary diet of infants and children not on the breast of an adequate amount for their age of those-foods containing vitamin D, namely, milk, eggs, and meat Specific measures consist in supplying a substance rich in vitamin D by mouth in the form of cod-liver oil, or cod-liver oil and malt for older children, or in exposing the child to an artificial source of ultraviolet light, and so bringing about the formation of vitamin D in the body To supply the vitamin by mouth is simpler and more economical The author has been unable to demonstrate any significant difference in rate of growth, hemoglobin content of the blood, or liability to intercurrent illness between a group of infants getting light therapy as well as codliver oil and another group treated with cod-It therefore seems that the liver oil alone administration of cod-liver oil should be the routine method of prophylaxis Certain concentrated forms of vitamin D-both extracts of cod-liver oil and ergosterol activated by irradiation—are now on the market While it is probable that in the future some such preparation will have a wide field of usefulness, codliver oil of a good brand is far preferable at the present time Specific prophylactic treatment should be given to all artificially fed infants, should be given to all artificially fed infants— Lancet, May 5, 1928, ccxiv, 5462

Resources of Modern Drug Therapeutics -Prof H Handovsky of Gottingen believes that we are advancing notably from empirical beginnings to the scientific application of drugs, along three distinct lines, viz, the clinic, the experimental laboratory, and the natural development of organic chemistry Collaboration in these fields is necessary but in the last analysis it is the clinician who dominates, for it is he who inspires the research man and the chemist to certain efforts What the author terms the "chronic" experiment is of the greatest significance, as shown in the discoveries relating to vitamins, cancer, diabetes and insulin, the liver extracts in anemia, etc. The "acute" experiment is much less productive of results work of the laboratory chemist in producing synthetic drugs for special purposes, as to lessen toxicity, and to give a more intense or sustained action or exert a specific activity, is well known, as is also the isolation of active principles in a pure state Quite different in character is the research in physical chemistry in which the aim is isolation of mechanical from so-called vital elements We may study actual cells in this respect, especially with regard to arresting their power of proliferation or of destroying them without injury to the tissues at large In this connection we may cite tissue culture in intro Deutsche medizinische Wochenschrift, April 13, 1928

investigation, to give testimony which might tend to show that he himself had committed a crime The privilege is limited to criminal matters, but it is as broad as the mischief against which it seeks to guard"

Again referring to the spirit and purpose of the founders, Mr Justice Brandeis declares makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness They recognized the significance of man's spiritual nature of his feelings and of his intel-They knew that only a part of the pain, lect pleasure and satisfactions of life are to be found in material things They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations They conferred, as against the Government, the right to be let alone—the most comprehensive of rights and the right most valued by civilized men. To protect that right, every unjustifiable intrusion by the Government upon the privacy of the individual, whatever the means employed, must be deemed a violation of the Fourth Amendment. And the use, as evidence in a criminal proceeding, of facts ascertained by such intrusion must be deemed a violation of the Fifth"

In the case at hand, the evidence which the government obtained was secured by the crimes of its officers committed on its behalf "The evidence obtained by crime," Judge Brandeis declared, "was obtained at the Government's expense, by its officers, while acting on its behalf, the officers who committed these crimes are the same officers who were charged with the enforcement of the Prohibition Act, the crimes of these officers were committed for the purpose of securing evidence with which to obtain an indictment and to secure a conviction *** The terms of appointment of federal prohibition agents do not purport to confer upon them authority to violate any criminal law *** And if this Court should permit the Government, by means of its officers' crimes, to effect its purpose of punishing the defendants, there would seem to be present all the elements of a ratification If so, the Government itself would become a lawbreaker * * Decency, security and liberty alike demand that government officials shall be subjected to the same rules of conduct that are commands to the citizen government of laws, existence of the government will be imperilled if it fails to observe the law scrupulously Our Government is the potent, the omnipresent teacher For good or for ill, it teaches the whole people by its example. Crime is contagious If the Government becomes a lawbreaker, it breeds contempt for law, it invites every man to become a law unto himself, it invites anarchy To declare that in the administration of the criminal law the end justifies the means-to declare that the Government may commit crimes in order to secure the conviction of a private criminal—would bring terrible retribution

Against that permicious doctrine this Court should resolutely set its face"

By a vote of but one Justice, however, the Court refused to set its face against that doctrine

The opinion of Mr Justice Branders is far more than a mere cold, legal document. It is a philosophical exposition of the principles of liberty as guaranteed by the Constitution "To prove its case," he declared, "the Government was obliged to lay bare the crimes committed by its officers on its behalf" The Government was required not only to lay bare these crimes, but to rely upon them, and to use them in order to secure a conviction against the defendants The only theory upon which this was justifiable is the principle that "The end justifies the means" But that is a dangerous, and unsound and an immoral principle It is however, unfortunately a principle all too frequently relied upon in connection with the attempted enforcement of the National Prohibition Act It is a principle which zealots and reformers of all ages have invoked. It is a principle whose logical consequence is the destruction of all rights and all liberties in order to obtain some fancied good

"Applying to the Fourth and Fifth Amendments the established rule of construction," said Mr Justice Brandeis, "the defendants' objections to the evidence obtained by wire-tapping must, in my opinion, be sustained. It is, of course, immaterial where the physical connection with the telephone wires leading into the defendants' And it is also immaterial premises was made that the intrusion was in aid of law enforcement. Experience should teach us to be most on our guard to protect liberty when the Government's purposes are beneficient. Men born to freedom are naturally alert to repel invasion of their liberty by evil-minded rulers The greatest dangers to liberty lurk in insidious encroachment by men of zeal, well-meaning but without understanding"

He dissented further upon the ground that irrespective of the constitutional amendments, the Government should not use in the prosecution against any of its citizens evidence obtained through the crimes of its officers "But I think, as Mr Justice Brandeis says," declared Mr Justice Holmes in his dissenting opinion, "that apart from the Constitution the Government ought not to use evidence obtained and only obtainable by a criminal act. * * * I think it a less evil that some criminals should escape than that the Government should play an ignoble part. For those who agree with me no distinction can be taken between the Government as prosecutor and the Government as judge If the existing code does not permit district attorneys to have a hand in such dirty business it does not permit the judge to allow such inequities to succeed"

In the dissenting opinion of Mr Justice Butler there is a paragraph of especial interest to phy794 LEGAL

to determine that question" The Chief Justice declared that the common law should apply masmuch as the Fourth and Fifth Amendments to the Constitution were not applicable

Possibly as a suggestion to some future Congress, however, the learned Chief Justice remarked "Congress may of course protect the secrecy of telephone messages by making them, when intercepted, inadmissible in evidence in Federal criminal trials, by direct legislation, and thus depart from the common law of evidence"

Any layman or lawyer would hesitate to express his criticism of the Court's decision in language as complete, as pointed and as scathing as that employed in some of the opinions of the dissenting Justices. The language used by Mr Justice Brandeis will perhaps some day be quoted and referred to with as much enthusiasm and approval as is now employed concerning the great dissenting opinion of Justice Benjamin R. Curtis in the Dred Scott case.

At the time of the adoption of the Fourth and Fifth Amendments, he said "Force and violence were then the only means known to man by which a government could directly effect self-incrimina-It could compel the individual to testify a compulsion effected, if need be, by torture could secure possession of his papers and other articles incident to his private life—a seizure effected, if need be, by breaking and entry Protection against such invasion of 'the sanctities of a man's home and the privacies of life' was provided in the Fourth and Fifth Amendments by But 'time works changes, specific language. brings into existence new conditions and pur-Subtler and more far-reaching means of invading privacy have become available to the Government Discovery and invention have made it possible for the Government, by means far more effective than stretching upon the rack, to obtain disclosure in court of what is whispered in the closet"

Mr Justice Brandeis discusses the very nature and purpose of the Constitution, calling attention to the fact that since the days of Chief Justice Marshall, this Court "has repeatedly sustained the exercise of power by Congress, under various clauses of that instrument, over objects of which the Fathers could not have dreamed * * * Clauses guaranteeing to the individual protection against specific abuses of power, must have a similar capacity of adaptation to a chang-'Time works changes, brings into ing world existence new conditions and purposes fore a principle to be vital must be capable of wider application than the mischief which gave This is peculiarly true of constituit birth tion'"

It is, however, not only to the present that the Courts must look in their interpretation of our fundamental law, but to the future also "The progress of science," he says, "in furnishing the

Government with means of espionage is not likely to stop with wire-tapping. Ways may some day be developed by which the Government, without removing papers from secret drawers, can reproduce them in court, and by which it will be enabled to expose to a jury the most intimate occurrences of the home Advances in the psychic and related sciences may bring means of exploring unexpressed beliefs, thoughts and emotions" Quoting from the leading case of Boyd against United States, he declared that the principles affecting the very essence of constitutional liberty and security "apply to all invasions on the part of the Government and its employes of the sanctities of a man's home and the privacies of life It is not the breaking of his doors, and the rummaging of his drawers, that constitutes the essence of the offence, but it is the invasion of his indefeasible right of personal security, personal liberty and private property, where that right has never been forfeited by his conviction of some public offence, * * * Breaking into a house and opening boxes and drawers are circumstances of aggravation, but any forcible and compulsory extortion of a man's own testimony or of his private papers to be used as evidence of a crime or to forfeit his goods, is within the condemnation" of the Fourth and Fifth Amendments

What difference is there between breaking open a man's mail and breaking in upon his private conversation which he holds in his own home with a person elsewhere, but connected with him through the instrumentality of the telephone? "The mail" said Mr Justice Brandeis, "is a public service furnished by the Government The telephone is a public service furnished by its authority There is, in essence, no difference between the sealed letter and the private telephone message. * * * The evil incident to invasion of the privacy of the telephone is far greater than that involved in tampering with the mails Whenever a telephone line is tapped, the privacy of the persons at both ends of the line is invaded and all conversations between them upon any subject, and although proper, confidential and privileged, may be overheard Moreover, the tapping of one man's telephone line involves the tapping of the telephone of every other person whom he may call or who may call him As a means of espionage, writs of assistance and general warrants are but puny instruments of tyranny and oppression when compared with wire-tapping"

The Fourth and Fifth Amendments to the Constitution should not receive, declares this great dissenting opinion, a mere literal interpretation, and indeed an analysis of previous decisions shows that the Supreme Court repeatedly has refused to construe them in a narrow or a limited spirit, but has interpreted them instead in the light of the object for which they were designed That object was to "insure that a person should not be compelled, when acting as a witness in any

investigation, to give testimony which might tend to show that he himself had committed a crime The privilege is limited to criminal matters, but it is as broad as the mischief against which it seeks to guard"

Again referring to the spirit and purpose of the founders, Mr Justice Brandeis declares "The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness They recognized the significance of man's spiritual nature of his feelings and of his intel-They knew that only a part of the pain, pleasure and satisfactions of life are to be found in material things They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations They conferred, as against the Government, the right to be let alone—the most comprehensive of rights and the right most valued by civilized men To protect that right, every unjustifiable intrusion by the Government upon the privacy of the individual, whatever the means employed, must be deemed a violation of the Fourth Amendment And the use, as evidence in a criminal proceeding, of facts ascertained by such intrusion must be deemed a violation of the Fıfth"

In the case at hand, the evidence which the government obtained was secured by the crimes of its officers committed on its behalf "The evidence obtained by crime," Judge Brandeis declared, "was obtained at the Government's expense, by its officers, while acting on its behalf, the officers who committed these crimes are the same officers who were charged with the enforcement of the Prohibition Act, the crimes of these officers were committed for the purpose of securing evidence with which to obtain an indictment and to secure a conviction *** The terms of appointment of federal prohibition agents do not purport to confer upon them authority to violate any criminal law *** And if this Court should permit the Government, by means of its officers' crimes, to effect its purpose of punishing the defendants, there would seem to be present all the elements of a ratification If so, the Government itself would become a lawbreaker *** Decency. security and liberty alike demand that government officials shall be subjected to the same rules of conduct that are commands to the citizen In a government of laws, existence of the government will be imperilled if it fails to observe the law scrupulously Our Government is the potent, the omnipresent teacher For good or for ill, it teaches the whole people by its example. Crime is contagious If the Government becomes a lawbreaker, it breeds contempt for law, it invites every man to become a law unto himself, it invites anarchy To declare that in the administration of the criminal law the end justifies the means—to declare that the Government may commit crimes in order to secure the conviction of a private criminal—would bring terrible retribution

Against that permicious doctrine this Court should resolutely set its face"

By a vote of but one Justice, however, the Court refused to set its face against that doctrine

The opinion of Mr Justice Brandeis is far more than a mere cold, legal document. It is a philosophical exposition of the principles of liberty as guaranteed by the Constitution "To prove its case," he declared, "the Government was obliged to lay bare the crimes committed by its officers on its behalf" The Government was required not only to lay bare these crimes, but to rely upon them, and to use them in order to secure a conviction against the defendants The only theory upon which this was justifiable is the principle that "The end justifies the means" But that is a dangerous, and unsound and an immoral principle It is however, unfortunately a principle all too frequently relied upon in connection with the attempted enforcement of the National Prohibition Act It is a principle which zealots and reformers of all ages have invoked. It is a principle whose logical consequence is the destruction of all rights and all liberties in order to obtain some fancied good

"Applying to the Fourth and Fifth Amendments the established rule of construction," said Mr Justice Branders, "the defendants' objections to the evidence obtained by wire-tapping must, in my opinion, be sustained. It is, of course, immaterial where the physical connection with the telephone wires leading into the defendants' premises was made. And it is also immaterial that the intrusion was in aid of law enforcement. Experience should teach us to be most on our guard to protect liberty when the Government's purposes are beneficient. Men born to freedom are naturally alert to repel invasion of their liberty by evil-minded rulers The greatest dangers to liberty lurk in insidious encroachment by men of zeal, well-meaning but without understanding"

He dissented further upon the ground that irrespective of the constitutional amendments, the Government should not use in the prosecution against any of its citizens evidence obtained through the crimes of its officers "But I think. as Mr Justice Brandeis says," declared Mr Justice. Holmes in his dissenting opinion, "that apart from the Constitution the Government ought not to use evidence obtained and only obtainable by a criminal act. * * * I think it a less evil that some criminals should escape than that the Government should play an ignoble part For those who agree with me no distinction can be taken between the Government as prosecutor and the Government as If the existing code does not permit district attorneys to have a hand in such dirty business it does not permit the judge to allow such inequities to succeed"

In the dissenting opinion of Mr Justice Butler there is a paragraph of especial interest to phy-

sicians He there points out that the sanctioning of wire tapping invades the sacred confidential privilege which the law for so long has thrown around communications between patients and their "Telephones," he says, "are used physicians generally for transmission of messages concerning official, social, business and personal affairs including communications that are private and privileged—those between physician and patient, lawyer and client, parent and child, husband and The contracts between telephone companies and users contemplate the private use of the facilities employed in the service. The communications belong to the parties between whom they pass During their transmission the exclusive use

of the wire belongs to the persons served by it Wire tapping involves interference with the wire while being used"

As good citizens, we must obey and respect the decision of the Supreme Court, irrespective of the fact that it was secured by a majority of but one vote, and entirely independent of whether or not we agree with the reasoning of the great dissenting opinions in this case. But as good citizens, it is likewise our duty to observe the course of constitutional decisions, to ponder and reflect upon the trend of the times, and to form our judgments accordingly. The dissenting opinions in this case are of incalculable value for this purpose

NEGLIGENT TREATMENT OF FRACTURE OF THE ILIUM RESULTING IN TUBERCULOSIS

An employee during the course of his employment had sustained an injury and was removed to the hospital for treatment He instituted an action against the hospital and the surgeon who had treated him, and in his complaint alleged that on the 13th of February, while in the course of his employment he was working on a circular saw, which was unprotected and which struck him on the right side of his body, when the board drop on the saw kicked back, causing a fracture of the right anterior superior spine. He claimed that as such employee he was entitled to the benefits of the Workmen's Compensation Law and was sent to the defendant hospital for treatment That the defendant physician was retained by his employer to render the necessary medical care and attention to the plaintiff. That both the hospital and the surgeon were negligent and careless in their treatment of the plaintiff That they discharged him as cured when as a matter of fact he was suffering from a fracture of the right anterior superior spine and that they had failed in their treatment of the plaintiff to properly diagnose his condition and to discover the presence of the fracture That by reason of the failure to properly treat him and to discover the fracture, plaintiff contracted tuberculosis which prevented him from attending to his regular employment, and by this action he seeks to recover damages for these injuries

The surgeon in the month of February was called to attend the plaintiff who had sustained an injury during the course of his employment. Upon examination the surgeon found he was suffering from a fracture of the right anterior spine of the ilium. He at once ordered him into a hospital. The patient was put to bed and a wet dressing applied over the contused area. Thereafter he was seen daily by the surgeon.

were taken and showed the presence of a fracture of the ilium that the fragments were in good position The surgeon continued to watch the patient until the swelling went down and the abra-After this he applied an adhesive plaster dressing bandage around the body at the pelvis and kept the patient in the hospital for about two weeks, seeing him daily After leaving the hospital the patient was sent to a sanitarium for convalescence At the time he left the hospital he was able to walk. He was next seen by the surgeon about a week later when he called at the surgeon's office, at which time he was walking, but complained of pains about his body. An examination was made of the blood and sputum, but no evidence found of any disease The fracture was found to be united and in good position Thereafter he returned to the surgeon's office several time and was sent to another hospital for examination of his lungs and also to a physician specializing in lung conditions. This physician reported to the defendant that he had X-rayed and examined the plainaff, but found no evidence of tuberculosis The plaintiff then ceased to call upon the defendant physician and no further treatment was rendered by the defendant During the course of his treatment he had received workmen's compensation under the Workmen's Compensation Law When last seen by the defendant physician the fracture had grown together, there was good union and normal function and the defendant could find no reason why the plaintiff could not return to work

This action finally came on for trial and the plaintiff failing to prove that he was suffering from tuberculosis or that the defendant physician or the hospital had negligently or carelessly treated him, the trial resulted in a dismissal of the complaint by the trial court

HOUSE OF DELEGATES

MINUTES OF ANNUAL MEETING

The Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Ten Eyck Hotel, Alban, on Monday afternoon, May 21, 1928 Speaker, Dr E Eliot Harris, Vice Speaker, Dr John A Card, Secretary, Dr Daniel S Dougherty

The Speaker announced that the secretary would call the roll by counties for the purpose of determining the presence of recognized delegates. A quorum being present, the Speaker declared the House organized for

business

1 Reference Committees

The Speaker The first order of business is the report of the Committee on Credentials, Dr Dougherty

The Secretary Mr Speaker and Gentlemen, the Com-

mittee on Credentials has the pleasure of reporting that there is no duty for it to perform, as there are no disputed delegations

The Speaker The Minutes of the previous meeting having been published If there is no objection they will stand approved as printed, hearing none, it is so ordered

The Secretary I move that the reports be referred to the various Reference Committees as printed

Motion seconded and carried by unanimous vote The Secretary I also move that masmuch as the report of the Committee on Revision of the Constitution and By-Laws is a very lengthy one that the Rules of Order regarding Reference Committees be suspended as far as that report is concerned and that it be made direct to the House

Seconded and carried

The Speaker Mr Secretary, please read the Reference Committees as appointed by the Speaker

Deference Committee on the Report

The Secretary Reference Committee on the Report of the President Horace M Hicks, Montgomery, Chairman, Leo Γ Schiff Clinton, Augustus J Hambrook, Rensselaer, C Ward Crampton, New York, Lebn A Hittel Vetter John A Hatch, Yates

Reference Committee on the Reports of the Secretary, Reference Committee on the Reports of the Secretary, the Council, and the Board of Censors Charles R. Borzilleri Erie, Chairman, J. Lewis Amster, Bronx, Charles H. Goodrich, Kings Floyd S. Winslow, Monroe, Federick H. Flaherty, Onondaga Reference Committee on the Reports of the Treasurer

and Trustees Howard G Myers, New York Chairman, Eugene E. Hinman, Albany, C Knight Deyo, Dutchess-Putnam, H D MacFarland, Oneida, Joseph B Hulett Orange.

Reference Committee on the Report of the Committee on Legislation William H Ross, Suffolk, Chairman, Carl Boettiger, Queens Frederic E Sondern, New York, J Milton Mabbott, New York, Joseph P Garen,

Cattaraugus

Reference Committee on the Report of the Committee on Scientific work and the Committee on Arrangements Walter D Ludlum Kings, Chairman, Harry Aranow, Bronx, Frank M Dyer Broome, L A Van Kleeck, Nassau, Charles R. Barber, Monroe.

2 Revision of Constitution and By-Laws

The Secretary I move that before the various Committees to whom the reports have been assigned convene, we hear the report of the Chairman of the Committee on the Revision of Constitution and By-Laws as there have been some very important changes made (lournal May 1, page 512) Seconded and carried

The Secretary I move that the Chairman of the Committee on the Revision of the Constitution and By-Laws read only the sections that have been changed.

Seconded and carried.

Dr Kopetski Mr Speaker and members of the House of Delegates The report of the Committee on the Revision of the Constitution and By-Laws is in two parts one part being the Revised Constitution and By-Laws as printed and the other a supplementary report which I will now read

SUPPLEMENTARY REPORT

Amendment to Article IV "The Council shall be

composed of the President, the Secretary, the President-Elect, the Treasurer, and the President and Secre-

tary of each of the District Branches"

The Committee rejected this Amendment for the following reasons 1st. Because the Council is the adinterim House of Delegates and the proposed Amendment eliminates the officers of the House of Delegates 2nd Because it adds to the Council persons who

might not even be Delegates

Amendment to Article V "The officers of the society shall be a President, a President-Elect, two Vice-Presidents, a Secretary, an Assistant Secretary, a Treasurer, an Assistant Treasurer, a Speaker, a Vice-Speaker, five Trustees, and two Councillors from each District Branch, who shall be the President and Secretary thereof They shall be elected by the District Branch in which they reside, for a term of two years officers, except the Councillors, shall be elected for one year or until their successors have been duly chosen They shall take office at the termination of the annual meeting"

The Committee disapproved this amendment for the reasons that the Amendment of Article IV was dis-

approved

Article XI Redistrict the District Branches as fol-

First District shall include the Counties of Bronx, Dutchess, New York, Putnam, Orange, Rockland, Sulli-van, Ulster, Westchester

Second District shall include the Counties of Kings,

Nassau, Queens, Richmond, Suffolk.
Third District shall include the Counties of Albany,
Columbia, Greene, Montgomery, Rensselaer, Schenectady, Schoharie

Fourth District shall include the Counties of Clinton, Essex, Franklin, Fulton, Hamilton, Saratoga, Warren,

Washington,

Fifth District shall include the Counties of Herkimer. Jefferson Lewis, Madison, Onondaga, Oneida, Oswego, St. Lawrence.

Sixth District shall include the Counties of Broome, Chemung, Chenango, Cortland, Delaware, Otsego, Ti-

oga Tompkins

Seventh District shall include the Counties of Cayuga, Livingston, Monroe, Ontario, Schuyler, Seneca, Steuben, Wayne, Yates

Eighth District shall include the Counties of Allegany, Cattaraugus, Chautauqua, Erie, Genesee, Niagara,

Orleans Wyoming

We make no recommendations as to the changes of formation of the District Branches, except we feel that it might be advisable to accede to the wishes of Steuben County and to transfer it from the 6th to the 7th District, and the Committee feels that this would be geographically proper

Regarding the By-Laws, "Section 20 Repeal and amend to read 'It shall meet once during the months of October, December, February and April of each year the time and place to be selected by the President, and it shall meet at other times upon the request in writing of five members of the Council upon the call of the

President "

The Committee feels that this suggested amendment would impose an unnecessary burden upon the time and services of the members of the Council We recommend that two stated meetings shall be held each year and as many more as may be necessary may be held but the fixing of so many regular meetings of the Council for the whole year, we find to be unnecessary and no existing needs have arisen in the past to warrant

"Section 26 Repeal and amend "The Executive Committee of the Council shall be constituted as follows The President, the Secretary, the Treasurer and four of the eight Presidents of the District Branches, those from 1, 3, 5, 7, serving for one year and those from Districts 2, 4, 6, 8, the next. The Executive Committee

shall, when elected, organize immediately and elect a Chairman, a Vice-Chairman and a Secretary The Executive Committee shall hold regular meetings at times and in places that shall be fixed by the Chairman and at other times subject to the call of the Chairman, and any two members of the Executive Committee may require the Chairman thereof to call a meeting for such time and place as shall be designated by them in writing, of which the members shall have at least three days' notice. Four members shall constitute a quorum shall prepare a budget to be acted upon by the Board of Trustees'"

The Committee disapproves this Amendment for the

following reasons

1st. That the Executive Committee is the contractive

Board of the Council

That in order to efficiently carry on the work of the Council there should be continuity of thought and action and to have one group of men starting a series of work one year and another group of men carrying on the work another year is not conducive to efficiency in organization Familiarity with the work which develops in the Executive Committee is enhanced by continuous service. There is no advantage in having one set of District Branches serve one year and another set of District Branch Presidents serve another year

3rd, and Finally That to make the personnel of the Executive Committee mandator, precludes from the Council the possibility of appointing extra men to the Executive Committee who might be especially qualified to handle specific topics that might at various times be brought before the Executive Committee or the Council for deliberation and action

"Section 38 Repeal and amend to read "The Speaker shall preside at all meetings of the House of Delegates and shall perform such other duties as parliamentary usage may require."

The Committee approves this Amendment but has changed the verbiage and has incorporated it in the revised Constitution.

"Section 55 Add 'A Committee on Public Relations to consist of five members and the executive officer member ex-officio. The function of such committee to deliberate with other agencies both official and unofficial concerning the plans, purposes and objectives of their organizations insomuch as they have a relation to the medical profession"

The Committee approves in principle this Amendment It has changed the verbiage and has incorporated it in the Revised Constitution

The Committee does not approve the inclusion of the Executive Officer as a member of the Committee. The Executive officer is a paid official of the Society He serves all officers and all committees His services are subject to the call of this Committee and there is no necessity of his serving on it as a member of the Committee. The Committee disapproves of any paid officer of the Society holding any official office in the Society

"Section 62 Repeal and amend to read "The President shall report to the Council the committees that he shall deem expedient for the purposes of the meeting of the House of Delegates and the members of these Committees shall be elected by the Council at the meeting of that body in February preceding the meeting of the House of Delegates'"

The Committee disapproves of this Amendment for the reason it is adopting a rule contrary to Parliamentary procedure and expediency. The officers of a deliberative assembly should be active members of it appointed by the presiding officer. To give the transient officers of a deliberative assembly of the House of Delegates the status of officers of the State Society and to take care of their appointments in the Constitution other than in Parliamentary procedure is disapproved

"Section 84 Add 'Each component County Society

shall have the privilege of electing if it so desires, either a physician secretary or a lay executive secretary in either case the person so elected to be fully and completely recognized as the Secretary of the Society in all official matters wherein a Secretary shall have jurisdiction'

The Committee disapproves this Amendment because it interferes with the autonomous self-government of constituent bodies. It is not the function of the State Society to dictate what the County Societies shall do in such cases Each County Society may in its own County elect an executive officer if it so desires

"Amend the By-Laws so that the columns of the JOURNAL be always open for publication of resolutions adopted by County Societies when requested, and that on moot matters affecting the welfare of all practicing physicians of the State of New York its column be impartially open to the opponents and the proponents of

pending legislation"

The idea of publishing official communications has been accepted by the Committee and incorporated into Chapter V, Section 3, as far as the Committee deemed it wise to use the columns of the Journal for con-troversial points. We feel that, the Journal being an official organ, it should only express official opinions and unless the resolution is the official opinion of the County Society, the Journal should not be used because of the limited space allowed for the expression of private

or unofficial views
"Amend the By-Laws so that each District Branch has the power of considering the advisability of employing a field secretary to execute the detail work of component County Societies of each district."

This is disapproved as an Amendment to the By-Laws in so far as it would interfere with the home rule of the County Societies Any County Society has the right to employ any person whom they have money to pay

JOHN A CARD, J RICHARD KEVIN, HORACE M. HICKS, SAMUEL J KOPETZKY

Dr Bedell, Albany I move the adoption of this report

Seconded

Dr Goodrich, Kings It seems to us from this report that perhaps due consideration has not been given to all the suggestions that have been made and that the resolutions which have been offered for Amendments have not been considered as fully as they should be. Our delegation came to this meeting last year with what they hoped would prove to be very constructive and helpful legislation for the State Society I, therefore, move as a substitute motion that the question of the revision of the Constitution and By-Laws be rereferred to the Committee for further consideration, and that final action upon the Report of this Committee be postponed until the next meeting of the House of Delegates

The Secretary Mr Speaker, for the information of the House I wish to state that the amendments to the By-Laws are not before the House at present, merely the report of Dr Kopetzky regarding those amend-

ments

Dr Goodrich, Kings I understood the report of the Committee on the Amendments to the By-Laws was before the House for discussion.

The Speaker Not hearing the substituted motion

seconded, the matter is still open for discussion on the question of adopting the report.

Is there any further discussion on the motion? There being none, the motion before the House is that the report of the Committee on the Amendments to the By-Laws be adopted

Dr Ludlum, Kings I second Dr Goodrich's sub-

stitute motion.

The Speaker Will the Secretary kindly read the substitute motion

The Secretary "That the question of the Revision of the Constitution and By-Laws be re-referred to the Committee for further consideration, and that final action upon the report of this Committee be postponed until the next meeting of the House of Delegates

Dr Phillips, New York Does the stated motion ask for a ruling on this, because it seems to me the proper motion would have been to receive the report? Does the motion to adopt the report mean the adoption of all the

changes in the By-Laws and Constitution?

The Speaker My ruling is that the motion to adopt the report simply means the adoption of what has already been read. Is there any more discussion?

Dr Rooney, Albany I move that the report of the Committee be postponed and be made a part of the order of business under the report of the Committee on Revision of the Constitution and By-Laws, which is yet to be presented

The Speaker It has been moved a substitute for the substitute motion, that this portion of the report which is before the House be referred back to the Committee and be brought up in connection with the full report

Dr Crampton, New York I substitute for the substitute motion that we receive and accept the report as rendered and consider what we will do with it later

The Speaker The substitute substitute motion is out of order because it goes back to the original question in substance and is not changed from the original question

The Speaker The By-Laws will now be taken up

item by item

Article I of the Constitution Purposes of the Society I find nowhere in this report that the official name of this incorporated society has been mentioned and I therefore move that there be embodied in Article I, "The name of this Society shall be the Medical Society of the State of New York."

Seconded and carried

Membership No change, I move its Article II Seconded and carried

Article III House of Delegates No change move its adoption. Seconded and carried

Council No change. I move its adop-Article IV tion. Seconded and carried.

Article Officers Transpose the words Speaker and a Vice-Speaker of the House of Delegates" so they follow the words "an Assistant Treasurer" Article V will then read as follows

"The officers of the Society shall be a President a President-elect, two Vice-Presidents, a Secretary, an Assistant Secretary, a Treasurer an Assistant Treasurer, a Speaker and a Vice-Speaker of the House of Delegates, five Trustees, and one Councilor from each District Branch, who shall be the President thereof He shall be elected by the District Branch in which he re-sides for a term of two years The officers, except the councilors, shall be elected for one year or until their successors have been duly chosen. They shall take office at the termination of the Annual Meeting

I move its adoption. Seconded

There is an error in this that Dr Rooney, Albany I wish to call to the attention to the House of Delegates Article V states that the officers, except the Councillors, shall be elected for one year Article VI states that five members elected as such Trustees and the President, the Secretary and the Treasurer shall be members of the Board of Trustees without vote. In 1926 one trustee shall be elected for five years, one for four years, etc., etc. Now, they are Officers of the House of Delegates, but Articly I. The House of Delegates, in the Articly I. The House of Delegates, in the House of Del but Article V says that all officers of the House except the Councillors shall be elected for one year and the other section says that the Trustees shall be elected for five years

I, therefore, move that the section be amended by adding the word "Trustees" following the word "Councillors" The section will then read 'the Officers, except

the Councillors and Trustees, shall be elected for one

year "

The Speaker All in favor of adopting Article V of the Constitution as amended say "Aye" Seconded and Seconded and Carried

Article VI Omit the words "The Speaker" and insert the words "The Treasurer," making it read "The Board of Trustees shall consist of five members elected as such Trustees and the President, the Secretary and the Treasurer during their term of office shall be members of the Board of Trustees with voice but without vote.

"In 1926 one Trustee shall be elected for five years, one for four years, one for three years, one for two years and one for one year and thereafter, one Trustee shall be elected annually for a period of five years, and in the event of a vacancy a Trustee shall be elected for

the unexpired term"

I move its adoption Seconded

Dr Rooney, Albany I move as a substitute motion "The Board of Trustees shall consist of five members elected as such Trustees The President, the Secretary and the Treasurer during their term of office shall sit with the Trustees with voice but without vote'

Seconded

The Secretary I amend the words "during their term of office" be stricken out because they are not President, Secretary, etc., at any other time.

Dr Rooney, Albany I accept the amendment

The Secretary Now will the Chairman read Sec-

The Chairman The Board of Trustees shall consist of five members elected as such Trustees President, the Secretary and the Treasurer shall sit with the Board of Trustees with voice but without vote. One Trustee shall be elected annually for a period of five years. In the event of a vacancy, a Trustee shall be elected for the unexpired term

I move its adoption. Seconded and carried Article VII. The President, the Secretary of the Society and eight District Councillors shall be known as the Board of Censors of the Society Five Censors shall constitute a quorum The President and Secretary shall be the President and Secretary, respectively, of the Board but without vote

The Board of Censors shall meet upon the call of the President The Secretary shall prepare and submit the report of the Board of Censors to the House of Delegates In case of a tie, the President shall cast a deciding vote.

I move its adoption Seconded and carried

Article II The membership of the Society shall be

The Riest District Branch shall comprise the members of the Medical Societies of the Counties of New York, Bronx, Westchester, Rockland, Putnam, Orange, Dutchess and Richmond

The Second District Branch shall comprise the members of the Medical Societies of the Counties of Kings,

Queens, Nassau and Suffolk.

The Third District Branch shall comprise the members of the Medical Societies of the Counties of Albany, Rensselaer, Schoharie, Greene, Columbia, Ulster and Sullivan

The Fourth District Branch shall comprise the memhers of the Medical Societies of the Counties of St Lawrence, Franklin, Clinton Essex, Hamilton, Fulton, Montgomery, Schenectady, Saratoga, Warren and Washington

The Fifth District Branch shall comprise the members of the Medical Societies of the Counties of Onondaga, Oneida, Herkimer, Oswego, Lewis, Madison and Jefferson

The Sixth District Branch shall comprise the members of the Medical Societies of the Counties of Otsego,

Delaware, Chenango, Cortland, Tompkins, Schuyler, Chemung, Tioga, Broome and Steuben
The Seventh District Branch shall comprise the members of the Medical Societies of the Counties of Monroe, Wayne, Cayuga, Seneca, Yates, Ontario and Livingston

The Eighth District Branch shall comprise the mem bers of the Medical Societies of the Counties of Eric, Niagara, Orleans, Genesee, Wyoming, Allegany, Cattaraugus and Chautaugua

Sec 2 Each District Branch may adopt a constitution and by-laws for its government and may amend the same, but before becoming effective they shall be approved by the Council They shall be consistent with the Constitution and By-Laws of this Society
I move its adoption Seconded

The Secretary Mr Speaker, at the last Annual Meeting there was some discussion as to District Branches So I moved this be laid over and referred to the Committee on the Revision of the Constitution and By-Laws until we heard from the various counties All of the counties have received a communication from the Secretary telling them of this revision and asking what changes if any they desired The only change that was fairly insisted on is Steuben County, which wishes to be transferred from the Sixth to the Seventh

Ulster and Sullivan Counties expressed a wish to come into the First District
The First District Branch already comprises over half your membership. Why so enormously enlarge some Districts and lessen others? Your Comittee, therefore, did not believe that the request of Ulster and Sullivan Counties should be granted But it did believe that owing to geographical distribution and to the requests expressed by the Delegates to the House of Delegates and the Secretary of the Steuben County So ciety that Steuben County be transferred to the Seventh District, and I, therefore, move that Steuben Counv be placed in the Seventh District

Seconded and carried The By-Laws, Chapter 1, Section 1, Membership The Active members shall be all active members in good standing of the component county medical societies. A copy of the roster of such members certified to be correct by the Secretary of such county society shall be evidence of the right of the members whose names appear therein to membership in this Society No applicant shall be eligible to membership until he has established that he is of good moral and professional character and reputation, and that admission would not be prejudicial to the best interest of the Society No member who has been drapped from the roll of a component county society by reason of failure to pay dues shall be accepted by another society except by regular transfer after reinstatement in the original society

Then the rest of it is the same

I move its adoption Seconded and carried Chapter III Election of Officers Sec. 13 becomes Sec. 1, and one word added "The officers, Trustees and Chairman of standing committees of the Society," otherwise same Number 14 becomes 2, thirteen becomes 3, sixteen becomes 4 and after the end of Paragraph 16 there is this sentence "in the calendar year preceding the meeting of the House of Delegates to which they are elected "that is Section5, which I will now read to

"The delegates to the American Medical Association shall be elected in the calendar year preceding the meeting of the House of Delegates to which they are elected and in accordance with the Constitution and By-Laws of that body Delegates may be elected to other medical societies or similar bodies as the interests of the Society may require, and credentials shall be issued to all delegates, signed by the President and Secretary.

Chapter IV Council Sec. 19 becomes Sec. 1, Sec. 20 becomes Sec. 2 and reads, "It shall meet twice a year, the time and place to be selected by the President,

and it shall meet at other times upon the request in writing of five members of the Council, or upon the call of the President"

I move its adoption Seconded and carried.

Chapter V Executive Committee Sec. 1 At its first regular meeting the Council shall choose by a majority vote five members of the Council, two of whom shall be councillors, who together with the President, the Secretary, the Treasurer and the immediate past president shall constitute the Executive Committee. We had to make the Executive Committee a little larger in accordance with the amendments

I move its adoption Seconded and carried

Now, it is all the same until what was formerly Sec.

28, now Sec. 3
Sec. 3 The Executive Committee shall superintend all publications of the Society and their distribution and shall have authority to appoint an editor and such assistants as it may deem necessary and provide for the publication of official pronouncements of component county societies when requested by said society

I move its adoption Seconded and carried

No further change in that section until you come to Trustees and here again I must rely on section numbers

The Secretary In explanation I would say that there was provision at the time of the organization of the Trustees as to the method of electing or appointing of a Chairman It was decided at the organization meeting that the member of the Trustees serving his last term should hereafter be recognized as the Chairman of the Trustees Of course that was not in the By-Laws it was by resolution of the Trustees and now has to be

At the first meeting of the Board of The Chairman Trustees following the Annual Meeting of the House of Delegates, it shall organize under the chairmanship of the senior member The Board shall hold regular meetings at the time and place designated by them. Any three members of the Board of Trustees shall require the Chairman to call a special meeting at the office of the State Society for such time as shall be designated by them in writing and of which the members of the Board shall have at least seven days notice.

I move its adoption

Dr Greene, Chemung I move to amend by substituting the word two for three, making it read any two members of the Board of Trustees shall require the Chairman,

The Chairman I accept the amendment.

Seconded and carried.

Sec. 2 Add "The fiscal year shall begin July 1st and end June 30th of the following year"

I move its adoption Seconded and carried

Chapter VII Duties of Officers Add a new Section to read as follows "The President-Elect shall perform no specific duties other than those of a member of the Council but shall attend the meetings of the Executive Committee without voice or vote."

I move its adoption Seconded and carried Dr Rooncy Albany I wish to ask unanimous consent of the House after Section 7 has been disposed of to consider the first portion of Section 6

Motion seconded and carried

The Speaker Is there any objection to Dr Rooney's request to return from Sec. 7 to Chapter VI, Sec. 3?

Dr Rooney, Albany I wish to call the attention of the House of Delegates to the law in relation to membership corporations in this State which require their reports and audit shall be made by a Certified Public Accountant, registered with the State of New York. There is no provision in Section 2 of the Board of Trustees about the appropriate hard approp tees about the approved bond of Treasurer, his amount of bond and surety I, therefore, move that the words, "Certified Public Accountant licensed by the State of New York" be inserted

Motion seconded To read "The Board of Trustees shall approve the bond of the Treasurer as to the

amount, form and surety It shall employ a Certified Public Accountant licensed by the State of New York to audit the accounts of the Treasurer, Secretary," etc.

Carried

Chapter VII, Sec. 4 "The speaker shall preside at all meetings of the House of Delegates," and all the rest deleted

I move its adoption Seconded and carried

Sec. 6 "The Secretary shall attend all meetings of the Society, the House of Delegates, the Council, Board of Trustees, the Executive Committee of the Council and the Censors, and shall keep minutes of their respective proceedings in separate records. He shall be responsible for and have general charge of the Society's offices and the employees therein"

I move its adoption Seconded and carried

Sec. 8 The Treasurer shall keep accurate books of account of all moneys of the Society which he may receive, and shall disburse the same when duly authorized by the Board of Trustees, but all checks drawn by the Treasurer upon the funds of the Society shall be countersigned by the Secretary of the Society

That is the only change I move its adoption

Seconded and carried

At the end of the paragraph He shall collect, on or before the first day of June in each year, from the Treasurer of each component county society the State per capita assessment. He shall at the expense of the Society give a bond for the faithful performance of his duties, which shall be approved by the Board of Trustees as to amount, form and surety, whenever requested.

I move its adoption. Seconded and carried

Chapter VIII Traveling Expenses Substitute the word "fifteen" for the word "ten" preceding the word "dollars" Following the word "dollars" add the sentence "The President-Elect shall be allowed traveling expenses when attending Committee meetings

After the words "of these respective bodies' add a sentence "in all cases where no appropriation has been allowed a standing or special committee traveling expenses shall be allowed the individual members"

Substitute the words "\$250.00, exclusive of the work done by the Secretary regarding notices, programs, etc. for the words "not to exceed \$10000 per annum." Th

section will then read

"Allowances for expenses incurred in the actual performance of official duties by officers, Councillors and Delegates to the American Medical Association shall

be made in conformity with the following conditions "The President and the Secretary shall be allowed intrastate railroad fares and a per diem for maintenance not to exceed fifteen dollars. The President-Elect shall be allowed traveling expenses when attending commit-tee meetings. The members of the Board of Trustees, of the Council, and of the Executive Committee shall be allowed railroad fares to and from the places of meeting of these respective bodies. In all cases where no appropriation has been allowed a standing or special committee traveling expenses shall be allowed the in-dividual members. The same rules shall apply to all members when in the performance of official duties as assigned by the Executive Committee. Proper vouchers must be filed with the Secretary and approved by the Board of Trustees before any such allowance shall be made. The Delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return The vouchers of such expense shall be approved by the Board of Trustees before payment. Each District Branch shall be entitled to receive a sum of \$250 00, exclusive of the work done by the Secretary regarding notices, programs, etc., to defray the expenses of holding the annual meeting of such District Branch, provided a proper statement of such expense shall have

been presented to the Secretary and approved by the Trustees All bills, claims or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense. This time may be extended for any cause by the Board of Trustees and such extension shall not exceed ninety days'"

Dr. Rooney, Albany. As a member of the Board of Trustees and the state of the Board of the Board of Trustees and the state of the Board of t

Trustees I would like to know more about this provision relating to individual members of the Society who have been assigned certain duties by the Executive Committee being granted their traveling expenses, to know whether the House intends that the Executive Committee may assign to certain specified duties any individual member and whether the House therefore desires that this power given to the Executive Committee shall be binding upon the Board of Trustees

Dr Kevin, Kings Your Committee received this suggestion from the President Most of us do not know the amount of traveling that your President accomplishes every year, nor the immense amount of territory he desires to cover The whole purpose of this change or addition is to allow the President to appoint the President-Elect to represent him at any of the various District Branches or County Society meetings through-out the State. Your Committee considered first the advisability of giving the power to the President, then decided to place the responsibility in the hands of the Executive Committee.

Dr Ross, Suffolk If you permit the Executive Committee to authorize an expenditure without regard to the opinion of the Board of Trustees you are taking out of their hands the control of the financial expenditures for which the By-Laws make them responsible. You are also opening the door to large expenditures and remove or may remove a large part of the conservative function of the Board of Trustees

Will the Chairman of the Committee The Speaker read the Section

"The President and the Secretary The Chairman shall be allowed intrastate railroad fares and a per diem of maintenance not to exceed \$15.00. The President-Elect shall be allowed traveling expenses when attending committee meetings The members of the Board of Trustees, of the Council and of the Executive Committee shall be allowed railroad fares to and from the place of meeting of their respective bodies. In all cases where no appropriation has been allowed a standing or special committee, traveling expenses shall be allowed the individual members. The same rule shall apply to all members when in performance of official duties assigned to them by the Executive Committee and have approval by the Board of Trustees Proper vouchers, etc., etc."

I move its adoption The Chairman Dr Bedell, Albany I think the whole contention lies in the sentence, "The same rule shall apply to all members when in the performance of official duties assigned them by the Executive Committee.

The Secretary
The Speaker I move the clause be stricken out. Will the Chairman please read the

Section as amended

The Chairman "In all cases where no appropriation has been allowed a standing or special committee, traveling expenses shall be allowed the individual members of the Committee. Proper vouchers must be filed with the Secretary and approved by the Board of Trus-

I move its adoption

Chapter X, Sec. 1 Committees

Two Committees

Committees

Committees have been added, one on Public Relations and one on Medical Research

I move its adoption Seconded and carried. Sec. 2 Committee on Scientific Work. No change I move its adoption Seconded and carried Sec. 3 Committee on Legislation. No change. I move its adoption Seconded and carried Sec. 4 Committee on Public Health and Medical Education No change. I move its adoption Seconded and carried Sec. 5 Committee on Medical Economics change.

I move its adoption Seconded and carried

Sec 6 (New Section)
"The Committee on Public Relations shall consist of five members, including the Chairman It shall be the function of this Committee to deliberate with other agencies, both official and unofficial, concerning the plans, purposes and objectives of their organizations insofar as they have a relation to the medical profession."

I move its adoption.

Dr Rooney, Albany I think there should be a provision added to this Section because this Committee will be one of the most important ones of this House in the future, and the provision should be, in my opinion, that no agreement entered into by this shall be binding upon the House until confirmed by the House of Delegates I therefore move to amend this Section by adding, "that the findings of this Committee shall not be binding upon the Medical Society of the State of New York until ratified by the House of Delegates"

The Secretary Amend by adding "or a two-thirds vote of the Council sitting ad interim"

Dr Kopetzky Dr Rooney's suggestion has been in-corporated into the paragraph and it now reads "No findings of this Committee shall be binding upon

the Medical Society of the State of New York until ratified by the House of Delegates, or by a two-thirds vote of the Council sitting ad interim"

I move its adoption Seconded and carried

Sec. 7 Committee on Arrangements No change. I move its adoption. Seconded and carried

(New Section) Sec. 8

The Committee on Medical Research shall consist of ten members, including the Chairman It shall adopt such measures as may be necessary to instruct the public and the profession in the desirability of animal experimentation and shall use all means to oppose such bills as may be presented to the Legislature with the view of limiting or restricting scientific progress. In legislative work it shall act in cooperation with the Committee on Legislation"

I move its adoption

The Secretary I move to amend this Section by adding, "It shall also conduct all matters of medical research referred to it by the House of Delegates or the Council"

Section as amended seconded and carried

Chapter X Special Committees Committee on Medical Research has been made a Standing Commit-

tee, Section 8 of Chapter 10
Chapter XIV Component County Societies first paragraph the following words "Nor shall any component county society accept a physician residing in another county in any other way than in accordance with the law governing transfers"

I move its adoption Seconded and carried

Chapter XV Miscellaneous Sec. 2 Strike out the word "New York" from the name of the Journal and change it to "Official Organ"

I move its adoption

Dr Bedell I have a complete file of the Journals which I would very much dislike to have broken I therefore move that the amendment suggested by the Committee be not adopted

The Chair is in doubt A rising vote called The amendment is lost

Dr Mabbott, New York Moved that Chapter XV, Sec. 2, be adopted as printed Seconded and carried.

Dr Kopetsky I move the adoption, as a whole, of the amended Constitution and By-Laws Seconded and carried

3 RELATION TO VOLUNTARY PUBLIC HEALTH AGENCIES The Secretary introduced the following resolution That the following general principles be Resolved

adopted by the House of Delegates as a basis for the conjoint work of the medical profession and voluntary public health agencies in the carrying on of public health work

I The essential part of public health work being preventive medicine, there should be no failure on the part of official and unofficial health and welfare organizations to recognize the importance of the local practicing physician.

2 All those associated in the conduct of public health activities must recognize fully that preventive medicine is the doctor's rightful field and that laymen must at

all times look to the medical man for guidance and leadership therein

3 Public health work within a county involves three participating factors, lay organizations, official governmental agencies, and the members of the county medical profession.

4 The evolution of a county health program should be the evolution of medical forces within the county It is not only the duty but the prerogative of the local physicians to assume leadership in the organization

physicians to assume leadership in the organization 5. The function of lay organizations and employees of the county health organizations, acting under the leadership of the practising physicians of the county, includes assistance in educational work, in helping those who are unable to carry out the doctor's advice, and in providing means whereby the public health program

may be carried out.

6 Lay organizations are needed in the county Their cooperation is to be welcomed by the physicians They are needed for the great educational work they can do, for their influence on public opinion, legislation and laws, and in many other ways

But preventive medicine must be controlled and guided by the medical men of

the county

7 As the function of the county health officer is not to exercise the function of the physicians of the county but to explain the facilities and stimulate the use of these facilities by the citizens therefore, before any innovations are put into effect by a demonstration or other agency, they should first be thoroughly studied and discussed by the medical society and the professional membership of the county board of health

8 All local publicity should be of fact and simply to inform the people of the county of public health work which is being done, why it is being done, and why it

should be done.

I move it be referred to Reference Committee on New Business (See Sec. 13)

4 CATTARAUGUS COUNTY RESOLUTION

Dr Garen, Cattaraugus, asked the privilege of introducing the following resolution and moved that it be referred to Reference Committee on New Business A

WHEREAS There has been continued in Cattaraugus County, a health demonstration, this continuance being without formal consultation on the part of the Demonstration officials, with the organized local profession,

Whereas The operating agency in this Demonstration is the State Charities Aid Association, and

WHEREAS The State Charities Aid Association has in conference with representatives of the State Medical Society pledged itself to conduct and guide the public health work which it is at present doing, in cooperation with the following consultation with the Medical Society of the County in which the work is being carried on, and

Whereas, Cattaraugus County Medical Society has declared its opposition to the continuance of the Cattaraugus County demonstration, as at present conducted

Therefore Be It Resolved, That the House of Delegates of the Medical Society of the State of New York sustains the protest of the Cattaraugus County Medical Society in its opposition to the Milbank Health Demonstration as at present conducted by the State Charities Aid Association, because it has not been governed by

the principles laid down by this Society governing the conduct of its members in relation to Public Health Work conducted by others than the recognized Medical profession (See Secs 31 and 34)

The Speaker declared a recess until 7 30 P M

EVENING SESSION, MONDAY, MAY 21, 1928
The meeting was called to order by the Vice-Speaker at 8.25 P M

5 RECORDS OF COUNTY SOCIETY MEMBERSHIP

Dr Hambrook, Rensselaer, presented the following resolution

Resolved, That each County Medical Society in the State be furnished by the State Medical Society a supply of cards to keep individual records of its membership Also, furnish a suitable fireproof container to keep such records

Referred to Committee on New Business B (See Sec. 32.)

6 Nurses' Identification

Dr Chalmers, Queens, presented the following resolution

WHEREAS, The attention of the Comitia Minora of Queens County that the Association of Registered Nurses of Greater New York and Long Island has construed the amendment to the General Business Law in relation to the licensing of employment agencies, which amendment became a law on March 29, 1927, as meaning that any physician who sends out any person to render nursing service shall give to each applicant and also send to the employer of such person within twenty-four hours of the time of employment a card stating the salary and qualifications of such applicant, as well as the name and place of the hospital and the length of time of service therein, or other experience in nursing, if not in a hospital whether such person is a graduate, trained, certified, registered, undergraduate or practical nurse or trained attendant, and if a graduate, trained, certified or registered nurse or trained attendant, that there shall also be stated on such card, the number of the annual registration certificates, issued to such nurse, or trained attendant by the Regents of the State of New York for the current year, and that a copy of such card shall be left on file for reference in the doctor's office, in other words, that a physician must be construed as falling within the statutory definition of the term "nurses' registry," and

WHEREAS, If such interpretation be correct, the statute as so interpreted would impose an unnecessary and harassing burden on every practising physician, there-

Be It Resolved, That the opinion of the legal counsel be requested with respect to whether the foregoing interpretation is correct and that if in his opinion such interpretation is correct, then and in such case the Legislative Committee of the State Society is hereby authorized and directed to take such steps as may be necessary, needful and proper to bring about an amendment to the said law to the end that such onerous restriction requirement be removed.

Referred to Reference Committee on the Report of the Committee on Nursing (See Sec. 36)

7 REFERENCE COMMITTEE ON PRESIDENT'S REPORT, COMMITTEE AND DIRECTORY

Dr Hicks Reference Committee on President's Report (Journal, May 1, page 481) We approve the President's recommendation to the effect that there should be a very close relationship between the Executive Committee and the Board of Trustees for the harmonious carrying forward of the policies of the Society as voiced by the House of Delegates

To cement a closer fellowship with the New Jersey and Connecticut State Societies, particularly with reference to the greater usefulness of the Directory and

its status as an official publication of the Society, thereby reducing the expense to our Society, we recommend the appointment of a Committee for the purpose

We recommend that the President be privileged to designate one of the other officers of the Society to represent the State Society at any meeting of a component society, and that his expenses for the same shall be paid by the State Society

Assistance for Committee on Public Health AND MEDICAL EDUCATION

WHEREAS, The important and successful work of the Committee on Public Health and Medical Education places a greater burden upon the Chairman and members than should be borne by volunteer service, and

Whereas, it is clear that this work will and should grow in the future,

We Recommend, That a full time Assistant to the Committee on Public Health and Medical Education be employed and that the Budget Committee present a budget therefor to the Board of Trustees

I move the adoption of the report.

Dr Bedell I move to amend the report by substi-

tuting the word "stenographer" for "assistant,"

Dr Hicks I accept the amendment and move the adoption of the report as amended

Seconded and carried

COMMITTEE ON RURAL HOSPITALS

The following preamble and resolutions were intro-

WHEREAS, It is reported there are four counties of the State in which there are no hospitals and that there are six counties where the hospital facilities appear to be madequate and Whereas, The practice of medicine under these con-

ditions is seriously handicapped,

We Recommend, That a Committee be appointed to assay the situation, to give aid and counsel to the communities affected and to report to the Society at its next annual meeting

I move the adoption of the report Seconded and car-

ried

10 New York Academy of Medicine

WHEREAS, The New York Academy of Medicine has accorded to the State Society the use of all of its facilities including the Library and the Bureau of Clinical Information, thus making it possible for visitors from the State to take full advantage of the clinical resources of the city, and has moreover given office rooms to the Society at a nominal rental

We Recommend that the House of Delegates declare on behalf of the State Society its warm appreciation of the fraternal and professional aid given its members by

the New York Academy of Medicine

Moved, seconded, carried that it be adopted

REFERENCE COMMITTEES ON REPORTS OF THE SECRETARY, THE COUNCIL, AND THE CENSORS

The Reference Committee on the Dr Borzilleri Reports of the Secretary, Council and Censors (Journal, May 1, pages 489, 494, and 497), approves of the general spirit of the report of the Secretary and its first six recommendations, and recommends them to the House of Delegates for approval

12 DATE OF PUBLICATION OF ANNUAL REPORTS

Your Committee suggests that in the By-Laws Chapter X, Section 10, the words "immediately after" be deleted and "one month before" be substituted in their This permits the Reference Committee to digest the reports they are to consider and act upon them more intelligently I move its adoption Seconded and carried We approve the recommendation regarding the general principles I move its adoption

The Secretary In order that these should come be-

fore the House and be adopted, the Conference Com mittee placed them in the hands of the Secretary, and he transmitted them by your order to the Reference Committee, and also the eight general principles were agreed upon with one or two little changes made necessary by the laws of the State of New York. The changes were made in No 4, which is corrected by the omission of the word "management," and now reads "The evolution of a county health program should be the evolution of medical forces within the county. It is not only the duty but the prerogative of the local physician to assume leadership in the organization" (See Sec.

3)
The Speaker requested the Chairman to state his rec-

RELATION TO VOLUNTARY HEALTH AGENCIES

Dr Borzilleri In regard to the summary offered as a report on the situation studied in Cattaraugus County, we recommend that the statements expressed in the eight general principles of the report of the Council be

adopted as the Public Health principles of the Council be adopted as the Public Health principles of the Medical Society of the State of New York. (See Sec. 3)

Dr Heyd Is it the purpose of the Committee to accept these general principles with the amendment made in No 4, leaving out the word "management" which is in conflict with the State law?

The Secretary It is

Motion moved, seconded and carried

14 CENSORS' REPORT

Your Reference Committee approves of the Report of the Board of Censors (Journal, May 1, page 497) in its entirety and recommends it to the House of Delegates for its approval

I move the adoption of the Report. Seconded and

carried

Moved that the report of the Committee as a whole, be adopted Seconded and carried

15 TREASURER'S AND TRUSTEES' REPORTS

Dr Myers Your Reference Committee on the Reports of the Treasurer (Journal, May 1, page 492 and Trustees (Journal, May 1, page 497) has carefully read the published reports and we commend the Treasurer for the care exercised in safeguarding our funds as well as his very complete report

We also desire to call your attention to the watchful supervision of our finances by the Board of Trustees and strongly to commend their endeavor to establish a substantial permanent investment fund as evidenced by the increase in two-and-a-half years of our invested funds from \$10,000 to over \$55,000

The State of Pennsylvania has a fund of \$178,000 and they are out for \$2,000,000 which they expect to get. The State of Michigan has also undertaken the establishment of a large fund which is to be used, as I understand it, for the endowment of medical education in the State I move the adoption of the report.

Seconded and carried.

Seconded and carried

16 COMMITTEE ON LEGISLATION

Your Reference Committee on the Report of the Committee on Legislation (Journal, May 1, page 498) desires to commend the Committee's activities and success in opposing inimical legislation. While there are success in opposing inimical legislation. While there are no recommendations in the report, your Reference Committee believes that the present method of dealing with legislative questions should continue in the same way pending a possible study of the relation of expenditure to the legislative problems now and in the future move the adoption of the report

COMMITTEE ON SCIENTIFIC WORK

Dr Ludlum Your Reference Committee on the Reports of the Committee on Scientific Work and the

Committee on Arrangements recommends that as the Committee on Scientific Work has made no recommendations the report be accepted as printed (Journal, May 1, page 499) I move the adoption of the Report Seconded and carried

18 COMMITTEE ON ARRANGEMENTS

Before proposing action on the recommendations of the Committee on Arrangements (Journal, May 1, page 500), we would call attention to the facts that not only have they done their own arranging well and fully, but they have also given much consideration to the matter, with reference to the work of future committees. We would direct your attention carefully to their report and would express our appreciation of their deliberations.

With reference to their recommendations that the Society purchase streopticons and moving picture machines and the Society's utilization of them, and the purchase of cloth blackboards, this Committee would recommend that the idea be approved and that this portion of the report be called to the attention of the Board of Trustees, with the approval of the House of Delegates

We recommend that the supplementary report of twelve or fifteen pages just received, be accepted as printed, as it contains no recommendations

I move the adoption of the report Seconded and

carried

معر ت سر ے

Their recommendation "that some manner of leewing be given to the Chairman of the Committee on Arrangements to enter into certain contracts, mostly of minor import' we approve, but would recommend that the detail of this should be taken up with the Board of Trustees who would undoubtedly arrange some plan by which such leeway would be given

Moved that the recommendation be referred to the

Board of Trustees

The Secretary stated that he thought this should be referred to the Council, since the Board of Trustees could not initiate, they could merely approve or disapprove of matters referred to them by the Executive Committee or the Council Matters relating to expenditures should be referred to the Council with power to recommend

Amendment accepted and word "Council" substituted for "Board of Trustees"

Motion as amended seconded and carried

19 APPOINTMENT OF A SPECIAL COMMITTEE TO STUDY THE MANAGEMENT OF THE ANNUAL MEETING

Their final recommendation "that a committee be appointed from the House at this meeting to study the question of the annual meeting in all of its phases, and to draw up certain general rules for guidance relative to the conduct of coming annual meetings". This Reference Committee would make this recommendation to the House, that this Report of the Committee on Arrangements and the much more extensive report which has just been handed to the Reference Committee, be put in the hands of the Special Committee for consideration and report to the Society through the Council

Motion made, seconded and carried Moved that the report as a whole be adopted Seconded and carried

20 COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

Dr Kosmak Your Reference Committee on the Report of the Committee on Public Health and Medical Education (Journal, May 1, page 502) desires to preface its report with an expression of appreciation of the eminently satisfactors and painstaking presentation of the activities of this Important Committee of the State Medical Society for the current year It reflects above all, a responsibility which our organization feels, in keeping up the scientific standards and interests in new

developments of the profession of this State and is in line with the thought that the science and art of medicine are constantly advancing and that it should be the um of every member no matter how isolated geographically, to keep abreast of such advancement by actual contact with carefully selected teachers. But, as the committee well states, no attempt should be made on the part of the State Society to enter the field of extensive and highly specialized post graduate study.

Taking up the report under consideration somewhat

Taking up the report under consideration somewhat more in detail, attention may be directed to the following matters referred to by Dr Farmer and his Com-

mittee.

20 PROGRAMS OF COURSES

The program of lecture courses outlined for the current year is very inclusive and the proposal to have the county societies select the topics for such lectures is to be commended. In this connection, the thought arises whether it might not be feasible to combine the program of certain regular meetings of county societies where the attendance is necessarily limited, with these lecture courses for the benefit of all concerned.

21 AFFILIATIONS WITH OTHER HEALTH ORGANIZATIONS

Affiliations between the State Department of Health and other organizations and the committee's lecture schemes are commended and should be carried out whenever and wherever possible, so as to avoid duplication of effort. The possible lack of financial support by the State Department of Health in carrying out the provisions of the Federal Shepard-Towner Maternity and Infant Welfare Act, may be an unmixed blessing in transferring this important work into less centralized and more local community effort, where essentially it belongs

22 FINANCES OF COURSES OF INSTRUCTION

The financial burden imposed on the State Society's treasury by this scheme of post-graduate instruction must be carefully considered, because of the constantly mounting costs. A possible appropriation of \$10,000 as suggested in the Committee's report would constitute almost 10% of the Society's income from membership dues of which the larger proportion is necessarily borne by the more populous counties, which in several instances have already sponsored lecture courses. Your Reference Committee would therefore express itself in a word of caution to the Board of Trustees in the solution of this important question.

The Committee's suggestion as to the manner of raising funds for graduate education should be carefully considered. Charging a registration fee has little to commend it under present circumstances. Accepting funds from private sources for the purpose would seem to defeat the fundamental relations of the State Society to its constituent membership, even under the conditions stated in the Committee's report and would possibly lead to undesirable administrative and other difficulties. We are more agreeable to the third recommendation of the Committee that County Societies themselves with aid extended when necessary by the State Society should shoulder the cost or responsibility in this instruction. In certain cases, however, where special instruction is proposed by organizations devoted to a particular activity, a liaison may be established under proper restrictions by your State Committee and under its complete administrative and scientific control.

its complete administrative and scientific control
Your Reference Committee therefore commends such
affiliations as have been made with the National Tuberculosis Association, the State Department of Health,

and similar bodies

It is evident that the work imposed by the Chairman of this important Committee is becoming more onerous every year and that some scheme should be worked out by which the desired end can be attained without such personal sacrifices on the part of the Chairman

RELATION TO THE NEW YORK STATE JOURNAL OF MEDICINE

Commenting on the pleas of the Committee that it be kept fully informed of the activities of the individual county societies, in public health matters, we would suggest the establishment of closer relations between this Committee and the State Journal and executive officers of the Society, both of which in the course of their activities must become aware of what is being done throughout the State along these lines

In conclusion your Reference Committee wishes to congratulate the Society upon the efficient labors done by this Committee, in this as well as in previous years and desires to call particular attention to the self-sacrificing and faithful work of its Chairman, Dr Farmer, to whom are due the thanks and appreciation of this body

I move the adoption of the report. Seconded and carried

24 COMMITTEE OF MEDICAL ECONOMICS

Dannreuther Your Reference Committee on the Report of the Committee on Medical Economics (Journal, May 1, page 506) notes with approval the activities of the Compensation Conference and the evidence of an increasing consideration for the rights of the injured and the medical profession

Your Reference Committee feels that it would be unwise for the Council to appoint a committee of eight to be composed of one physician from each District Branch to study more intimately the problems of the Work-men's Compensation Law, and the necessity for the creation of a Medical Advisory Committee, since the Committee on Medical Economics is already empowered to

carry on this work.
We commend the Committee's suggestion concerning the further popularization of periodic Health examinations

I move the adoption of the report Seconded and carried

COMMITTEE ON HEART DISEASE

Dr Bartley Your Reference Committee on the Reports of the Committees on Heart Disease (Journal May 1, page 507) and Medical Research, recommends that the Report of the Committee on Heart Disease be approved as presented with the recommendation that this Committee be continued for at least another year, with commendation for their work.

The Committee also endorses all the recommenda-tions of the Committee on Heart Disease.

COMMITTEE ON MEDICAL RESEARCH

We recommend that the Report of the Committee on Medical Research (Journal, May 1, page 510) be approved as presented, and the Committee commended for their work during the year
I move the adoption of the Report. Seconded and

carried

COMMITTEE ON PUBLIC RELATIONS

Dr Betts Your Reference Committee on the Reports of the Committees on Public Relations and of Councillors has carefully considered the report of the Committee on Public Relations (Journal, May 1, page 511) and commends and congratulates this Committee upon its work, and recommend its adoption as printed.

COUNCILLORS' REPORTS

It has also reviewed the reports of the Councillors of the various District Branches (Journal, May 1, page 522) and notes with pleasure that there has been an increase in the attendance at the various meetings and recommends that the officers of the District Branch Societies establish a much closer contact with, and secure greater cooperation of, the constituent county societies
I move the adoption of the Report Seconded and

carried

29 Counsel's Report

Your Reference Committee on the Dr Douglas Report of Counsel (Journal, April 1, page 391) com mends the careful report made by the Counsel of the They believe that he and his able staff of assistants have given the utmost care to the defense and study of all suits brought against members of this Society, and the best advice possible in the settlement of litigation

The Committee approve of the editorials and reports of cases appearing in the State Journal, prepared in the office of the Counsel as being of interest and value to members of the Society They appreciate the great value of the legal advice given to the Executive Committee, Council and individual members of the Society as well as to its Legislative Committee in the study and preparation of bills

The Committee concurs with the suggestion of Coun sel that the Society express its thanks for the personal interest shown by the authorized indemnity representatives of the Society, Mr Harry F Wanvig, in aiding to make possible the success of the Group Insurance

The Counsel has made no recommendations and the Committee has none to suggest.

I move the adoption of the Report. Seconded and carried

30 COMMITTEE ON DIPHTHERIA IMMUNIZATION

Dr Colie Your Reference Committee on the Report of the Committee on Immunization of children against Diphtheria (Journal, May 15, page 604) has studied the report as prepared by the Committee, concurs in the findings, and recommends its adoption, with thanks to the Committee.

Your Committee notes that particular stress is laid upon the necessity of securing immunization in the pre-school age. To help meet this need your Committee recommends that this House of Delegates take such action as will lead to the sending with each copy of a birth certificate forwarded to a parent, a card or printed slip advising the necessity for vaccination and the appropriate date therefor, as well as similar information relative to toxin-anti-toxin administration, with appropriate date. That where the parents are of foreign birth, such information be also printed in the language of the mother's native land, as indicated upon the origmal birth certificate filed with the Bureau of Vital Sta-tistics, or in the case of certain municipalities, with the City Department of health

I move the adoption of the report. Seconded and

carried

CATTARAUGUS COUNTY RESOLUTION

Dr Garen requested permission to withdraw the resolution introduced from Cattaraugus County Society just before adjournment of the afternoon session (Sections

4 and 34) and substitute the following Whereas, There has been continued in Cattaraugus County a health demonstration, this continuance being without formal consultation on the part of the Demonstration officials with the organized local profession,

Whereas, The operating agency in this Demonstration is the State Charities Aid Association, and

WHEREAS, The State Charities Aid Association has in conference with representatives of the State Medical Society pledged itself to conduct and guide the public health work which it is at present doing, in cooperation with and following consultation with the Medical Society of the County in which the work is being carried

on, and
WHEREAS, Cattaraugus County Medical Society has declared its opposition to the continuance of the Cattaraugus County demonstration as at present conducted Therefore Be It Resolved, That the House of Delegates of the Medical Society of the State of New York sustains the protest of the Cattaraugus County Medical

Society in its opposition to the Milbank Health Demonstration as at present conducted by the State Charities Aid Association, because it has not been governed by the principles laid down by this Society governing the conduct of its members in relation to Public Health Work conducted by others than the recognized medical profession.

Referred to Reference Committee on New Business A

32 RECORDS OF COUNTY SOCIETY MEMBERSHIP

Your Reference Committee on New Business B, recommends the adoption of the motion introduced by Dr Hambrook that the State Medical Society furnish each county medical society a supply of cards to keep individual records of its membership

(Sec. 5)

The Committee feels, however, that although it is highly desirable that such reports be kept in fireproof or fire-resisting containers, it cannot be considered practicable nor the function of the State Society to furnish the first different rounties of the State. nish these to the sixty different counties of the State, Your Committee therefore disapproves the adoption of this recommendation

I move the adoption of the Report. Seconded and carried

SIGNS OF DECEASED PHYSICIANS

Dr Mabbott New York I would like to move that the House of Delegates request the Counsel of the Society to furnish the House with an opinion as to whether there is any legal restriction or limit to time in regard to the display of the signs of deceased physicians upon the outside of buildings or in the windows of buildings in which they formerly practised.

Counsel My opinion is that under the statutes of this State, especially our Medical Practice Act, to practice medicine under a name other than the name of the person practicing is a crime. Therefore, any doctor who maintains in his office window the sign of a deceased doctor emplies that he is practicing under that name, and such a course is illegal

CATTARAUGUS COUNTY RESOLUTION

Dr Townsend Your Reference Committee on New Business A has the honor to submit a unanimous re-

of the County of Cattaraugus (Section 4 and 31) regarding the Health Demonstration in that County

Dr Cottis, Chautauqua I move to amend by the substitution of the word "if" for the word "because," making it read that we endorse this act of the Medical Society of the County of Cattaraugus if the Milhagi. Society of the County of Cattaraugus if the Milbank Fund is not living up to our principles

Dr Heyd New York I submit a substitute resolu-

tion as follows

RESOLVED, that the House of Delegates of the Medical Society of the State of New York sustain and endorse the protest of the Cattaraugus County Medical Society in its opposition to the Milbank Health Demonstration as at present conducted by the State Charities Aid Association because it (the Milbank Foundation) has not governed itself either in spirit or practice by the principles laid down by this Society for the conduct of the months of the months of the conduct of the condu its members in their relation to public health work conducted by lay organizations

The eight points are covered in this, it sustains the attitude of the District Societies of this Society opens the road for tolerant men of the foundation and for a more equitable temper in the County of Cattaraugus to settle this thing right for the benefit of the com-

munity and all concerned

Dr Garen I accept the substitute resolution Motion moved seconded and carried

SOCIETY FOR THE CONTROL OF CANCER

The Secretary Mr Speaker and Gentlemen I have a letter to Dr Sadlier from the American Society for the Control of Cancer in New York State and Dr Sadlier submitted it to the Executive Committee who ordered it placed before the House of Delegates

"My dear Dr Sadlier

"You will recall that during our conversation at your house on the evening of March 5th that I made reference to the plan that the New York State Committee of the American Society for the Control of Cancer is developing for the accumulation of an endowment fund of \$300,000 to carry out the work of the Committee in the State.
"When the appeal is made those who are asked to

contribute will be informed that in case in the future a cure for cancer is discovered, the funds contributed to the endowment will be returned to the counties in which they were collected for the purpose of carrying out the details of the cure for cancer in that locality, under the direction of the County Medical

Society
"The Sub-Committee feels that it would be an advantage if the Medical Society of the State of New York was informed of our plans and would pass some kind of resolution specifically endorsing it. We, of course, remember that the Medical Society of the State of New York endorsed the program of the American Society for the Control of Cancer and the program of the New York State Committee of the American ican Society for the Control of Cancer at previous meetings

"We have, however, now, a definite plan for the raising of money and feel that a definite endorsement of this plan will be helpful when the appeal is made.

> "Yours truly, "John M Swan, "Chairman"

Moved that the letter be laid on the table Seconded and carried

36 COMMITTEE ON NURSING

Dr Jewelt Your Reference Committee on the Reports of the Committees on Nursing and Nursing Education and to study the Curriculum for Nursing Education in New York State, (JOURNAL May 15 page 600) after careful consideration of the recommendations of these Committees, is pleased to report as follows

The establishment of official registries which shall be endorsed by the County Medical Societies and conform to the requirements of the registry law

While the House of Delegates has already gone on record as indorsing the principle of official registries, believing that this should be again emphasized, we approve and recommend its adoption

2 The stimulation of the co-ordination of all nurs-

ing service in each County

We believe that coordination of nursing activities is highly desirable, and recommend the adoption of this

suggeston
3 The encouragement of hourly, part-time or group nursing

The Committee, feeling that this type of nursing service meets a community need, recommends its adoption

Extension of visiting nursing service

We believe that economic conditions require some form of district nursing and recommend the adoption of the above recommendation

Recommendations 5, 6, 7 and 8 mivolve matters still under consideration by the Committee appointed to study the curriculum for nursing education in the State of

New York
We therefore recommend that these matters be re-

ferred to this latter committee

The Reference Committee recommends that the Committee to Study the Curriculum for Nursing Education in the State of New York be continued for another year

I move the adoption of the Report Seconded and

The Committee further recommends that the resolution offered by Dr Chalmers of Queens, relating to the interpretation of the law dealing with nurse registries be referred to the Legal Counsel for his consideration and action

I move that the Report as a whole be adopted Sec-

onded and carried

MEDICAL ADVISORY BOARD

Dr Dyer, Broome Offered a resolution that a special Committee be appointed to devise a method whereby the names of physicians of the Medical Society of the State of New York may be furnished the Governor of New York State from which to choose members of the State Medical Advisory Board when a Labor Compensation Bill may pass

Referred to Reference Committee on New Business

B (See Sec. 42)

Dr Bedell, Albany I move to adjourn until 9 30 Tuesday morning

Seconded and carried The first order of business

to be the Election of Officers

Adjourned Session of the House of Delegates Tuesday, May 22, 1928

The meeting was called to order by the Speaker at 10 15 A M

38 ROIL CALL

The Speaker The Secretary will please call the roll The Secretary called the roll and the following dele-

gates responded

Shaw, Thomas P Farmer, Samuel J Kopetzky, W Warren Britt, Arthur W Booth, Nathan B Van Etten, Grant C. Madill, Wilsiam H Ross, James F Rooney ham H Ross, James F Rooney

The following Ex-Presidents and Ex-Secretary were

present

Wendell C. Phillips, Martin B Tinker, Grant C. Madill, J Richard Kevin, James F Rooney, Arthur W Booth, Orrin Sage, Wightman, Nathan B Van Etten, George M Fisher, Edward Livingston Hunt.

39 Tellers of Election

The Secretary The Speaker has appointed the fol lowing Tellers

Milton A Bridges, New York, Chairman, Edwin A Griffin, Kings, Howard Myers, New York, Francis Riley, Queens, Eugene Hinman, Albany, Harry Aranov, Bronx, Harrison Betts, Westchester, William Krieger, Dutchess-Putnam, Frank Dyer, Broome. William A

The Secretary I move that the nominating speeches

be limited to two minutes

Seconded and carried.

40 RETIRED MEMBERS

I move that the following be elected The Secretary

Retired Members

Ketired Members
E. Eliot Harris, New York, George W Bates, Schenectady, Stephen Burt, New York, Charles M Culver, Albany, Ralph D Eastman, Tioga, William C Gilley, New York, J Riddle Goffe, New York, Robert Hebenstreit, Erie, Marcus Markiewicz, New York, Robert J Morrison, Kings, I Wheeler Smith, Kings, Lyman E. Rockwell, Dutchess-Putnam, Grace Kimball, Dutchess-Putnam, Robert G Eccles, Kings, James H Glass, Oneida, James W Douglass, Oneida, Gilbert N Lehr, Oneida, Arthur L Holden, Oneida, Eliza Mosher, Kings

Seconded and carried

41 DR E ELIOT HARRIS, SPEAKER EMERITUS

The Secretary I move that Dr E. Eliot Harris be given the honorary title of Speaker Emeritus Seconded and unanimously carried

The Secretary I move that in placing Dr E Eliot Harris upon the retired list, this House of Delegates instruct the Executive Committee, Council, Trustees, and every other body to afford him all the courtes) that they would were he an active member except, of course, the right to vote and to hold office, principally, that he receive without expense his Journal and his Directory

Seconded and carried unanimously

MEDICAL ADVISORY BOARD

Reference Committee on New Business B A Resolution has been offered that a special commit tee be appointed to devise a method whereby the names of physicians of the Medical Society of New York State may be furnished the Governor of New York State from which to choose members of the State Medical Advisory. Advisory Board when a Labor Compensation Bill may pass (See Sec. 37)

Your Committee sees in the purpose of this Resolution, an attempt to anticipate the passage at the next session of the Legislature of the State Compensation session of the Espaining of the Bill, and to devise the machinery by which members of the Medical Advisory Board may be suggested to the Governor This Committee would be given the power to devise a method and it is presumed that this method would be carried out. The period to be covered will only be that between the closing of the Legislature and the meeting of this House next May

Your Reference Committee feels that the present machinery of the Society had better cope with this

situation than a Committee.

Your Committee is entirely in sympathy, however, with the apparent intent of the Resolution that the House of Delegates give consideration and have the power to decide when such a bill is passed, the best means by which such members of the State Medical Advisory Board be submitted to the Governor

The motion is not approved
I move that the Report be adopted Seconded and carried

43 Invitations for Annual Meeting

Dr Borzilleri, Eric On behalf of the Medical Society of the County of Eric, I wish to extend to the State Medical Society an invitation to hold its Annual Meeting in Buffalo

Moved it be referred to the Council

Seconded and carried

Dr Fisher, Oncida Oneida County commends to the State Medical Society through the House of Delegates to the Council an invitation to hold the next Annual Meeting in Utica.

Moved that it be referred to the Council

Seconded and carried

Dr Hambrook, Rensselaer Rensselaer County takes pleasure in an invitation to the State Medical Society to hold their Annual Meeting in Troy

Moved that it be referred to the Council

Seconded and carried.

SPECIAL COMMITTEE ON MEMBERSHIP

Moved that a Special Committee shall be appointed to formulate some method of increasing the membership of the Medical Society of the State of New York, masmuch as none of the machinery that we have has proved the least bit effective in accomplishing this

Moved that it be referred to the Council

Seconded and carried

THANKS TO ALBANY COUNTY MEDICAL SOCIETY

Dr Fisher, Oncida Moved that the House of Delegates extend a vote of thanks and appreciation to Albany County for their splendid entertainment onded and unanimously carried

46 ELIGIBILITY TO OFFICE

The President of the Fourth District Branch having been nominated for Second Vice President the Secretary requested the Counsel to give an opinion as to the

legality of holding two offices at the same time

The Counsel This question is not settled by the By-Laws or the Constitution, but in the absence of a specific provision in either relating to this question, my opinion is that this House should be bound by ordinary parlimentary usage and the general custom of the Laws of the State of New York, and under that, in my judgment, no one should hold two offices at the same time.

Dr Stanzux, Westchester I move that the House

concur to the opinion of the Counsel

Seconded and carried

ELECTION OF OFFICERS

The Secretary It has been the custom for years to lay over the election of the Chairman of the Committee on Arrangements until the place of the next Annual Meeting has been decided

The following officers were nominated and declared

elected

elected
President-Elect, James N Vander Veer, 1st Vice-President, Thomas H Farrell, 2nd Vice-President, Edward W Weber, Speaker John A. Card, Vice-Speaker, Walter D Ludlum, Secretary, Daniel S Dougherty, Assistant Secretary, Peter Irving, Treasurer, Charles G Heyd, Assistant Treasurer, James Pedersen, Trustee, Arthur W Booth, Chairman Committee on Legislation, Henry L. NEWS NOTES

DISTRICT BRANCH CONFERENCES

Following the precedent of last year, a series of conferences of the officers of the District Branches of the Medical Society of the State of New York have been begun for the purpose of planning the programs of the annual meetings to be held in the fall The choice of places and dates for holding the meetings depends largely on the convenience of the officers of the State to attend them, for the meetings afford the principal opportunity that the State officers have to come into close contact with the medical leaders in their own districts and counties

The preliminary conferences last year were described on page 735 of the July 1, 1927 issue of this Journal

Editorial comments and suggestions embodying the best features of a composite program of the District Branch meetings based on past experiences, was printed on page 1314 of the December first issue of this Journal

Four conferences have already been held this year, and are described in the articles which immediately follow this introduction

FIRST DISTRICT BRANCH

Dr Cunniffe, President of the Branch, invited the officers and Presidents of the component County Societies to dine with him at the Cornell Club New York City, on Friday, June 8, 1928 There were present, in addition to Dr Cunniffe and the Executive Officer Dr Kline, Nyack, 2nd Vice-President, Dr Douglas, President of the New York County Society, Dr Gitlow, President of the Bronx County Society, Dr Littell, President of the Westchester County Society, and Dr Little, President of the Rockland County Society

It was decided to hold the next annual meeting

of the District on Thursday, October 18th, at Briarcliff Manor The program, as tentatively outlined, shall contain a paper on the serum treatment of pneumonia, another on some surgical subject, and some one of the very instructive medical moving pictures which are just now receiving much attention and discussion

Several other matters relating particularly to the medical situation in this District—as, for instance, fee splitting, open hospitals, and health of the school child—were discussed very earnestly before adjournment

THIRD DISTRICT BRANCH

At the invitation of Dr Edgar Vander Veer, President of the Third District Branch, a meeting of the officers of the Branch and the Presidents of the component County Societies was held in Albany on Wednesday, June 20th There were present, in addition to Dr Vander Veer and the executive officer Dr H L Odell, First Vice-President, Dr W M Rapp, Secretary, Dr E Billings, Treasurer, Dr L W Gorham, President of the Albany County Society, and Dr M Bruce, President of the Schoharie County Society It was decided to hold the next annual meet-

ing in Hudson on Thursday, October 11th The program, as tentatively outlined, will consist of dry clinics and scientific papers on the following subjects Arthritis, Undulant Fever, Maternal Mortality, Gall Bladder, and some educational film

The executive officer reviewed some of the important conditions existing in the State at the present time which have a relation to the practice of medicine. They were the same subjects that he discussed before the other executive committees.

FOURTH DISTRICT BRANCH

A meeting of the Executive Committee and Presidents of the component County Societies of the Fourth District Branch, which was held at Dr Barton's invitation on Wednesday, May 30th, at Deershead Inn, Elizabethtown There were

present of the officers of the District Dr Barton, President, Dr W L Munson, 1st Vice-President, Dr Carl Comstock, Secretary, and Dr Sydney Blanchet, Treasurer And the following County Society Presidents Dr E S McDowell,

of Clinton County, Dr J H Evans, of Essex County, Dr T A Lewis, of St. Lawrence County, Dr T J Goodfellow, of Saratoga County, and Dr J S Lawrence, executive officer

Several invitations were considered for holding the next annual meeting, and by unanimous vote the invitation from St Lawrence County was accepted Dr Lewis, in presenting his invitation, called attention to the fact that it has been fifteen years since the District Branch last met in that section of the state Following the custom which this Branch has found so satisfactory, the meeting will extend from noon of one day until noon of the next. The dates selected are Friday, September 21st and Saturday, September 22nd The end of the week was chosen so as to afford those who drive long distances an opportunity to spend the week-end on the St Lawrence if they wish Much enthusiasm was expressed over the success of last year's program and, accordingly, the tentative ideas for this year's program are along the same line. On Friday afternoon it is proposed that clinics in medicine, surgery and X-ray be conducted at the Hepburn Hospital, and on Saturday morning mental clinics at the State Hospital. On Friday evening there will very likely be a dinner, when greetings from visiting officers of the State Society will be presented.

At Dr Britt's suggestion that three physicians be named from this District to serve as a sub-committee to the standing committee on Medical Economics, the following men were selected Dr Charles G McMullen, of Schenectady, Dr Earl King, of Saratoga, and Dr Horace M Hicks, of Amsterdam

A number of local affairs were discussed, among them the statistics on maternal mortality recently published by the State Department of Health

FIFTH DISTRICT BRANCH

At the invitation of Dr Page E Thornhill, President of the Fifth District Branch, a meeting of the officers of the Branch and the Presidents of the component County Societies was held in Watertown on Tuesday evening, June There were present, in addition to Dr Thornhill and the executive officer Dr A B Santry, First Vice-President, Dr C R. Bartlett, President of Oneida County Society, Dr J J Buettner, President of Onondaga County Society, and Dr Byron Haskin, President of Jefferson County Society Inclement weather, without doubt, interfered with the attendance. Watertown is not the center of the District, but is easily reached by automobile, and if the weather had been pleasant, no doubt many of the men would have driven up

It was decided to hold the next annual meeting of the Branch Society in either Rome ur Utica Nobody being present from Rome, final decision will not be made until Friday, June 22nd, when there will be a meeting of the Comitia Minora of the Oneida County Society The date selected was Tuesday, October 9th The program, as tentatively outlined, will contain papers on the following subjects Sinus Infections, Standards of Pre-Natal Care, Blood Transfusion, Skin Conditions, and some paper on medicine.

Following the discussion on the program, the

executive officer reviewed situations in the state with regard to the following subjects, and recommended that the Presidents of the County Societies make a point in studying some of them, during the winter, as they relate directly to their own communities the antidiphtheria work as generally conducted, and particularly the character it has taken in Schenectady, Batavia and Poughkeepsie, and the anti-diphtheria poster contest which has been conducted in the schools during the last three months, the high maternity mortality rate which prevails, the creation of school hygiene districts by the State Department of Education, with particular reference to the one in process of organization in Ontario County, the postgraduate lectures, and the proposed investigation by the National Committee on the Cost of Medical Care, with particular reference to the research undertaken by the committee at Binghamton, and also reference to the paper by Dr Pusey contained in the Jour-nal of the AMA for June 9th and an article by Irving Fisher, Professor of Economics at Yale University, which appeared in the Albany Knickerbocker Press of June 18th, entitled "Human Engineering Reduces Time Lost Through Illness-Periodical Physical Examinations Pay Dividends to Employers and Increase Earning Capacity of Employees"

SIXTH DISTRICT BRANCH

Dr LaRue Colegrove, President of the Sixth District Branch, invited the officers and presidents of the component County Societies to

dine with him at the City Club, Elmira, on Tuesday, June 12th There were present, in addition to Dr Colegrove and the executive offi-

cer Dr G M Cady, 1st Vice-President, Dr S B Blakely, 2nd Vice-President, Dr H B Marvin, Secretary, Dr W A Moulton, Treasurer, and the following County Society Presidents Dr F J Atwell, Otsego County, Dr A C Durand, Tompkins County, Dr L S Betowski, Tioga County, Dr S D Molyneaux, Broome County, also Dr R B Howland, Elmira, and Dr W G Fish, Ithaca

It was decided to hold the next annual meeting of the District Branch on Tuesday, September 25th, at the Arnot-Ogden Hospital, Elmira The program, as tentatively outlined, shall contain a paper on expert testimony, one on fractures, one on appendicitis, one on urology, and one on maternal mortality. This paper will be prepared by Dr. Blakely and will treat not so much of obstetrical technique, as upon the conditions that attendipregnancy in these counties during the pre-natal stage, during labor and the post-partum period

Before adjourning, we discussed a number of

conditions in the District that have a bearing upon medical practice, and probably the most interesting of these subjects was the information that Tioga County, which now has no hospital facilities within its borders, is likely to have a hospital at Waverly in the near future A number of the physicians of New York State are closely affiliated with the Physicians' Hospital of Sayre, Pa It is proposed that this hospital be moved across the state line to Waverly This proposition has been enthusiastically accepted by the physicians of Waverly and vicinity, and it is expected that the transfer will be made very soon

The executive officer reviewed the important medical situations that are before the physicians of the state at the present time, among them were the anti-diphtheria program, the maternal mortality report as recently submitted by the Department of Health, school inspection, and the study undertaken by a lay agency

of the cost of medical care

SEVENTH DISTRICT BRANCH

Dr Austin G Morris, President of the Seventh District Branch, invited the officers and presidents of the component County Societies to dine with him at the Oak Hill Country Club, Rochester, on Wednesday evening, June 13th There were present, in addition to Dr Morris and the executive officer Dr Ralph Sheldon, First Vice-President, Dr John A Lichty, Secretary, Dr E T Wentworth, Treasurer, and the following County Society presidents Dr Cyril Sumner, of Monroe County, Dr R C Almy, Cayuga County, Dr C E Doubleday, Yates County, Dr T E Quigley, Ontario County, Dr G E Taylor, Steuben County, also Dr Floyd Winslow, Rochester, Dr L M Kysor, Hornell, and Dr Thos F Farmer, Chairman of the Committee on Public Health and Medical Education

It was decided to hold the next annual meeting of the District Branch on Thursday, September 27th, at the Oak Hill Country Club, Rochester The program, as tentatively outlined, shall contain papers upon the following subjects Clinical Pathology, Poliomyelitis, and three others varied between medicine and surgery Very likely there will be shown one or more of the scientific medi-

cal films which Mr Eastman has recently prepared

Following the regular business, the executive officer reviewed the important medical situations that are before the physicians of the state at the present time, applying them particularly to this Among them were the anti-diphtheria campaign, the maternal mortality report as recently submitted by the Department of Health, the study undertaken by a lay agency of the cost of medical care, and the school of hygiene district that has recently been created by the State Department of Education in Ontario County The board of supervisors of that county has appropriated \$6,000 00 for the expenses, during the coming year, of the conduct of such school hygiene district It is proposed to appoint a physician as full time director, who will have immediate jurisdiction over all the school medical inspection work in the county outside of the cities of Geneva and

Dr Farmer outlined the work in post-graduate education planned for this District for the next year

EIGHTH DISTRICT BRANCH

Dr Thomas J Walsh, President of the Eighth District Branch, invited the officers and presidents of the component County Societies to dine with him at the Alumni Club, Buffalo, on Thursday evening, June 14th There were present, in ad-

dition to Dr Walsh and the executive officer Dr W R Thomson, 1st Vrce-President, Dr W W Britt, Secretary, Dr R H Wilcox, Assistant Secretary, Dr F H VanOrsdale, Treasurer, and the following County Society Presidents Dr

L L Klostermyer, Wyoming County, Dr C A Lawler, Cattaraugus County, also Dr Trick, President of the State Society and Dr Farmer, Chairman of the Committee on Public Health and Medical Education

It was decided to hold the next annual meeting of the District Branch on Tuesday, October 2nd, at the City Hospital, Buffalo The program, as tentatively outlined, will consist of clinics in the morning in surgery, medicine, tuberculosis and, in fact, all activities of the hospital At noon there will be a buffet luncheon and in the afternoon scientific papers will be read by one or two invited guests and one or two local men The President, Vice-President and Secretary were appointed a committee to complete the final arrangements of the program

As at the other meetings, the executive officer reviewed the important medical situations that are before the physicians of the state at the present time, applying them particularly to this District. Among them were the anti-diphtheria program, the maternal mortality report as recently submitted by the Department of Health, school inspection, and the study undertaken by a lay agency of the cost of medical care

Dr Britt outlined the work that he contemplates to accomplish with his Committee during the coming year, and asked the appointment of three members of the District to serve as a subcommittee with him

Dr Farmer outlined the work that he has planned in post-graduate education for this District

THE BUFFALO CITY HOSPITAL AND THE MEDICAL PROFESSION

The Board of Managers of the Buffalo City Hospital has adopted a broad policy of sending to the family physician of every patient two statements regarding the patient,—one on the admission and another one on the discharge of the case The following open letters set forth the scope of the new plan

Buffalo, N Y, June 11, 1928

To the Medical Profession of Erie County, New York Enclosed with this is copy of a letter addressed to the chancellor of the University of Buffalo, under date of June 6, 1928, which is self-explanatory

The Board of Managers of the Buffalo City Hospital, trusts that you will find useful the plan described

Respectfully,
Walter S Goodale, M D,
Superintendent

Dr Samuel P Capen, Chancellor, University of Buffalo, Buffalo, New York My Dear Dr Capen

Begining Monday, May 28, 1928, there was inaugurated a plan, demonstrating once more that the Board of Managers, Buffalo City Hospital and the Council of the University of Buffalo are ever mindful of the interests of the medical profession, in order that the community may reap the benefit of the best practice and the modern discoveries in the medical sciences

On and after this date, whenever a new patient enters the wards of the Buffalo City Hospital, or applies for treatment in the Outpatient Department, either with or without the recommendation of a private physician, the last doctor employed by the applicant will be notified in writ-

ing Such letters of notification will state that private physicians are privileged to treat full pay patients in the wards of the Buffalo City Hospital, and that they may also visit part pay and free patients for purely scientific or personal reasons, provided no charge is made for this service

The financial rating given by the Buffalo City Hospital to the prospective patient also will be set forth and the private physician asked whether or not, in his opinion, the classification indicated is proper

These letters will also state that, immediately after the discharge of the patient, a summary of the medical findings of the attending and house staffs of the Buffalo City Hospital will be forwarded to the physician designated

Also, each notice will include a cordial bid, asking the physician to attend any of the diagnostic, treatment or operative clinics maintained by the Buffalo City Hospital, either with the patients referred or as an observer These clinic hours are fully described on the enclosed schedule

This communication to physicians will close with the statement that it is the aim of the Board of Managers, Buffalo City Hospital, and the Council of the University of Buffalo to make the former institution helpful to the medical and dental professions, and that the entire clinical and laboratory services of the hospital is at the disposal of physicians and dentists for this purpose.

Attention is also called to the fact that the Committee on Post Graduate Teaching, headed by James E King, MD, Chairman, and A H Aaron, MD, Secretary, representing the University of Buffalo, stands sponsor for the clinics listed on the enclosed schedule, and hopes thereby to improve post graduate teaching in Medicine and Dentistry to the end that the members of the

cer Dr G M Cady, 1st Vice-President, Dr S B Blakely, 2nd Vice-President, Dr H B Marvin, Secretary, Dr W A Moulton, Treasurer, and the following County Society Presidents Dr F J Atwell, Otsego County, Dr A C Durand, Tompkins County, Dr L S Betowski, Tioga County, Dr S D Molyneaux, Broome County, also Dr R. B Howland, Elmira, and Dr W G Fish, Ithaca

It was decided to hold the next annual meeting of the District Branch on Tuesday, September 25th, at the Arnot-Ogden Hospital, Elmira The program, as tentatively outlined, shall contain a paper on expert testimony, one on fractures, one on appendicitis, one on urology, and one on maternal mortality. This paper will be prepared by Dr. Blakely and will treat not so much of obstetrical technique, as upon the conditions that attendipregnancy in these counties during the pre-natal stage, during labor and the post-partum period

Before adjourning, we discussed a number of

conditions in the District that have a bearing upon medical practice, and probably the most interesting of these subjects was the information that Tioga County, which now has no hospital facilities within its borders, is likely to have a hospital at Waverly in the near future A number of the physicians of New York State are closely affiliated with the Physicians' Hospital of Sayre, Pa It is proposed that this hospital be moved across the state line to Waverly This proposition has been enthusiastically accepted by the physicians of Waverly and vicin ity, and it is expected that the transfer will be made very soon

The executive officer reviewed the important medical situations that are before the physicians of the state at the present time, among them were the anti-diphtheria program, the maternal mortality report as recently submitted by the Department of Health, school inspection, and the study undertaken by a lay agency

of the cost of medical care

SEVENTH DISTRICT BRANCH

Dr Austin G Morris, President of the Seventh District Branch, invited the officers and presidents of the component County Societies to dine with him at the Oak Hill Country Club, Rochester, on Wednesday evening, June 13th There were present, in addition to Dr Morris and the executive officer Dr Ralph Sheldon, First Vice-President, Dr John A Lichty, Secretary, Dr E T Wentworth, Treasurer, and the following County Society presidents Dr Cyril Sumner, of Monroe County, Dr R C Almy, Cayuga County, Dr C E Doubleday, Yates County, Dr T E Quigley, Ontario County, Dr G E Taylor, Steuben County, also Dr Floyd Winslow, Rochester, Dr L M Kysor, Hornell, and Dr Thos F Farmer, Chairman of the Committee on Public Health and Medical Education

It was decided to hold the next annual meeting of the District Branch on Thursday, September 27th, at the Oak Hill Country Club, Rochester The program, as tentatively outlined, shall contain papers upon the following subjects Clinical Pathology, Poliomyelitis, and three others varied between medicine and surgery Very likely there will be shown one or more of the scientific medi-

Dr Farmer outlined the work in post-graduate education planned for this District for the next year

EIGHTH DISTRICT BRANCH

Dr Thomas J Walsh, President of the Eighth District Branch, invited the officers and presidents of the component County Societies to dine with him at the Alumni Club, Buffalo, on Thursday evening, June 14th There were present, in ad-

dition to Dr Walsh and the executive officer Dr W R Thomson, 1st Vice-President, Dr W W Britt, Secretary, Dr R H Wilcox, Assistant Secretary, Dr F H VanOrsdale, Treasurer, and the following County Society Presidents Dr

"The last Bulletin contained the following statement

"'The whole proposition depends on the attitude taken by health officers. The dealers and others who know they need permits and who will comply with the requirements if they know they must, are waiting to observe the way "the straws point". If it is realized that the health officer means business, there will be action on the part of the people in the business. The public is also interested in the attitude of the health officer'

"Since writing that, we have addressed more meetings, and have met more milk dealers and producers, and we are more strongly convinced than before of the correctness of this statement

"The milk man who is kicking the most vigorously is the one whose dairy would not be accepted by a creamery shipping to New York, and who is selling locally at a better price than the man who is able to sell to a creamery

"Empty the waste basket, go through the stack on the desk and dig up the bulletins we have mentioned July 1 is close at hand"

DR HIDEYO NOGUCHI

The following resolution was passed by the Section on Dermatology and Syphilology at its meeting on May 23, 1928

RESOLVED, That in the sudden and tragic death of Dr Hideyo Noguchi, the medical profession has lost one of its ablest and most successful workers in scientific medicine

In view of his invaluable contributions to syphilis and other dermatological subjects the

Section on Dermatology and Syphilology of the Medical Society of the State of New York desires to express its profound admiration of his work and its great sorrow at the loss of so eminent a colleague

GEORGE M FISHER, JEROME KINGSBURY, WALTER J HIGHMAN, HOWARD FOX, Chairman

RENSSELAER COUNTY

The Rensselaer County Medical Society held its monthly meeting on May 8, 1928, at 7 o'clock in the evening

A dinner was enjoyed in the Crystal Ball Room of the Hendrick Hudson Hotel at which 181 Medical Men were present. After the dinner 83 more physicians who were unable to attend the dinner came for the scientific program Dr John J Rainey, President of the Rensselaer County Medical Society, presided

Dr J E Sadher, President of the State Society, gave a most interesting 10 minute talk in which he called "The Rensselaer County Medical Society the most energetic unit in the state."

Dr Frank H Lahey of Boston gave the ad-

dress of the evening His subject was "Gastric and Duodenal Ulcers" Dr Lahey spoke for one hour and forty-five minutes and held the attention of his audience every moment When the meeting was adjourned by President Rainy, the men were reluctant to leave and wanted more from Dr Lahey

The attendance of 264 physicians was the high water mark for medical meetings for this part of the state

There were 115 men present out of a membership of 130 from Rensselaer County, the balance being from a radius of 80 miles from Troy

D A. Calhoun, Secretary

WASHINGTON COUNTY

The semi-annual meeting of the Medical Society of the County of Washington was held at Granville, May 9, 1928, at 415 P M, with President Fortuine in the chair Present, Drs Fortuine, Bennett, Paris, Banker, Leonard,

Munson, Prescott, Tenney, Rogers, Tillotson, Bailey, Heath, Sumner, Davies, Pashley, Park, Cuthbert

Visitors Dr Lyman G Barton, President of the Fourth District Branch, Dr Arthur

professions concerned practicing in the vicinity may be benefited. Although the patient always receives first consideration, we are fully aware that his needs can be met adequately only through our co-operation with the medical profession

Many people are not familiar with the policies of the Buffalo City Hospital in regard to the reception of new patients, either in the wards or the Outpatient Department All applicants are rated either as pay, partly pay or free This is in accordance with Chapter 558 of the General Municipal Law of the State of New York, 1910. under which the Buffalo City Hospital operates This statute provides, among other things, that the Superintendent shall receive into the hospital any person who is sick, irrespective of whether the patient is able to pay or not, and that he shall cause to be made such inquiries as he may deem proper relative to the ability of part pay and free patients to reimburse the city for their care and treatment

The Board of Managers feels that the main purpose of the Buffalo City Hospital is to receive and treat only those sick persons who are unable to provide themselves with first-class medical care

and attention elsewhere We do not seek full pay patients, although the law states that we must receive them if they apply We do not compete with the private hospitals of the city, as we maintain no private rooms, and provide only one class of medical, nursing and food service. The location of the patient in the hospital is determined solely by his physical condition. The same is true of our Outpatient Department Here also we do not compete but rather co-operate with the practitioners of the County.

Your great interest in the subject under discussion is what prompts me to lay these facts before you. The University of Buffalo, acting in concert with our public and private hospitals and the medical and dental professions, is in a position to serve the best interests of the community by exerting its leadership for the promotion and advancement of preventive and curative medicine

Yours sincerely,

WALTER S GOODALE, M D, Superintendent Approved Edward J Meyer, M D, President Board of Managers

THE NEW MILK CODE

A new milk code, devised by the Departments of Health of the State and City of New York, in collaboration with representatives from other sections of the United States, goes into effect on July 1, 1928, throughout the jurisdiction of the New York State Department It simplifies the procedure of milk of Health inspection and establishes uniform standards throughout the State Its enforcement is primarily in the hands of local health officers and will afford an illustration of the responsibility of physicians for leadership and success in public health work About one thousand physicians of New York State are health officers in districts outside of Greater New York This means that one-half of the physicians of rural districts are health officers. All of these doctors have sworn to do their conscientious duty in the practice of public health and it is to their credit that they score high in that However, the individual scores vary, as they do in other activities, and those doctors whose scores are below the average are subject to just criticisms

Dr Frank W Laidlaw, District Health Officer for the district comprising the lower West side of the Hudson valley, has brought out the point of individual responsibility of health officers in his mimeographed Bulletin No 16, dated at Middletown, Orange County, June 15, 1928 This Bulletin is an example of the kind

of writing which strikes home to its readers, because it has the essential qualities of kindliness, truthfulness and clearness, combined with friendly frankness which appeals to practical doctors. Here is what Dr Laidlaw says in the Bulletin

"May 1, we issued a bulletin (No 14) containing 'A Few Observations on the Milk Code'

"May 10, we issued a 'Special Bulletin' intended for distribution to milk dealers and producers Every health officer was sent at least two copies

"May 26, we issued another bulletin (No 15) containing what we thought to be live information on the subject

"We believe that most health officers have read these bulletins, but we know that we have failed to hit the mark in some instances

"Occasionally we find a health officer who cannot remember having received any of them, nor can he recall that a sample set of blanks has been received. This set of blanks was sent from this office under date of March 20

"We find instances (not many, but they are altogether too numerous) of health officers who have not secured a supply of blanks, and in fact have done nothing,—who apparently expect milk regulation to proceed in the 'even tenor of its way,' as it has done in some districts for the past 14 years

Varney, Gow, Bullard, Cotton, Callahan, Derby, Ordway, MacElroy, Parmenteer and guests, Dr M L Diez, Albany, head of Division of Maternity and Child Welfare, State of New York, Dr Francus A Mastrianni, Mechanicville and Dr Frank Van der Bogart, Schenectady

Dr Francus A Mastrianni was elected a member

Dr MacElroy gave a detailed and final report on survey of defects of school children in the county

The President at this time called the attention of the Society to

- (a) The necessity of prompt payment of dues
- (b) Impressed upon members the necessity of answering attendance cards promptly
- (c) Called the attention of the Society of members of our Society, graduates of the '70's, two of whom were present and received a hearty round of applause They were

Dr John Cotton, Burnt Hills, graduated 1871—Harvard, in practice 57 years

Dr Allen G Peckham, Waterford, graduated 1871—Hahneman, in practice 57 years

Dr Frank F Gow, Schuylerville, graduated 1873—P & S, in practice 55 years

Dr R. H Stubbs, Waterford, graduated 1877

—N Y University, in practice 51 years

Dr Walter Crombie, Mechanicville, graduated 1879—Albany, in practice 49 years

Drs Cotton and Gow were present

Dr Maby called attention of the Society of a possible hardship for some of the older members to pay their dues, which might unreluctantly compel them to withdraw from the Society After some discussion Dr King moved, and Dr I edlie seconded, that Drs Maby and Bullard be a committee of two to present a proposed amendment to the By-laws as to Honorary Membership, same to be presented at the next regular meeting Carried

There being no further business, the following scientific program was presented

- 1 Pre-natal case—Dr M L Diez, Albany, Head of Division of Maternity and Child Welfare of N Y State
- 2 Grape Fruit in Diabetis—Dr D C Monarta, Saratoga Springs
- 3 County Medical Activities—Dr J R Mac-Elroy, Jonesville

This latter paper called attention to the necessity of better organization through the Medical Society to handle the Non-Tuberculosis ills and defects of the children of the county

Dr MacElroy moved and Dr King seconded that the President and four other members be a Committee to organize this public health activity Carried

Chair added Dr MacElroy to the present Public Health Committee, the Committee being Dr T J Goodfellow, Dr MacElroy, Dr Sherman, Dr Parmenteer and Dr Loop

Ralph Post, Secretary

CLINTON COUNTY MEDICAL SOCIETY

The semi-annual meeting of the Clinton County Medical Society was held Tuesday, May 15, 1928, at Plattsburgh Barracks, N Y

An unusual feature of this meeting was the fact that a program was arranged which would be of some interest to the dental as well as the medical profession, and an invitation was extended to all the dentists in Clinton, Essex and Franklin Counties Six responded

The meeting was begun with an informal luncheon at which twenty-four were present at the Witherill House, Plattsburgh, N Y, preceded the meeting

The following new members were elected Dr J E Swarts of Chazy, N Y, Dr G D Dare fo Plattsburgh, N Y, and Dr Wm C Schintzius of Standish, N Y

The business transacted was of a routine character, and was followed by the scientific program

- 1 Focal infection, by Roswell A Hogue, DDS, Plattsburgh, N Y
 - 2 Moving Picture, "Infections of the Hand"
- 3 The Little Things in Surgery, by Dr A M Dickinson, Albany, N Y
- 4 The Early Diagnosis of Tuberculosis, by Dr T R Plunkett, Albany, N Y

In the course of this paper, a motion picture entitled "The Doctor Decides" was shown

Leo F Schiff, Secretary

Dickinson of Albany, Dr Borrowman from Schenectady Dr Robert E Plunkett from the State Department of Health

Treasurer's report was received showing \$119 96 available

Dr Dougald F MacArthur was elected to membership

Dr Barton urged a better attendance at the District Branch and the State Society meetings and mentioned the excellent program of the meeting to be held in Albany

Dr Bennett presented his paper on "Appendicitis" He emphasized the importance of early diagnosis, and presented some case histories showing that we could not always depend upon book symptoms for our diagnosis

Dr Bailey presented his paper on "Medical Ethics" based upon what was presented at the meeting of the American Medical Association at Atlantic City several years ago

Dr Paris presented a paper, the matter of which was taken from a medical book published in 1636 showing the conditions in the practice of medicine in London at that date

After dinner, at the Granville Inn, Dr Plunkett read his paper on the early diagnosis of tuberculosis He gave the history of the disease and the attempts at its control, reviewed means of control in New York State, stating that the death rate had been reduced by education, and preventive measures, and essential steps in diagnosis, good history, good physical examination, and examination of sputum

A moving picture "The Doctor Decides" was

then presented

Dr Arthur Dickinson then presented his paper on "Bone Tumors" illustrated by lantern slides

Adjourned

S J BANKER, M D. Secretary

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Lebanon Hospital, on May 16, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the Chair

Election of candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot The following physicians were elected to membership. Irving B Blumenfeld, Julius Burstein, Nathan Cohen, Max Eisenstat, Herman Eeymour Frimel and John L

The following Resolutions were adopted

"Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Morris Klein, M D

"Resolved, That The Bronx County Medical Society record the sense of its loss in the death of Dr Klein and that a minute thereof be placed on the records of the Society, and be it

"Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member "

"Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Albert Vincent Rockwell, M D

"Resolved. That The Bronx County Medical Society record the sense of its loss in the death of Dr Rockwell and that a minute thereof be placed on the records of the Society, and be it

"Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member "

The Scientific Program then proceeded as follows

Climcal Meeting

- Pelvic Abscess with Unusual Etiology A J Rongy
- Gas Bacillus Infection Following Hypodermic Henry Roth
- 3 Case of Hypoparathyroidism Following Thyroidectomy (partial) Wm Weinberger roidectomy (partial) Win Wei Chorioepithelioma—Report of Three Cases
- M J Goodfriend M R. Bookman
- Dermoid of Testicle in a Child M. R. Bookman Case of Intrathoracic Tumor Carl Goldmark Cases of Post-tonsillectomy Hemorrhage I M. Heller
- Case of Epileptiform Seizures Associated with
- M D Lederman x S A Blauner Chronic Middle Ear Suppuration
- Case of Idiopathic Pyopneumothorax Harry Aranow 10 Specimen of Rhinocephalic Monster

It was moved and carried that a vote of thanks be extended to Lebanon Hospital and to the gentlemen who presented the Cases and Reports

I J Landsman, M D, Secretary

SARATOGA COUNTY

The regular semi-annual meeting of the Saratoga County Medical Society, held on May 16, 1928, was called to order after dinner at Newman's Lake House, there being present Dr T J

Goodfellow, President, Dr Post, Secretary, and Drs G F Comstock, Castree, Downs, Eaton, G F Goodfellow, Humphrey, King, Ledlie, D C Monarta, Maby, Sherman, Towne, VanAernem,

THE DAILY PRESS

PROFITS FROM CONVENTIONS

Why do cities we with one another to secure the annual meetings of the Medical Society of the State of New York? The answer may possibly be found in the following editorial from the New York Sun of May 29

"The Merchants Association knows more about delegates to conventions in this city than some of the wives of the delegates may know. It knows how much money they spent here and how they spent it. Collectively the delegates to 132 con-

ventions spent \$63,000,000 here The delegate's dollar was spent in this fashion 40 cents in the retail stores, 25 cents for his hotel bill, 15 cents in restaurants, 15 cents for amusements and 5 cents for taxicab fare

"That the average delegate spent so much in stores may astonish some people, but not anybody familiar with conventions. A delegate has to go somewhere and do something during the business sessions of a convention."

AMBULANCE CHASING

The investigations regarding ambulance chasing which apparently originated with the Brooklyn Eagle last winter, have extended throughout Greater New York and are being actively conducted by at least two courts. The disclosures seem at last to have become definite and to lead to a few physicians who are as guilty as the lawyers. In fact, the lawyers cannot get far with their cases in court without the connivance of physicians to give sworn testimony regarding alleged injuries.

The New York Herald-Tribune of June 19 has the following editorial which sums up the situation in a clear manner

"As a weapon against quacks the Webb-Loomis law requiring annual registration by physicians and forbidding the title "Dr" to the unlicensed is making good. Deputy Attorney Gerald Sol Ullman, reviewing the medical practice act in 'The Panel,' issued by the Grand Jurors' Association of New York County, estimates that more than 1,000 illegal practitioners were driven out of the state last year. Most of them did not wait to risk prosecution, but 'pulled up stakes and went elsewhere' State officials are confident that unauthorized use of 'Dr' either by signs or in advertising, has practically ceased

"The Webb-Loomis law also provides for the disciplining and ejecting of licensed physicians guilty of misconduct. One of the causes for revoking a license, 'fraud and deceit in the practice of medicine,' fits the cases of unscrupulous physicians in cahoots with equally unscrupulous lawyers. Mr. Ullman describes the joint enterprise of blacklegs of the two professions.

Recent disclosures have established that a so-

called "ring" of physicians has been in league with a number of "ambulance-chasing" lawyers These physicians, who generally received as their compensation part of the settlement or recovery in negligence claims or actions, were at all times ready to and did make false statements, false affidavits and false certificates Their testimony in support of the claims reeked with perjuy many cases the physicians who had not seen the alleged injured testified concerning fictitious in-They were invariably ready to perform any act required of them by the dishonest lawyer in order to aid such lawyer in his chicanery and thus increase the recovery in which there was a contingent interest The physicians who have been enabled under the cloak of their licenses to carry on this illegitimate and mercenary trade have cast discredit upon an honorable profession and constitute a scourge which is not to be tolerated'

"This subtle form of medical fraud easily evades the routine work of the medical inspectors who war on quacks Judges, however, get wind of it, and they can speed the expulsion of the fake testifiers by reporting the latter to the committee on grievances set up by the medical practice act Deputy Attorney General Ullman suggests that all governmental agencies running across crooked dealings by physicians forward their information to the grievance committee or to the Attorney General

"Their co-operation would be invaluable to enforcers of the medical law. Certainly the ambulance-chasing lawyers and the ambulance-chasing doctors, such as Mr. Ullman describes, should be thrown out the window together."

MEDICAL WARES

STOMACH TUBES

A picture of stomach pumps in action was a prominent feature of a farmers' encyclopedia three-quarters of a century ago It showed a physician in vigorous action working the piston of a suction pump attached to a rigid tube that extended into the stomach, while the patient with his head extended far back gazed into the physician's face with an angelic expression of gratitude Such a contrivance may have been used in cases of acute poisoning, but it would seem that only a choice of life or death could induce a patient to submit to the pump, or a doctor to use it As a matter of fact, almost the only use of such a stomach pump was that of removing poisons from the stomach

The objections to the stomach pump were many and obvious There was the evident danger of damage to the esophagus while passing the rigid tube, and there was the further danger of aspiration of the mucous membrane of the stomach by excessive suction

The invention of processes of vulcanizing the rubber enabled manufacturers to make a flexible stomach tube which could be readily passed, while the principle of the syphon provided a degree of gentle suction which could not be made forcible enough to do injury to the lining of the stomach

The manufacture of a stomach pump begins with the preparation of a mass of crude rubber which is plastic and has a considerable degree of adhesiveness. The quality of the finished tube depends largely on that of the crude rubber. Some rubber becomes hard within a few weeks or months, and develops cracks which catch and hold dirt and bacteria, but the best quality of rubber remains flexible for a long time, and retains its polish unimpaired.

The quality of the stomach tubes also depends on the substances with which the rubber is mixed in order to render it susceptible to vulcanization. The chemical composition of the materials is not the sole indication of the character of the finished tube. The skill and the honesty of the maker are very large features in the production of a stomach tube which will remain smooth and flexible for months or years.

The molding of a stomach tube begins with the forming of long sections of hollow tubing. The plastic rubber is placed in a hopper in which a screw revolves and forces the rubber through an outlet whose diameter is that of the outside of the finished tube. Projecting in the center of the

outlet is a pin whose diameter is that of the hollow in the tube. As the rubber is forced through the opening, it emerges as a tube whose length is dependent on the amount of rubber placed in the hopper.

The second process in the manufacture of a stomach tube consists in cutting the tubing in the proper lengths. The end of each section is then moistened with carbon bisulphide in order to increase its adhesiveness, and is pinched together and rounded with a snip of a pair of scissors Each section of tubing is now a closed tube consisting of plastic rubber which is ready for vulcanization

The rubber section, if the tube is of the best quality, is now inserted in a glass tube whose bore has the diameter of the outside of the finished rubber tube. The glass tube is a mold in which projections have been formed corresponding to the depressions in which the apertures in the distal end of the rubber tube are located.

The glass mold containing the rubber tubing is then sealed with a cap of flexible rubber, and is placed in a vulcanizer whose temperature is raised to about 500°F. The heated air in the tube expands and forces the plastic rubber firmly against the sides of the mold so that the vulcanized product is the shape and smoothness of the glass tube

The process of the manufacture is completed by cutting the holes in the depressions of the tube A soft rubber catheter is made the same way as the stomach tube

Practically all stages of the manufacture of stomach tubes and soft catheters are done by hand, and the skill and care of the workmen are great factors in determining the perfection of the product

The skill of the maker of the glass molds also enters into the uniformity of the completed tubes

The production of a high grade stomach tube or catheter requires skill in manufacture and knowledge of the materials of which they are made. These elements cost money, and account for the apparently high prices of the first class product. There is probably no other medical ware whose quality is so variable as that of goods made of soft rubber.

It will always pay the physician to purchase those made by a reliable firm whose products have been manufactured according to the highest standards of skill and knowledge

燩

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits or in the interests of our readers.

- SELECTED PAPERS ON INJURIES AND DISEASES OF BONE.
 By Sir William Ireland de C. Wheeler, B.A., M.D.
 Octavo of 148 pages, illustrated. New York, William Wood and Company, 1928 Cloth, \$400
- A TEXT BOOK OF INFECTIOUS DISEASES Being the Third Edition of Goodall and Washbourn's Manual of Infectious Diseases Revised and in large part rewritten by E W Goodall, O B E., M D Octavo of 718 pages, illustrated New York, William Wood and Company, 1928. Cloth, \$1000
- THE SIMPLE GOITRES BY ROBERT McCARRISON, CIE., M.D. Octavo of 106 pages, illustrated New York, William Wood and Company, 1928 Cloth, \$400
- Surgical Clinics of North America Vol 8, No 2 April, 1928. (New York Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.
- Gonococcal Urethritis in the Male. For Practitioners By P S Pelouze, M D Octavo of 357 pages, illustrated Philadelphia and London, W B Saunders Company, 1928 Cloth, \$500
- THE HEALERS By B LIBER. 12mo of 455 pages New York City, Rational Living, 1928. Cloth, \$3 00
- HEALTH AND WEALTH A Survey of the Economics of World Health. By Louis I Dublin, Ph D Octavo of 361 pages New York and London, Harper and Brothers, 1928 Cloth, \$300
- THE MIND OF THE GROWING CHILD Edited by VISCOUNTESS ERLEIGH 12mo of 229 pages New York, Oxford University Press, 1928 Cloth, \$1.75
- A Text Book of General Bacteriology By Edwin O Jordan Ph D Ninth Edition revised. Octavo of 778 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, \$600
- THE PRINCIPLES AND PRACTICE OF OBSTETRICS BY JOSEPH B DE LEE, A M, M.D. Fifth Edition, revised Octavo of 1140 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, \$1200
- MANUAL OF SURGERY (Rose and Carless) For Students and Practitioners By Albert Carless, C.B.E., M.B. and Cecil P. G. Wakeley, F.R.C.S. Twelfth Edition. Octavo of 1544 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$11.00
- THE EXAMINATION OF PATIENTS BY NELLIS B FOSTER, M D Second Edition revised Octavo of 392 pages, illustrated Philadelphia and London, W B Saunders Company 1928 Cloth \$4.50
- Physiology and Biochemistry of Bacteria Volume I Growth Phases Composition, and Biophysical Chemistry of Bacteria and their Environment, and energetics By R E. Buchanan Ph D and Ellis I Fulyer Ph D Octavo of 516 pages Baltimore, The Williams and Wilkins Company 1928 Cloth, \$750

- Folklore of the Teeth By Leo Kanner, M.D. Octavo of 316 pages, illustrated New York, Macmillan Company, 1928 Cloth, \$4.00
- A HANDBOOK OF HISTOLOGY By A McL. WATSON, M.A, Ph D 12mo of 207 pages, illustrated New York, William Wood & Company, 1928 Cloth, \$3.75
- THE INTERNATIONAL MEDICAL ANNUAL. A Year Book of Treatment and Practitioners' Index. Forty-sixth Year, 1928 Octavo of 574 pages, illustrated New York, William Wood & Company, 1928 Cloth, \$6.00
- THE NEW YORK ACADEMY OF MEDICINE LECTURES ON MEDICINE AND SURGERY [First Series, 1927] Octavo of 319 pages, with 39 illustrations New York, Paul B Hoeber, Inc., 1928 Cloth, \$500
- EPILEPSY COMPARATIVE PATHOGENESIS SYMPTOMS, TREATMENT By L. J. J. MUSKENS, M.D. Octavo of 435 pages, illustrated New York, William Wood & Company, 1928 Cloth, \$8.00
- LABORATORS MANUAL FOR THE DETECTION OF POISONS AND POWERFUL DRUGS By DR WILHELM AUTENRIETH Authorized translation by William H. Warren, Ph D Sixth American Edition from the Fifth
 German Edition, completely revised with extensive additions Octavo of 698 pages, with 60 illustrations
 Philadelphia, P Blakiston's Son & Company, 1928.
 Cloth. \$600
- MEDICAL CLINICS OF NORTH AMERICA. Vol 11 No 6 May, 1928 Index Number (Mayo Clinic Number) Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.
- BED-SIDE MEDICINE. A Hand-Book of Medical Diagnosis—Symptoms, Physical Signs, and Laboratory Methods—From Indian Standpoint. By AKHIL RANJAN MAJUMDAR, MB 12mo of 443 pages, illustrated Calcutta, The Book Company, Limited, 1928. Cloth, Rs 6-8
- EAT, DRINK AND BE HEALTHY An Outline of Rational Dietetics By Clarence W Lieb M.A., M.D. 12mo of 180 pages New York, The John Day Company, 1928 Cloth, \$1.50
- THE GLANDS REGULATING PERSONALITY A Study of The Glands of Internal Secretion in Relation to the Types of Human Nature. By Louis Berman, M.D. Second Edition, revised Octavo of 341 pages. New York, The Macmillan Company, 1928 Cloth, \$3.50
- URINARY ANALYSIS AND DIAGNOSIS BY MICROSCOPICAL AND CHEMICAL EXAMINATION BY LOUISE HEITZMANN, M D Fifth revised Edition Octavo of 366 pages, illustrated New York, William Wood and Company, 1928 Cloth, \$500

LABOR OR MEDITATION

Preachers and physicians and social workers all deplore the hurry and haste of modern life, and University Deans try to arrange the curricula in order to allow the student more time for reflection. The philosophers of India have demonstrated the uselessness of reflection and meditation unaccompanied by action, while the intensely active business man has little use for the dreamer of dreams. The busy doctor, called

"Man first devised the water-wheel
To free himself from toil,
He made the river grind his meal
And irrigate his soil
Since Adam's day, when man has not
Been flourishing the saber,
He's spent his time on plan and plot
To saye himself from labor

Because he'd rather drowse and dream
Than plod o'er hill and dale,
He utilized the power of steam
And made his trips by rail
When lifting stones by might and main
Fatigued his brawny shoulders,
The slothful wight devised a crane
Which hoisted even bowlders

to an emergency case, has no time for reflection,—he must "Do something" quickly Still there is a time to act and a time to think, and the wise doctor takes time for both

The following verse by James Montague, in the Department of "More Truth Than Poetry" of the New York Herald-Tribune, of June 18, expresses the balance of labor and meditation better than a prosy scientific article could do

Because he did not want to yell
To make his wishes known,
He sat and pondered for a spell
And built a telephone
But stringing poles is no light job,
And man is far from tireless,
So soon he set the air athrob
By sending calls by wireless

In youth we've bidden not to shirk,
Our noble leaders state
That only hard and wearing work
Will ever make us great
But though in economic lore
I own I'm pretty hazy,
It seems to me we've done far more
Than if we'd not been lazy"

TRASH-BASKET CIRCULATION

Every Journal, the New York State Journal of Medicine included, receives an astonishingly large amount of press notices which are sent by propagandists. Now and then an article is worth printing, but most of the clippings go into the waste basket. If every item were printed the Journal would burst with that kind of matter. It is a simple example in arithmetic to calculate how much of the propaganda material can be used. Five per cent would be a high figure. The New York Times of May 30 commenting editorially on the condition says.

"Of the 'more than \$227,000' which publicutility propagandists told the Federal Trade Commission was spent in New York State since 1922, it is probable that nearly all was wasted Part of the sum was expended for public school textbooks, when principals were credulous enough to accept them Some of the money was expended on a periodical bulletin 'which attained a circulation of 196,000 among newspapers' etc

"If the Federal Trade Commission will circularize any fifty editors in the country, it will discover that the first duty of their day is to chuck away clip-sheets of this kind. Yet business interests with a special tale to tell will continue to

nourish publicity departments engaged in just such wasteful absurdaties, and their executives will continue to be told of 'more than 196,000 circulation'. That kind of circulation is comparable to the marksmanship involved in discharging a battery of machine guns at the ocean.

"Much that is interesting and important has been revealed in the commission's inquiry, and there are always instances to be found where direct contact has been made by special interests with purveyors of public information in a way not salutary to the general welfare. But clipsheets and textbooks are important only in that they give employment to the sharpshooters of the trash-basket brigade."

In answer to the editorial, it is true that press notices and clip sheets are used widely by newspapers. When this Journal subscribed to a press clipping bureau a dozen identical clippings would be received whenever the State Charities' Aid Association issued a press notice. Granting that only five per cent of the notices are printed, the total is an impressive amount of publicity and advertising.

Propaganda notices are useful as space fillers, as well as for building fires

A TREATISE ON ORTHOPEDIC SURGERY By ROYAL WHIT-MAN, MD 8th Edition, revised Octavo of 1051 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$9 00

Eight editions of Dr Royal Whitman's Orthopedic Surgery have been published since 1901, an average of almost one edition every three years. In view of the fact that this work is the product of one mind and not a system of medicine or the work of several authors and that it has maintained its position as a standard text from the first edition to the present one renders it conspicuous in medical literature. This book is the outstanding text for orthopedic surgery in the English

language and is recognized generally as authoritative.

The general character of the book is unchanged and many of the illustrations are familiar. Here is a work that was so well done in the first edition twenty-five years ago that the author never has had to completely rewrite it and change its basic character The classifica tion under functional disability of the pathology considered still persists and is probably the best form in

which to present the subject to the student

However much has been added as the scope of or-thopedic surgery has increased and the chapter on collateral orthopedics has been amplified and enlarged For example the section on ratings for amputations fractures and their sequelae has been added and will be found of great value to the industrial surgeon. The be found of great value to the industrial surgeon figures given are a compilation of the ratings in Europe and America.

Both Dr Whitman and the publisher are to be congratulated on the production of the eighth edition

MINOR SURGERY BY ARTHUR C HERTZLER, M.D., and VICTOR E. CHESKY, A.B., M.D. Octavo of 568 pages, with 438 illustrations St. Louis, The C. V. Mosby Company, 1927 Cloth, \$10.00

One gets the impression after reading this book that the author writes from first-hand knowledge of most of the topics There are many points of differential diagnosis gained by him through long experience, which are of great value to the man in general practice who sees first many pathological conditions but whose opportunity

to see many similar cases is naturally limited.

The chapter on Diseases of the Tongue is well worth perusal. The chapters on Affections of the Scalp and Cranium, Diseases of the Nose, Mouth and Jaws, Face and Neck contain much information not found in text books The other chapters are also replete with information and contain many suggestions of value. Perhaps the discussion on the treatment of Flatfoot had better been left for the orthopedic surgeon.

The book deserves careful reading. The author has made a real contribution to medical literature.

S LLOYD FISHER

EVOLUTION OF PREVENTIVE MEDICINE. By SIR ARTHUR NEWSHOLME, K.C.B., M.D. 12mo of 226 pages Baltimore, The Williams & Wilkins Company, 1927 Cloth, \$3 00

Sir Arthur Newsholme gives us an interesting brief outline of the most important steps in the development of preventive medicine. Sir Arthur has well-arranged his work in this book. He leads us from the obsessions and supernaturalism controlling the Medical World of old and the emancipation from the old authorities Hipvesalius and others He shows us how medicine, through its alliance with science in the realm of physics and chemistry, has progressed up to the twentieth century, the history of which he has wisely left for another volume Before us is clearly displayed the progress made in preventive medicine from the first control of leprosy in the eleventh and twelfth centuries to the control of plague, cholera, small pox, typhoid fever and also the control of the food deficiency diseases

This book makes such interesting reading that we are

left waiting with great impatience the appearance of the subsequent volume. WILLIAM RACHLIN

A Sound Economic Basis for Schools of Nursing AND OTHER ADDRESSES By MARY ADLLAIDE NUTTING RN, MA Octavo of 372 pages New York and London, G P Putnum's Sons, 1926 Cloth, \$250

This is a collection of addresses by Miss Nutting and may be considered as an interesting compendium of the doctrines which have actuated the present leaders of nursing. In its pages one may clearly trace their wanderings in pursuit of the will-o-the-wisp of theory, a progress now rapidly leaving to other hands the actual care of the sick. A little more naive, a little less com-promising and a little less hampered by doubts or fears, the female of the species is in no marked essential different from her brother, the physician when matters of education are concerned. The book should be read and studied. It is an illuminating document full of high idealism, intellectual snobbery and of impractical bunk.

TONIC HARDENING OF THE COLON BY T STACEN WILSON, M D Octavo of 210 pages London and New Oxford University Press, 1927 (Oxford Medi-York cal Publications)

This book of two hundred pages is devoted to a long discourse on a condition of the colon, supposed to be an exaggeration of a normal "Static Fixation of the protoplasm of the muscular fibers of the colon," which the writer considers a part of normal colonic peristalsis is recognized by palpating the colon and feeling it to be thickened and hard and at times tender. This hardening according to the writer, is very frequent, and may be caused reflexly by many abdominal conditions and may be the cause of a long list of symptoms. The treatment recommended consists of giving atrophine, sedatives, rough diet, mental suggestion and what have you Fortunately books of this type, devoted to a consideration of symptoms, with no scientific explanation of their cause or treatment, are becoming fewer and fewer

DEMONSTRATIONS OF PHYSICAL SIGNS IN CLINICAL SUR-GERY By HAMILTON BAILEY, F.R.C.S Octavo of 217 pages, with 261 illustrations New York, William Wood and Company, 1927 Cloth, \$650

In an age when the laboratory is over-stressed, it is refreshing to be able to say a word of commendation for

a simple text with the above title.

The chapters may be perused one by one without a feeling at any time that the waters are getting too deep The technique of laboratory tests today has become so involved that the average reader is lost in the maze of reactions unless he is of the initiated No such complaint can be made of these chapters. They give a resume, both general and regional, of the basic physical signs so valuable in clinical surgery

The usefulness of the text should earn for it an important place in the library of the active surgeon or gen-ROBERT F BARBER. eral practitioner

PIUM By JOHN PALMER GAVIT Octavo of 308 pages New York, Brentano's, 1927 Cloth, \$3.50

To most of us, the word opium suggests something as vague and unknown as the very lands from which the product comes But Mr Gavit lifts a curtain upon the immensity and vastness of the horrible menace of opium No longer is it a danger to only the far-off Orient -it is a danger in civilized lands where those who enter into the difficult task of solving the problem of its traffic become lost in a fog of hundreds of questions which come up under this one head, which to the average person seems so simple and but a question of prohibition of sale. This is a book for everyone to read and-we strongly feel that once one has perused its pages, no longer will the word opium mean danger in lands across the seas but it will open a new trend of thought and become a far-reaching topic of personal significance M L. A

(Chicago Number)

Published every other month by the W B Saunders Company, Philadelphia and London, Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.

Vol 7, No 1 A very interesting and well illustrated contribution on the subject of cancer written by men associated in research work in the City of Philadelphia with an added paper by W Sampson Handley, MS of London, England This volume covers the subject of bone deposits in Cancer, Cancer of the Face, Metastatic Tumors of the Nervous System and the rest is given over mostly to presenting the superficial forms of Cancer and their Radium treatment. The final chapters deal more particularly with the preparation of Radium Seeds, etc, which is very interesting. The chapters dealing with the Angiomata, Facial and Tongue Cancer brings the treatment up to date in a very clear cut manner

Vol 7, No 2 A small but very interesting report on the Cancer problem furnished by the Philadelphia General Hospital based on the series of cases coming under their care in recent months. The volume covers a variety of types of Cancer in the various Organs in connection with which are many valuable hints in diagnosis and treatment. The use of Radium and X Ray is carefully outlined by those who have had much experience in these The Cancer problem is well covered in a very readable manner

Vol 7, No 3 This volume covers a multitude of subjects—Fractures of the Skull and Tumors of the Brain Tumors of the Parotid Gland, Bone Surgery together with various phases of Abdominal and Chest Surgery, as well as those of the Specialties They are all well written, with a sufficient number of illustrations to make easy and well worth while reading

MEDICAL CLINICS OF NORTH AMERICA Vol 11, No 1 July, 1927 (Chicago Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net

This volume covers a wide field of medicine illustrating important conditions as seen by the Chicago physicians. All of the papers presented uphold the reputation and qualities of the contributions to the Medical Clinics. The most important conditions of pediatrics are given here, and Syphilis with its varied manifestations is treated. The influence of the glands of internal secretion is clearly explained in an article by Hutton. The diseases of the digestive tract such as peptic ulcer, cirrhosis of the liver, carcinoma of the pancreas, simple illcerative colitis, amebic dysentery, and obstruction of the duodenum by bands of adhesions, are thoroughly reviewed in these articles

Medical Clinics of North America Volume 11, Number 2 September, 1927 (St. Louis Number) Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.

In this issue by the physicians of St. Louis, we find much in pediatrics, and abnormal conditions of the nervous system The subject of peptic ulcer is carefully presented Coronary thrombosis in the milder forms is illustrated in this number. The subjects are varied and wide in range and present an excellent volume

MEDICAL CLINICS OF NORTH AMERICA. Vol. 11, No 3, November, 1927 (Tulane University Number) Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (b Cloth, \$1600 net, paper, \$1200 net.

This is an excellent volume of these Climes The subjects of Measles and Scarlet Fever are presented with the most recent findings. An article on Plague gives a clear description of the methods used to keep this disease out of the United States and the care which these patients receive Purpura, as a cardiologic problem, is the title of a presentation of ten cases of purpura due to different causes—a paper of unusual interest All of the other papers are well-written and instructive This is a valuable volume

HENRY M MOSES

ASTHMA Its Diagnosis and Treatment. By WILLIAM S THOMAS, M D Octavo of 279 pages, with 20 illustrations New York, Paul B Hoeher, Inc., 1928

This book could well be read by all general practitioners to their advantage. During twenty years of practice, hospital and private, the reviewer knows of no group of patients who have received worse treatment than those suffering from asthma. This book describes the new way to diagnose and treat asthma It describes asthma as an allergic reaction, due to the entrance into the body of a foreign substance, probably a protein, to which the patient is sensitive. This sensitivity is inwhich the patient is sensitive. This sensitivity is in-herited, not acquired. The substance enters the body through the respiratory system, as an inhalent, or through the gastro-intestinal system as a food. He describes in detail the method of skin testing, using the scratch method, through which this sensitivity is established

A group of asthmatics who do not respond to skin tests for inhalents or foods is the bacterial group His chapter on testing against bacteria, and treating with the same, will find many opponents among allergists All will agree, however, that there is such a group, some of whom do respond to some form of vaccine therapy

The doctor stresses the importance of taking a complete history in each case. His schematic history card is sufficient. He also stresses the importance of doing a complete physical in each case, especially noting the condition of the nose, throat and sinuses to a thorough chest examination an X-ray of the chest is often advisable. He dismisses the drug treatment of asthma in a few words, adrenalin, ephedrin and morphine, however, are very valuable. The latter, however, should rarely be used because of the danger of forming the habit. His results from the use of ephedrin are much better than we seem to get. It is, however, a valuable was the first than The book is well gotten up, has a good able drug index and bibliography, and is not too long It can easily be read in two hours GAM

SURGICAL DISEASES OF THE GALL-BLADDER, LIVER AND PANCREAS AND THEIR TREATMENT By Moses BFHREND A.M., M.D. Octavo of 278 pages, illustrated Philadelphia, F. A. Davis Company, 1927 Cloth, \$4.00

This book contains 250 pages, about 100 of these are occupied by illustrations many of which are devoted to diagrammatic representation of anomalous biliary vessels and ducts. The paper is good, the print is large and such ideas as it contains are far apart.

What?

Milk with a Bacterial Count of Less than 100 per c.c.?

DRYCO is the milk of which this enviable record is true! The bacterial count is consistently below 100 per c.c., and these are harmless spore-formers! This information is valuable to every physician who wishes to avoid the incidence of milk-borne infections which are especially prevalent among infants during the warm weather.

It is significant as to the merit of Dryco, that it has for years been prescribed by physicians all over the world. They know that it can be depended upon for good results and is of especial value in difficult feeding cases. In addition to other points of superiority, Dryco is highly antirachitic, due to irradiation by the ultra violet ray.

MICHIGAN CONFERENCE OF COUNTY-SECRETARIES

The secretaries of the county medical societies of Michigan hold yearly meetings at the expense of the State Society after the plan of a similar conference in New York State, the last one of which was reported in this Journal for October 1, 1927, page 1094. But the scope of the conferences in Michigan has been broader than that of New York State, a greater variety of subjects has been covered and the sessions have lasted longer. The Michigan meeting of 1927 was reported in this Journal of July 15, 1927, page 816, and that of 1925 was reported in the issue of August 1925, page 880.

The report of this year's meeting fills over forty pages of the June issue of the Journal of the Michigan State Medical Society. The meeting was held on May 14, 1928, in Detroit, and began at 215 o'clock and ended at 925, with two

hours' intermission for a social supper

Dr H E Randall, President of the Michigan State Medical Society, in opening the conference, said

"A state society has four functions to perform

"(1) To educate the doctors, to educate each other by exchanging experience, by reading papers, (2) Education of the public. These two are related, because the more you educate the public the more they have confidence in the doctor. At the same time it stimulates the doctor to live up to the confidence the patient has (3) To protect the welfare of its members. Of course that is done in your legislative work and also through your medico-legal committees. (4) To keep doctors together, to keep them friendly to each other.

"That medical organization has been a success in America is evidenced by the fact that a few years ago the average income of doctors in the United States was \$700 a year. The last figures we had showed that the average doctor's income is something like \$3,000 a year. At the same time, the doctor has received more, but the public has also received more.

"No man, no matter how much he can possibly contribute to medical organization or to medical knowledge, can repay the debt that he owes to medical societies and to the men who have given him this knowledge"

Dr F C Warnshuis, Secretary of the State Medical Society, speaking on the subject "Organized Activity", said —

"Two types of duties are ours First, those pertaining to the professional side and professional features of our work, second, those pertaining to our relationship to the public and the public's relationship to us

Regarding the Journal Dr Warnshuis said

"Dr Dempster is editing the scientific end of the Journal up to and through the editorial pages. The Council, however, still has placed upon the shoulders of the Secretary the burden of the management of the Journal, the printing of the Journal, the advertising business of the Journal, and also that section of the Journal that is devoted to the County Society reports or purely organizational activities

"You also know about the medico-legal defense of our Society, which has been in existence for a good number of years. The success of that feature of our organization is so well established that none of us would think of abandoning it. Many of us little realize the value and the protection that it gives. It is not until a man is sued for malpractice that he commences to appreciate that value of medical defense in the manner in which he is defended in his malpractice suit.

"The Joint Committee on Public Health and Education is constituted of a representative from our State Medical Society, the University of Michigan State Tuberculosis Society, the Michigan State Dental Society, the Michigan State Nurses' Association, and one or two other wel-

fare organizations of the state

"The object and work of this Committee is to disseminate to the lay people of our state the truths of scientific medicine. It has enrolled some 300 or 400 speakers from among our membership of the state who are able to go and are ready to go out to any lay organization and talk upon any subject of scientific medicine. The enrollment of these speakers is compiled in a program, and the assignment of places and appointments are made through the Extension Department of the University of Michigan

"This program, containing the list of 300 speakers, together with the topics upon which they talk, has been sent and is sent each year to every Parent-Teachers' association in the state, to every Grange organization in the state, to every noon-day luncheon club, and to many of these little community clubs, literary societies, and welfare organizations that are in existence. They are advised that they may select one or as many as they want of these speakers for any meeting that they may sponsor, and that the speaker will come and talk to that audience upon these subjects that are enumerated in the program, without expense to

(Continued on page 826, adv r)

(Continued from page 826-adv x)

"Some questions may be raised, especially on this chauffeur's examination license bill, that was passed requiring every chauffeur to have a physical examination and wherein the law set the fee at \$3 We will agree with you that \$3 is not a proper compensation for a physical examination of a chauffeur, but when you look at the degree and extent and scope of that examination, it is a part compensation, and it was a darned sight better as an agreement to accept the \$3 clause than to have the state appoint one or two medical examiners to make these examinations on an annual salary basis Sometimes compromises have to be made I believe that was one of the compromises that was made, not with the intent of appraising the value of the doctor's service in making the examination, but to defeat the institution of state officers who were going to make the examination

Dr Warnshuis also described the work of the committee on Post Graduate Education and said

"Some years back we started with the idea of sending to County Societies teams that conducted scientific programs. This, for several reasons, did not prove very satisfactory. Though it was realized that their services were of value, the application in that form did not serve the purpose that was being sought.

"Then instead of county meetings we started the post graduate conferences in the Councillor Districts—one-day sessions. These have proven to be very successful, they have proven to be very acceptable to the men, and they have been eager and anxious to have them. They have been conducted every year for the past four years, to the number of fourteen and eighteen, and in one year twenty-two, throughout the state. They are being so conducted this year.

"In addition to the post graduate conferences, arrangements were made two years ago, you will recall, for a post graduate clinic at the University Hospital for two and a half days. It was repeated last year and had a splendid response in attendance

Dr Warnshuis said that the post graduate clinic plan "Tends and leads to the establishment of an all-year post graduate school to which our members may come and pursue a course of post graduate study, spread over the year, according to the time that they can devote to it during the year For illustration, a man may come for a couple of days and take a course in heart conditions, we will say, and take a couple of days' work this week, then two weeks later he may come back to take a couple more days, and two weeks later a couple more, so through the year he may spend a definite amount of time and pursue a definite course of study at this post graduate school"

The subject of securing attendance at county

A Sure Source of Vitamins A and D

Tested for Your Protection

Clinical evidence has demonstrated the high vitamin potency of Patch's Flavored Cod Liver Oil. It has received nation wide professional endorsement. But that is not enough! We must test every lot of oil made in our plants to guarantee its vitamin potency

Vitamin A Guarantee

The least amount of cod liver oil required daily to promote a renewal of growth in albino rats that have ceased to grow and may show symptoms of malnutrition, such as reported as one diets adequate except for vitamin A is considered as one vitamin A unit. We guarantee more than 500 vitamin A units per gram.

Vitamin D (Antirachitic) Guarantee

The Antirachitic or vitamin D potency of this oil is determined by a modification of the method described by McCollum, Simmonds, Shipley and Park. The least amount of cod liver oil required daily during a period of eight days to promote recalcification in the tibia of young albino rats suffering from experimental rickets is considered as one vitamin D unit. We guarantee more than 75 vitamin D units per gram

While the quantity and quality of available sunlight may or may not be adequate to meet the needs of growing children here is a sure source of vitamin potency

them except that they are to bear the expense of

their communities

providing the meeting place
"That is a wonderful opportunity to convey to the public some of the truths of scientific medicine and to combat the misleading allegations and statements and claims of those who attempt to practice medicine or who attempt to treat the ills of humanity through the various schools of cults that are in existence. It has been felt by those who have sponsored this work that if we can edu cate the people as to the truths, then in their own judgment and wisdom they will no longer seek the administrations of those who are ill prepared to take care of them

"I said I was afraid that many of you did not know what was being done, because these meet ings are not being held as often nor in as great numbers in the various counties of the state as It is one of the things that the State Council would like to have the County Secretaries do To cause some of their local lay organi zations to secure some of these speakers and to conduct some of these public health meetings in

"In addition to that, the same Joint Commit tee believes in teaching the young and converting them to the truths before they are misled and misguided by these cult organizations first in a couple of our cities, and extending to most of our high schools-not all, but as rapidly as possible—this Joint Committee is conducting a series of six to eight talks at a general assem bly of the high school students of the high schools of our state, talking to them on such subjects as Pasteur, his life and his influence, and conveying to them through that subject of Pasteur, the story of bacteriology, Lister, and conveying through Lister's life and what he accomplished the story of surgery, and through similar topics they are conducting in the high schools of our state a series of six to eight lectures in the year for the education of the high school students I think you perceive the benefits and the educational features that are being obtained from that type of public health education

"The President of your State Society, your Secretary, the members of the Frecutive Com mittee of the Council, have been at Lansing dur ing the session of the legislature, not once, but all the time In addition to that, your State Society employed, without anyone's knowing he was there for that purpose, a well known attorney who represented our interests, who sat in on committee hearings, and who had individual and personal conferences with members of the legislature, who interviewed the Governor, the Lieutenant Governor and the Speaker of the House, and who obtained in that way their assistance for the defeat of undesirable legislation

(Continued on page 827-adv x1)

(Continued from page 828-adv \11)

bers take a more personal interest in community activities, and we feel that the influence of the Society is being felt, because of the frequency with which our officers are called upon for their opinion, on matters concerning the public welfare

"Our members feel that one of the most effective means of securing community support is

through newspaper publicity

"Following our meetings we have provided the newspaper with a summary of the papers presented, together with such other information relative to the meeting that we think may have some news value

"In the final analysis, the support of the community toward the organized medical profession is dependent largely upon the physician himself. In many communities the public has lost faith in the doctor because of a false idea of his duty to the public—possibly because of a lack of sympathetic understanding toward the patient."

Dr Harry B Knapp, in discussing attendance at society meetings, said

"The salient point in getting attendance, it seems to me, is to have an evening dinner preceding the meeting. Since that has been instituted, I notice that our attendance records have been better. We invite everybody, of course, to get in on these meetings, they don't all come. One dollars and fifty cents for the dinner looks pretty big to some, but the dinners at least afford a place for social contact, and I think more and more the men are taking advantage of the dinner meetings.

"The programs begin at eight o'clock A careful check is made on everybody who attends I keep an attendance record just as strictly as an old maid school marm does of her children I believe that is a very important thing After a meeting, a letter is usually sent out to those who did not attend, telling them that we missed them If we did not, we tell them that anyway, that gets under their skin pretty well A good many of them feel that we really missed them, at least we have noticed they were not there.

"Some come and sit and listen, some come and sit. When they sit and we notice their chair is occupied, we give them credit for attendance"

Dr Knapp also described a bill collecting plan as follows

"I have tried to render a little service to our Society also in the organization of a Bureau of Credits and Collections

"We have organized a bureau in our county, and we are undertaking to find out and list the kinds of people who are undesirable, not to keep them from getting service, but to find out who they are and then refer them to the poor commissioner for attention, where they belong

"Our bureau is simple. We get a collecting (Continued on page 830-adv viv)

society meetings was summarized by Dr R G B Marsh of Tecumseh, as follows

"In conclusion, I believe that attendance at County Medical meetings can be increased by the following methods

Hold the meetings every month at the same time each month

Choose an attractive place for the meeting

Have the meetings in different towns in the county This evens up the distance the men have to travel It also keeps the public informed of our existence

Obtain the best possible speakers the man the more quickly will he consent to come.

Have a dinner at each meeting. This is good for the speaker as well as the local men

Have at least four combined scientific and so-

cial meetings

Have the scientific program and the speakers published in the Journal at the beginning of the

Have an annual banquet with a non-medical program Invite to this meeting some other professional group, such as the Bar Association or the Dentists of the County

The Secretary should, I believe, be one of the younger members and his term of office should

be for at least two years

Invite to one of your meetings each year, and see that he gets there, your district Councilor, the State Secretary, and if possible the State President Also keep these men informed of your activities because they will help you when you need help most

Last of all use plenty of different kinds of bait to lure the men to the meetings and then do not forget to show them a good time and send them home feeling that the effort to attend was well worth while

The topic "Securing Community Support" was presented by Dr Charles A Neafie of Pontiac who said

"To secure community support there are two factors of the utmost importance, the first, that the members of the society take an active part in the life of the community, and the second, that the society arrange for suitable publicity, in order to furnish the general public with information regarding the activities of the society, and reliable information as to the progress of medicine.

"The work of our physicians in connection with the lectures given as a part of the Health Education Program, under the auspices of the Joint Committee on Public Health Education, has been of great value and it should be the aim of each County Society to encourage its members to take part in this important phase of health

"It is the aim of our Society to have its mem-

(Continued on page 829 adv xm)

(Continued from page 830-adv xiv)

quarter or a half million dollars invested in good securities that will yield on an average of five, possibly five-and-one-half per cent, which will give us an annual income of somewhere in the neighborhood of \$30,000 to \$40,000 which will enable us to carry on the work of our state organization. When that foundation has been completed and that investment made, I think then we can reduce our state dues to a minimum."

The practice of medicine by institutions came in for criticism Dr Woodward of Detroit said

"One of the most serious problems confronting the larger societies of medical centers is the endeavor to combat medical service by institutions. We are in the throes of that in the city of Detroit. There is no question but that this problem becomes more or less acute, depending upon the size of the community in which you practice. It seems to have simmered down to a battle between big business and small business, the small business being represented by the general practitioner, the man around the corner, and the big business being represented by various state institutions that are being run as the result of foundations that have been endowed."

The University of Ann Arbor was mentioned

by Dr Warnshuis as follows

"Much criticism has been raised also regarding some of the methods of the University Hospital That is a criticism that has existed, I guess, ever since the University Medical Department has been in existence, and it may continue to exist It has an interesting linking, impinging contact with not only the doctors, but with everybody in Michigan, with the legal profession in Michigan, with the County Charity Boards, and the Health Departments It is a problem that has grown as the years have advanced, and has attached to it many tentacles that are hard and barnacles that are difficult to tear off. It cannot be accomplished or wrought in one night, one week, or one year."

Dr Warnshuis also said
